The monthly returns rendered to the Commissioners in respect of the generating stations of authorised undertakers in Great Britain, including the voluntary returns in respect of generating stations owned by railway and tramway authorities and by a number of non-statutory undertakings, during the year ending March 31st, showed that 570 stations represented 9 927 850 630 units, with a fuel consumption of 9 034 323 tons of coal, 149 721 tons of coke breeze, and 40 107 tons of oil fuel. The returns bear evidence that there was a rapid recovery, as regards output and operating results, from the adverse effects of the prolonged coal strike in the preceding year. The output (units generated) showed an increase of nearly 18·7% on the figures for 1926-27, the larger output being obtained by an increase of only 5·4% in the amount of coal and coke consumed. The resumption of more normal conditions was also accompanied by a falling off in the use of oil fuel at generating stations, the consumption in 1927-8 amounting to 40 107 tons, as compared with 145 911 tons in 1926-27.

Notwithstanding the restrictions on the industrial demand for power supplies and the retarding effect on the rate of growth of output caused by the fluctuating conditions of trade and industry during the past eight years, the preceding figures and those given in prior reports show that the production of electricity at the stations included within the scope of the returns has practically doubled since 1920-2. They also show that there has been an all-round increase of the order of 54% in the amount of electricity produced per ton of coal and coke consumed for that purpose, as compared with the technical practice in 1930-21.

An analysis of the generating stations to which the par-

Digitized by Google

ticulars relate shows that of the 570 stations, 251, or 44% of the total, generated less than 1 000 000 units each during the year, while 400 stations, or 70·2% of the total, generated less than 10 000 000 units each. The remaining 170 stations with individual outputs of 10 000 000 or over were collectively responsible for as much as 93·6% of the total units generated.

With regard to the sale of electricity in Great Britain by authorised undertakers, local authority undertakers sold 4 330 641 132 units, and company undertakers 2 519 521 676, the total of 6 850 162 808 showing an increase of 87·9% on the 1922 figures.

A comparative table shows that there was an increase of about 19·6% in the sales of electricity by authorised undertakers as compared with the figures for 1926. On the basis of the estimated total population of Great Britain at the end of 1927, namely 44·18 million, the sales of electricity from public sources of supply in that year thus represented an average consumption of 155 units per head of population.

The operations of privately owned plant do not come within the scope of the statistical returns which the Commissioners are empowered to obtain under the Electricity (Supply) Acts, and no official records are available as to the annual consumption of electricity generated by such plant.

Plant for Industrial Purposes.

A valuable indication of the extent of the electrical generating plant installed for industrial purposes in 1924 in factories and other works in Great Britain is afforded by the preliminary reports on the third Census of Production, 1924, issued by the Board of Trade during the past year. An analysis of the particulars relating to electrical and mechanical equipment contained in these reports is given in a memorandum forming an appendix to the present report.

The figures show that the industrial generating plant installed in 1924 amounted to about 2 564 000 kW, as compared with 3 943 000 kW in the case of authorised and non-statutory electricity undertakings supplying mainly for sale to the public. The generating resources of trade and industry in that year thus represented an addition of about 65% to the resources of electricity supply undertakings.

The preliminary reports do not embody particulars of the production of electricity in 1924 from the generating plant of industrial organisations, but indicate that the returns received by the Board of Trade under that heading will be summarised in an analysis of the final results of the census.

At the date to which this report is made, the representations received by the Commissioners were under consideration. Dealing with the adjustment of production costs for selected stations, it is stated that the question of the allocation of production costs as between fixed and running costs was given preliminary consideration by the Commissioners at an early stage, in view of its bearing upon the preparation of the financial estimates for inclusion in the supplementary particulars put forward in support of the regional schemes. It was appreciated by the Commissioners that the subject presented difficulty and lent itself to a divergence of views; and this was rendered evident by a study of the bases of allocation adopted in practice or proposed by a number of the leading electrical engineers. In order to obviate delay in the preparation of the schemes, the Commissioners accordingly found it necessary to make use, for purposes of illustration, of a basis of allocation for which they considered the best justification could be shown on the data then available.

The Commissioners subsequently pursued their investigation of this matter and of the related question of adjustment in accordance with power factor, with the object of determining whether practical bases of allocation and adjustment could be devised to give equitable results as between the Central Board and the owners of selected stations under all conditions of load factor and power factor. In the course of this investigation, the Commissioners came to the provisional conclusion that the necessity for a regulation prescribing variations in the fixed kilowatt charges component in accordance with the magnitude of the maximum demand of the supply taken was not likely to arise, at any rate until after some years' experience of the actual working of the regional scheme. These matters were still under consideration at the date to which this report is made.

The aggregate capacity of the generating plant for new stations and extensions of existing stations sanctioned by the Commissioners during the year 1927–28 amounted to 668 357 kW. While the amount of plant sanctioned for new generating stations was greater than in the previous year, the amount sanctioned for extensions of existing stations was smaller by about 118 000 kW.

Of the generating plant sanctioned during the past eight years, approximately 57·9% was for stations belonging to local authority undertakers; about 34·5% for stations of company undertakers; and about 7·6% for stations owned by railway and tramway authorities and non-statutory undertakings.

During the year ending March 31st, 1928, the Commissioners issued consents (9 to authorised undertakers and 6 to non-statutory undertakings) in respect of the establishment of new generating stations, representing the initial installation of plant having a total rated capacity of 246 642 kW.

During the past year, consents to the extension of existing generating stations were given by the Commissioners to 61 authorised undertakers, and in 11 further cases to railway and tramway authorities and non-statutory undertakings. A complete list of the undertakers and authorities concerned, indicating in each case the total capacity of the generating plant sanctioned, is set out in an appendix to the report. The appendix also contains a supplementary statement of consents previously recorded but subsequently amended or cancelled.

The sanctioned extensions represented, in aggregate, a plant capacity of 421 715 kW. The division of the total as between the various authorities was as follows, namely:—Local authority undertakers, 237 480 kW; company undertakers, 143 811 kW; railway and tramway authorities, 40 000 kW; and non-statutory undertakings, 424 kW.

Consents authorising the installation of 10 000 kW or more of new generating plant in existing stations were issued to 16 authorised undertakers and two railway authorities, these consents accounting for 323 000 kW or approximately 76% of the above-mentioned aggregate. In six instances sanctions were given to the installation of 25 000 kW sets.

At the commencement of the year under review, 95 applications for special orders under Section 26 of the Act of 1919, relating to the establishment or extension of distribution undertakings, etc., were under consideration by the Commissioners. During the year 80 further applications were received, and one of the applications previously made was divided by the Commissioners into two parts, thus making a total of 176 applications under consideration.

During the year, the Commissioners made special orders in respect of 81 of the applications before them, all of which orders had been submitted to the Minister of Transport for confirmation by March 31st, 1928. Of the 80 applications received during the year, 39 related to the establishment of new distribution undertakings and 36 to the extension of existing areas of supply. As in previous years, a noteworthy feature of many of the applications was the large extent of the proposed areas of supply. There was again a pronounced element of competition between applications, as many as 24 of the applications lodged during the year competing with other applications.

Special Orders Approved.

Inclusive of certain orders confirmed by the Minister during the period covered by the previous report, 70 special orders in all were submitted to and approved by Parliament during the year under review.

At the commencement of the period covered by this report, 170 applications for sanction to borrowing were under consideration by the Commissioners; and during the year under review, 768 further applications were received. Sanctions, either in full or in part, were issued by the Commissioners in 751 cases. The total amount of the loans sanctioned during the year, less certain cancellations, was £18 020 063, representing an increase of over 17% on the figure for the preceding year. The amount under "other purposes" of the loans sanctioned in 1927–28 for wiring installations for consumers' premises and for the purchase of domestic apparatus and appliances for hire or hire-purchase was £539 404, the corresponding figure for the previous year being £400 941.

Of the total sum of £102 587 184 sanctioned in the course of eight years, approximately 43% was for the provision of plant (generating plant, boilers, condensing plant, motors, converters, transformers, switchgear, etc.), about 39% for mains and services (main transmission lines, overhead lines and underground mains, services, etc.); and the remainder for a variety of other purposes (land, buildings, and other permanent works, meters, wiring, domestic apparatus, etc.), including the acquisition of established undertakings.

ELECTRICITY SUPPLY AND THE CONSUMER.

A Critical Examination of Points Raised by Dr. Lulofs—Views on the Quantity Tariff —Important Data Omitted from Commissioners' Statistics.

By J. RUTHERFORD BLAIKIE.

DR. LULOFS, Director of the Amsterdam Electricity Works, recently contributed an article to THE ELECTRICIAN on "Domestic Tariffs." This article contains many notable features in the method of analysis of costs; but unfortunately the difficulties of the translator and one or two printer's errors leave the reader in some doubt as to complete comprehension. If I have fully understood the analysis, the following principles emerge :—

1. The load factor, or number of hours used, is averaged for 120 000 consumers of the domestic dwelling class, for lighting only. With the load factor fixed, one kW of demand can be represented by a definite number of kWh sold, and therefore the capital charges can be expressed at per kWh sold. The kW demand is only recognised in the generating plant, h.t. mains, and h.t. (10 000-3 000 V) transformers.

2. The capital charges for l.t. mains, transformers (3 000-220 V) services, etc., are charged directly on the kWh sold, and not per kW demand, on the grounds that length is a much larger factor in the cost than cross section. Dr. Lulofs discusses the varying costs depending on varying lengths of consumer's frontages, but finally decides on adopting an average length per consumer. It will be observed that the deletion of this heavy charge from the usual kW demand system of analysis considerably reduces the effect of load factor, i.e., the difference in a few points in load factor makes a very small percentage difference in the estimated costs.

3. Coal, station wages, and repairs are all included in generation costs, forming the usual "running charge" per kWh. There is no "standing" coal, which again reduces the effect of load factor.

4. Management, insurance and distribution wages are charged per consumer.

Quantity Tariff for Lighting.

With this analysis, so far as lighting is concerned, it will be seen that all capital charges can be added to the generation costs at per kWh sold, and the fixed charge is made per consumer. This latter charge works out at 30·8 shillings per annum and the kWh rate as follows :—

Average hours of use per annum, 1 570.	
Capital cost per kW plant generating station per annum	£2 15 0
Capital cost per kW plant h.t. mains and transformers per annum	1 9 4
Total	£4 4 4

At per kWh sold, 1 570 hours, the aove amounts divided by 1 570.

	Per kWh sold.	
Generating station	0·421d.	
H.T. mains and transformers	0·224	0·645d.
L.T. mains and transformers	0·264	
Generation (coal, etc.)	0·330	0·594d.
		1·239d.

With these data we have a quantity tariff for lighting.

kWh per annum.			Cost per kWh.
	Standing charge, 30·8s. per annum	369·6d.	
50 at	1·239d.	61·9	
		431·5	8·63d.
	Standing charge	369·6d.	
100 at	1·239d.	123·9	
		493·5	4·935d.
	Standing charge	369·6d.	
131 at	1·239d.	162·3	
		531·9	4·06d.
	Standing charge	369·6d.	
200 at	1·239d.	247·8	
		617·4	3·087d.

It may be remarked here that the hours of use, viz., 1 570 per annum, is very high, but it should be pointed out that the number of consumers on this undertaking is greatly in excess of our experience, and that the average consumer is very much smaller.

1926.	No. of Consumers.	Max. Demand.	kW per Consumer.
Amsterdam	148 700	57 000kW	0·348
Glasgow	65 674	91 700kW	1·39
Liverpool	41 762	73 684kW	1·76
Birmingham	37 101	113 650kW	3·2
Sheffield	31 348	76 614kW	2·44

It may be that with such a very large number of small consumers that the diversity factor amongst them is much higher than our experience suggests. It is instructive to note how far British undertakings are behind in the matter of consumers.

Having got so far, it is disappointing to find that Dr. Lulofs does not further consider a quantity tariff; to quote the words of the article, he says :—

"And now we must ask ourselves whether it is right, when fixing tariffs, to treat each consumer individually, and keep the lighting price demanded in line with the costs, i.e., inversely proportional to the extent of the consumption, or to put all lighting consumers (dwelling-houses) in one group and charge each consumer the average kWh price. The latter system is usual, and, in fact, justified; it constitutes a social tariff, and other arguments (which can hardly be gone into now) support the maintenance of this as a general principle."

How is this question answered in Great Britain? All our load factor enthusiasts, disregarding the extent of the consumption, and reckoning only on the load factor, stoutly maintain that it is right to charge the individual in accordance with a load factor analysis. And probably a great number of those who have lapsed from this procedure have only done so on account of difficulties with consumers, and still base their price on the average load factor of their consumers, as ascertained from a load factor analysis. There may be in certain cases a small extra discount for quantity; but I think it may be said that this is pure guesswork, and not the result of analysis.

We will now return to the problem of other domestic supplies in Amsterdam. So far as I can gather, Dr. Lulofs suggests that the amount covering generation and l.t. mains, 0·594d., roughly 0·6d., will suffice for all extra kWh supplied to consumers who have already paid for the kWh used for lighting at the price as shown by the analysis. There is no mention of diversity factor or the coincidence of time in these supplies.

Suitable Diversity Factor.

As we argue the case in this country, there must be something for extra capital charges on generating plant and h.t. mains. By supposing a suitable diversity factor, we might make a similar amount suffice. For example, suppose we say that for each kW that appears on the station peak load, say 3 500 kWh are sold, the costs per kWh would appear as follows :—

	Per kWh sold.
Generating station (capital)..	0·187d.
H.T. mains and transformers	0·1
Generation (running coal only) say..	0·2
Leaving for l.t. transformers	0·113
	0·6d.

We might assume that the l.t. mains remained the same, the only difference to the system being additional feeding points with extra transformers. There is also a possibility that extensions in plant and h.t. mains might cost less than the average existing plant, on account of larger units.

From Dr. Lulofs's findings he proposes two forms of tariffs :—

1. All lighting kWh at about 4d. plus profit, and all heating and power kWh at 0·6d. plus profit.

2. Some fixed charge based upon the fixed charge per consumer, plus the estimated charge for generating plant and h.t. mains re-

Digitized by Google

quired for the lighting of any particular consumer, plus all kWh used at 0·6d. plus profit.

The method proposed for estimating the lighting consumption of any consumer is similar to our own "floor space" modified by the "status" of the consumer, which qualification rather suggests our "rateable value" system.

It is also stated that two rate meters allowing current at night for water storage heating at 0·396d. per kWh are proving popular.

The data in the original article is given in shillings and decimals of a shilling, which I have converted to pence, and, so far as the figures are available, the capital and generating costs compare reasonably with our own, except perhaps in l.t. mains, from which I presume that some distribution in Amsterdam is by means of overhead wires, without many restrictions for the protection of other services.

For generation, compare Amsterdam at 0·33d. with Glasgow at 0·29d., Birmingham at 0·4d., Sheffield 0·33d., and Liverpool at 0·45d.

In the fixed charge per consumer, however, British costs are generally much higher, perhaps due to a lower state of development, i.e., fewer consumers, and possibly due to considerable quantities of distribution being d.c. Nevertheless, Sheffield appears to have achieved a lower cost in this respect than Amsterdam, at 30·8 shillings per consumer.

Generally speaking, the article emphasises the importance of taking into consideration the amount of the consumption per consumer, a point that I have stressed for the last three years in other articles. Data concerning the number of consumers does not appear to be appreciated here, and is still curiously missing from the Electricity Commissioners' statistics.

From an interesting diagram in the article it is seen that the smallest consumers, to the number of 10 000 only, produce a revenue averaging about 15 shillings each, and up to 52 750 consumers the average revenue does not exceed the calculated standing charge of 30·8 shillings per annum, "so that more than a third of the consumers just bring this amount in, without paying for their current at all, let alone giving a profit."

In these circumstances, one may ask: Why go to the trouble and expense of assessing consumers for their lighting? Why not consider a quantity tariff such as was described in the issue of THE ELECTRICIAN for November 21st, 1927, which seems likely to give at least the same degree of equity, and in addition, to satisfy the ordinary man's demand for "Equal quantities of the same article at the same price."

ALIGNMENT COSTS CHART.

A Convenient Method for Effecting Rapid Comparisons.

By W. A. BARCLAY, M.A.

WHERE an electricity supply authority has alternative methods of charging for current consumed, the question is often asked: "Which of the methods is preferable in the individual case?" As an example, the following scale of charges may be cited:—

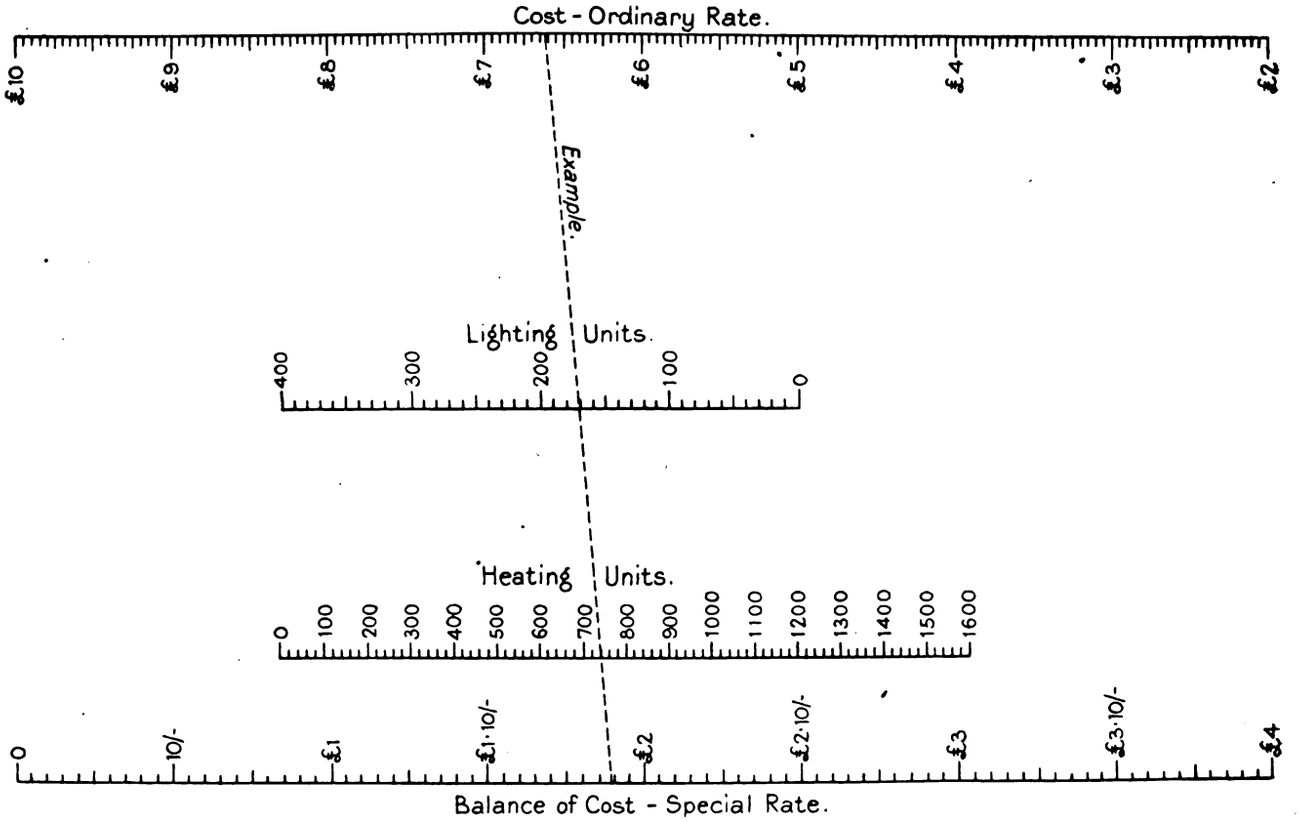
(a) *Ordinary Rate.*—5d. per unit for lighting, plus 1d. per unit for heating.

(b) *Special Rate.*—A fixed sum, plus a balance of ½d. per unit for both lighting and heating.

In order to compare the costs at these two rates, the accompanying alignment chart was prepared. The two centre scales show units of heating and lighting used. If a straight line be placed across these scales at the particular values of the units consumed, it will meet the left-hand scale at the cost at the "ordinary" rate, while it will also meet the right-hand scale at the balance of cost at the "special" rate. It will be noted that but one setting of the index line is required to obtain both these results. To the figure shown on the right-hand scale will, of course, fall to be added the fixed sum agreed on in the particular case, usually some fixed percentage of the rental.

An example of the use of the chart may be given. If 170 units are taken quarterly for light, and 740 for heating, the cost at the ordinary rate is immediately read off at £6 12s. 6d., while the balance of cost at the special rate is just under £1 18s. (*vide* dotted line on the diagram). If the fixed quarterly sum payable is, say, £4, it will be seen that the special rate, being in all £5 18s., is the more profitable for this particular consumer.

The chart thus presents in convenient form a very rapid means of comparing costs. It should be added that other scales of cost corresponding to other methods of charging might easily have been included in the same diagram. Such additional scales would, doubtless, be of interest to supply authorities as a ready means of comparing several different systems of charging for current. It was, however, thought best not to complicate the present diagram by the inclusion of such scales, though the writer will be pleased to supply them if sufficient interest warrants.



The scale, described in the accompanying notes, which has been designed to facilitate rapid comparison of costs.

WOOD-POLE STRENGTH TESTS.

Is the Rigid Formation Method Inaccurate?—The Opposing Moments of Force—Bringing Maximum Fibre Stress into Play.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

IF we are to judge from a paper recently read by Mr. Woodhouse before a meeting of the I.E.E., it would appear that we have not only been making inaccurate wood-pole line calculations, but it would also seem that wood-pole tests made on the basis of rigid foundation are inaccurate. The truth of these two statements can be gathered from the following notes, which are directly adverse to the wood-pole strength methods recommended by Mr. Woodhouse.

In the first place, it is necessary that we properly prepare the whole, so that we are assured of testing the true strength of the pole, conforming to accepted good practice—i.e., assured that the foundation is both strong and stable properly to allow of the *true strength* (the maximum internal moment) of the pole to be tested.

In a pole the lateral pull has a tendency to overturn the pole, and is resisted by the internal stress in the pole timber. There is tension on the side away from which the pole is being forced, and compression on the other side. This results in two opposing moments of force, one external and the other internal. The external moment referred to here is the force applied in lbs. multiplied by the height of this force from the ground-line; the internal moment is the timber fibre stress multiplied by the section modulus. As the two opposing moments of force are equal to one another, we can represent this condition by equating to zero

$$ph - f(\pi d^3/384) = 0$$

or

$$ph - 0{\cdot}00818fd^3 = 0$$

and for $f = 7\,800$ lbs./sq. inch, we have

$$ph - 63{\cdot}8d^3 = 0$$

where

p = transverse force applied, in lbs.; h = height of application of load above ground-line, in ft.; f = fibre stress of timber, in lbs./sq. inch.; d = diameter of pole at ground-line, in inches; $\pi = 3{\cdot}1416$; $\pi d^3/384$ = section modulus.

The accepted fibre stress value (7 800 lbs./sq. in.) *times* the section modulus (d^3 0·00818) are not necessarily the *true* figures, but the former has been accepted for this country for red fir, and the latter has been accorded universal acknowledgment for round poles. As the product of these two factors gives the maximum internal moment it is quite evident that we must introduce a factor of safety. In the opinion of the writer, assuming in the first place that the assumed fibre stress value is reasonable, we are safe in working to a factor of safety of 2·5; the said factor of safety taking the form

$$F = \frac{M'}{M''} = \frac{\text{maximum internal moment}}{\text{external moment}}$$

This maximum internal moment is developed when the timber is stressed to its maximum fibre stress.

It is important to note that, for a given transverse force per pole and span, the factor of safety will vary: (*a*) . . . directly as the span length; (*b*) . . . inversely as the wind load; and (*c*) . . . directly with the fibre stress of the timber. Thus we may readily arrive at a fundamental basis to discuss the best possible changes in regulation loading conditions.

Internal Moment of Timber.

We must keep in mind that pole foundation is distinct from pole timber strength. The real strength should be (and is always) calculated on the maximum internal moment of the pole timber. And it is no more than plain common reason to expect the other strengths upon which the *pole* strength depends, such as the foundation, to be at least as strong as the pole itself. Hence, we start with the pole timber not with the foundation, and, in making tests for a pole, we must test the true pole-strength and have the foundation more than strong enough to give the *true strength* of the pole timber—i.e., produce the maximum internal moment with the above ground part of pole set according to accepted good practice for the conditions to be met, just as in actual practice. The true tests depend entirely on the internal moment referred to here, and can be obtained only by having a foundation strength and stability at the very least sufficient to take care of the true maximum permissible external moment of the pole when *self*-supported.

Taking a 10·0 inch diameter red fir creosoted pole at ground-line, the maximum internal moment is

$$M = 63{\cdot}8d^3 = 63{\cdot}8 \times 10^3 = 63\,800 \text{ ft. lbs.}$$

The fibre stress value for this moment is taken at 7 800 lbs./sq. inch. In practice, however, the external moment must always be somewhat below this figure. For this country, at the present time it is 3·5 times *less* which gives us an allowable external moment of only 18 230 lbs./sq. in., equivalent to the actual transverse force on the pole and span in lbs. times the height of its application above ground-line in feet, or the maximum permissible external moment for a *self*-supported pole. But, staying this pole, which is sounder and more economical, will permit the safe use of a factor of safety of 2·0 or less, or the equivalent conditions put in another way.

This wooden frame was felled, trimmed and erected in a fresh green state over 20 years a go, and is still standing. The beam formula calculation for the poles (legs) was used in those days and found to be as reliable then as now. The writer was held directly responsible for the operation of the entire 60 000V hydro-electric system.

We therefore see that for every case the maximum internal moment of the timber cannot be reached, for the simple reason that calculations are made for lateral pull which limits us to a force something like 3·5 times *less* than the "supposed strength" of the timber used, assuming the value 7 800 for fibre stress to be accurate.

No matter whether the support be of wood, steel or reinforced concrete (single or compound), or a steel or wooden structure or frame, the foundation must be strong and rigid enough to allow of the full (true and effective) maximum fibre stress of the timber to come into play when under test conditions arranged to conform to accepted good practice where such a character of loading is expected to occur. Obviously, a building may crack or collapse due to a movement of its foundations, but we cannot justly say the building is weak—exactly so with the pole, and, as an advantage over a building, we can stay the pole, and in this way assist the foundation strength for a given lateral pull, or we may increase the lateral pull (the external moment) for the same foundation strength. Hence, we are justified in lowering the factor of safety when using stays, which again brings up the proposed value of 2·5 as against a very detrimental value for factor of safety if we accept the test figures which are given by Mr. Woodhouse.

The writer's views are therefore diametrically opposite to those of Mr. Woodhouse, which condition indicates grave error somewhere.

It seems evident from the said paper referred to above that Mr. Woodhouse recommends and/or believes in testing (or in the strength of) an unsupported wood pole so that its strength is approximately *one-fifth* (1/5th) that of the same pole tested with immovable foundation (such as the Wade test of 1907), or tested so that neither the maximum nor the truly allowable external moment can be attained.

On the other hand, the writer believes in testing an unsupported pole so that its strength is approximately *five* times that of the same pole tested according to Mr. Woodhouse, and also, in testing a supported pole installed according to good practice, to have a strength more than *five* times that of the same pole tested according to Mr. Woodhouse.

IRONCLAD SWITCHGEAR.

Some Advantages of the Vertical Draw-Out Type—Characteristics of Equipments for Low and Medium Pressures—Savings in Space.

SWITCHGEAR of the draw-out type has become a recognised standard for ironclad switchgear. Almost all the leading switchgear makers have their standard range of this gear, but it was not until recently that the vertical draw-out, came into its own, though at least one maker of oil switchgear had a range of this vertical type in pre-war days.

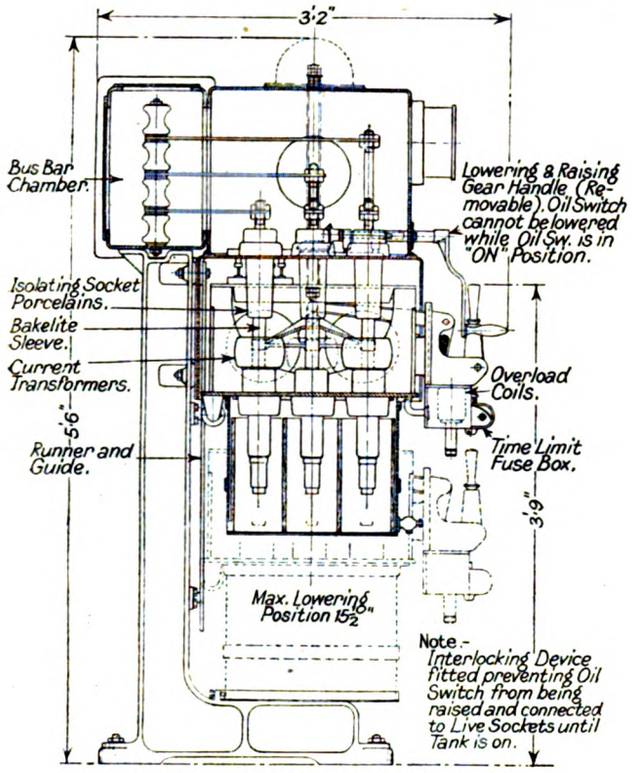

Fig. 1.—Side view of unit showing overall dimensions.

In Fig. 2 we illustrate a range of industrial units recently installed in a rubber works by J. G. Statter and Co. The total capacity of the board is 1 500 kW. The voltage is 416, and the current capacity of the units, of which there are fifteen, ranges from 300 to 750 A.

One advantage claimed for the equipment is saving in floor space. The unit requires no more floor space when open for inspection, and therein scores over the horizontal draw-out. The makers claim other advantages, but let us consider the "space claim" in relation to the example illustrated. The pitch of the units, measured centre to centre, and including the space allowed for cable dividing boxes between each, is 2 ft., and the total depth, back to front, is 3 ft. 2 in. It must be admitted that this shows economy in floor space for units carrying 750 A and requiring no more space when opened up.

Another practical advantage claimed is that the handling of the tank is all accomplished by the raising and lowering gear, the one gear serving both for inserting and withdrawing the plugs, and also lifting and lowering the tank. The latter is lowered into a kind of "dock."

If it is not required to take the tank away, it remains in its "dock" whilst the switch is wound up out of the oil to a position clear of the tank where it may be operated, inspected, adjusted, and even have new spark tips fitted. It cannot be plugged on to the busbars until it has been lowered into the tank, the tank refixed and the switch opened. Then, and then only, can the switch be plugged on to the busbars.

To go back to the point at which the switch had been drawn out of the tank while the latter rested in "dock," the runners upon which the tank bottom rests are 6 in. above the floor level. If it is desired to take the tank away, a Slingsby trolley can be pushed between the pedestals of the unit and underneath the tank. It is then only necessary to raise the deck, and the tank can be wheeled away.

Fig. 1 shows a side elevation of a unit, partly in section. It will be seen that the oil switch stems enclosed in massive porcelain insulators pass through the switch plate into the mid chamber. They are then shrouded in bakelite tubes, leaving only the plug ends bare. These are shrouded in deep porcelain insulators, which enclose them completely until they are withdrawn from their sockets and made dead.

Current transformers of the straight-through type, with porcelain centre bushes, are slipped over the bakelite shroudings and fixed in that position.

In the middle chamber all the live parts are completely shrouded in insulating material; and no exposed live conductors are permitted, except in the top chamber which is protected from the switch tank by two cast-iron plates. The exposed conductors are guarded from any explosive action which may take place in the switch tank, and where exposed conductors occur full B.E.S.A. clearances are provided for.

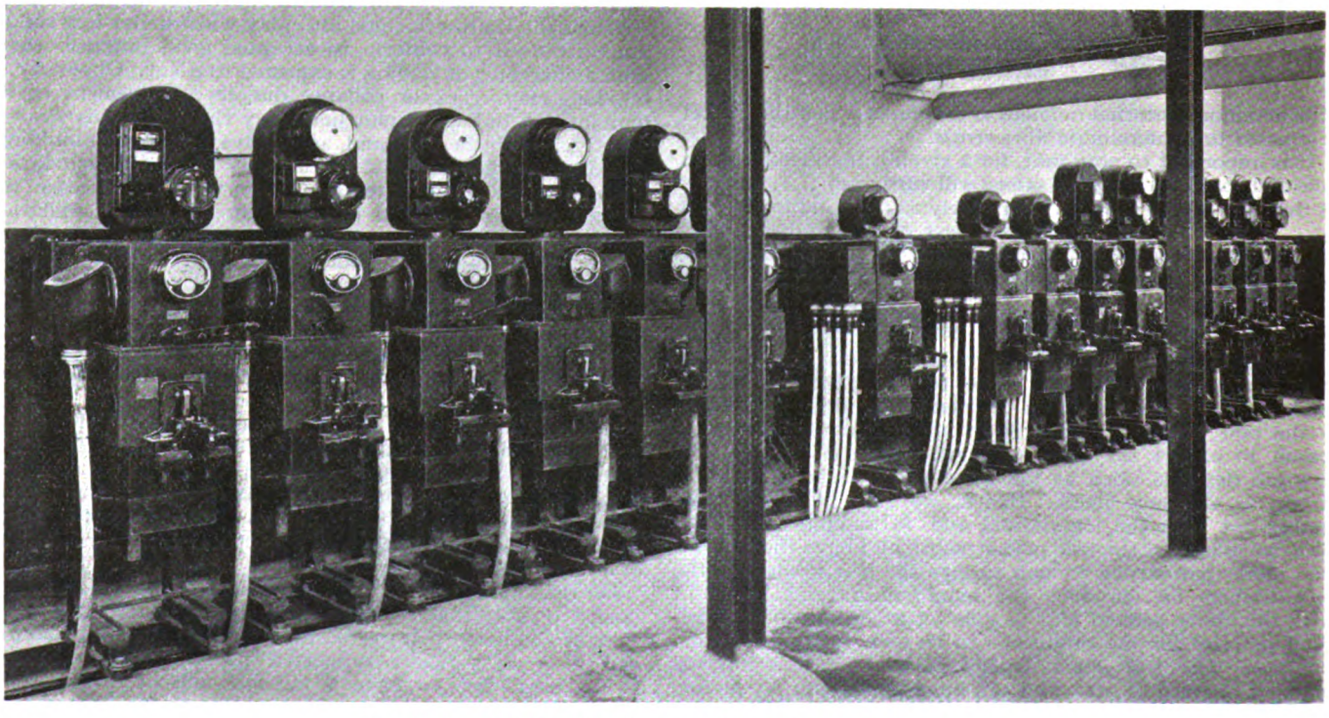

Fig. 2.—A bank of 15 vertical draw-out units installed in a rubber works.

MARINE ELECTRICITY.

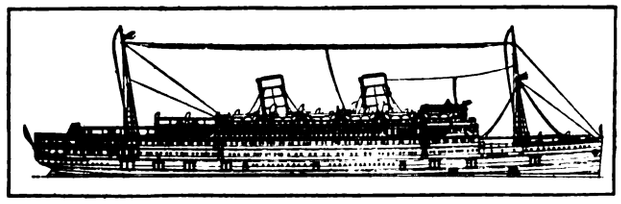
Further Thoughts on the Fitting of Electric Propulsion to the Largest and Fastest Ships Exemplified by a 100 000 H.P. Layout—Compactness of Arrangement Secured by Horizontal Drive to the Generator Sets.

By A. C. HARDY, B.Sc., A.M.I.M.E. (Author of "Motor Shipping," "Merchant Ship Types," etc.)

SHIPOWNERS are interested in electricity for propulsion purposes because they can see certain advantages to the passenger from the comfort point of view as well as, on the largest ships, a very real and helpful solution to the problem of how to handle their ever increasing auxiliary loads. As far as the largest and biggest ships are concerned, the builder of marine internal combustion engines is beginning to think about electric propulsion because he sees in marine electricity his best possible approach to the highest of powers (100 000 H.P. and over) and the fastest of mercantile speeds (21 knots and over). And in truth he has a very good selling point because he can offer the shipowner the superlative economies of the Diesel engine for ships to which they would not otherwise be applicable.

If we want to discriminate between Diesel-electric and turbo-electric propulsion for large passenger ships, we may definitely say that at the present time there is no definite swing of the pendulum in either direction. It is currently reported that the new White Star liner of over 100 000 H.P. will be a Diesel-electric ship, whereas a new Cunard mammoth which unquestionably must be laid down before long will, according to many accounts, be turbo-electric. The "Viceroy of India" is going to show to European shipping what the all-electric ship is capable of from a propulsive performance view-point, just as the big I.M.M. Atlantic-Pacific liners showed American shipping men—apparently with good effect—what American marine electricity was capable of producing. I say "with good effect" advisedly, because of the recent very important contract which has been placed with the Newport News shipyard by the Ward Line for New York-Havana service. Comment on this ship was made in my last article.

Apropos of high-power installations, however, it may be regarded as of some importance that a well-known firm of marine Diesel engine builders has just published plans for a Diesel-electric passenger liner of 100 000 H.P. This will show an interest in marine electricity on the part of firms in the marine prime mover industry. The firm in question is the Doxford Company of Sunderland, and their lay-out is reproduced herewith. It comprises, as will be seen, sixteen two-cycle opposed piston six-cylinder Doxford heavy oil-engines, arranged in groups and coupled to 4 300 kW generators. The engines have a cylinder diameter of 24 in., and a combined stroke of 72 in. and operate normally at 150 r.p.m. The engines are of airless injection type, and hence need no injection air compressors. Being of two-cycle type they need scavenge arrangements, but these are of separately driven rotary type arranged on flats in the two auxiliary engine-rooms between each pair of main engine rooms. These auxiliary engine rooms are of two deck arrangement, the space at tank top presumably being used for pumps and other auxiliary machinery. Five generator sets are arranged in the forward engine room, six in the centre engine room,



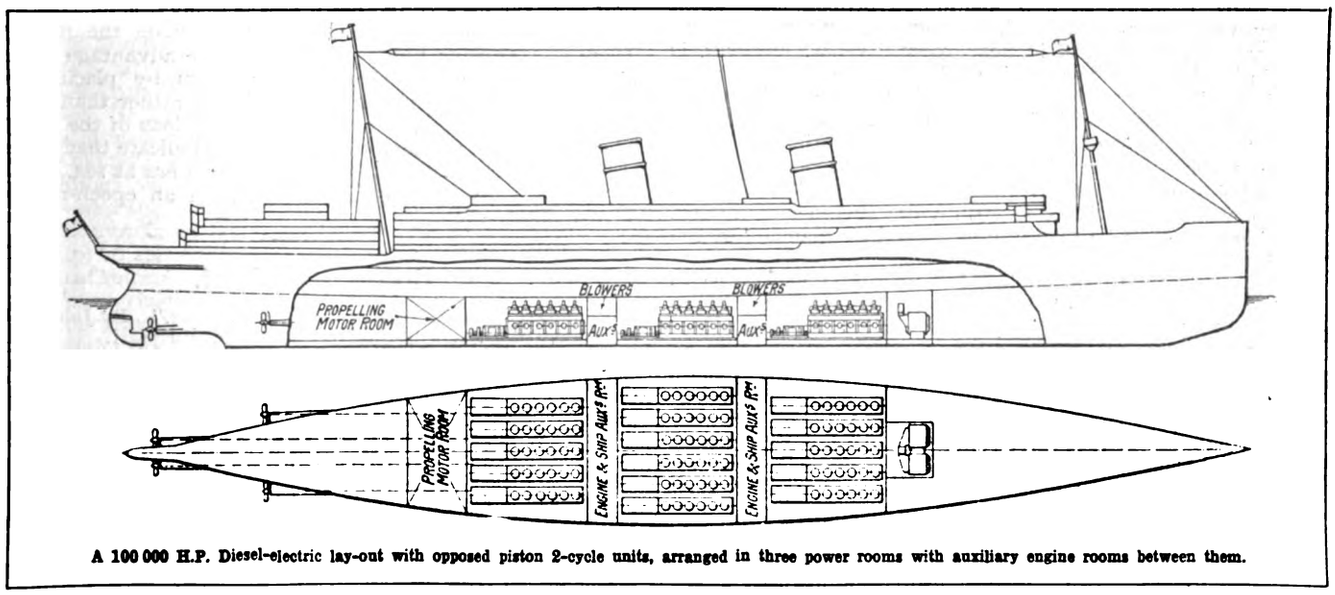
One of the two 16 000 H.P. turbo-electric liners building in America for New York-Havana service as she will appear when completed in December 1930. These vessels serve as an indication of the rapid strides which have recently been made in marine electricity.

and five in the aft engine room. A large propelling motor room is abaft the after engine room. The total shaft horse-power is arranged on four shafts, but we are not told how many motors are arranged on each shaft.

The particulars furnished are somewhat sketchy, but they are at any rate sufficient to show that the total space taken up is not excessive, certainly no greater than that absorbed by a corresponding boiler and turbine arrangement of the days before electric propulsion came into its own. At a guess, too, I should say that it would not be greater than that taken up by a turbo-electric plant with boilers. The lay-out is entirely hypothetical, but is important as indicating that large scale high power electric propulsion is definitely coming into prominence. It is unquestionable that with this arrangement there would have to be more than one motor per shaft. This is inevitable with a very large electrical ship. If conjectures *re* the powering of the new White Star liner are correct, each shaft (of four) will have no less than six motors per shaft—each of about 7 500 H.P. This is purely a matter for arrangement and convenience, although naturally there is an upper limit per motor as regards size. In some comparatively small electric vessels, such as New York harbour ferries and tugs, the power is split up between two motors.

On the "Viceroy of India" there are two propeller shafts, each driven by a single 8 500 H.P., 3 150 V motor, turning at 109 r.p.m. It is interesting to contrast the propulsion arrangement of this ship with that of the new American Ward liners, one of which is illustrated in profile herewith. Unfortunately similar detailed information on the new Grace electric liners has not yet been generally released. The table on the next page contrasts their characteristics in tabular form.

Both the new Ward liners and the "Viceroy of India" are



A 100 000 H.P. Diesel-electric lay-out with opposed piston 2-cycle units, arranged in three power rooms with auxiliary engine rooms between them.

Digitized by Google

examples of fast up-to-date passenger carriers, and the two former vessels will be among the most luxurious ships running out of New York. They will have a displacement of 15 830 tons on a mean draft of 26 ft., and will carry some 6 840 tons of cargo, for the handling of which there will be fourteen electric winches, each driven by a 25 H.P. motor. The anchor windlass s driven by a 75 H.P. electric motor, and there are also two electric capstans. Two steam turbines of 8 000 H.P. each are direct-coupled to two a.c. generators of 6 100 kW each, which supply current to two 8 000 S.H.P. propelling motors. These, presumably, are arranged in the main engine-room as in the " California " and as in the " Viceroy of India."

RECENT FAST ELECTRIC SHIPS CONTRASTED.

	" Viceroy of India "	Ward Liner.
Dimensions	612 × 78 × 82	482 × 70·75 × 39
Speed	19	20
Screws	2	0
Tonnage	19 700	11 300
Power..	17 000 S.H.P.	16 000 S.H.P.
Turbo-alternators ..	9 000 kW	6 100 kW
Boilers	6 Yarrow	6 B. and W.
Pressure	350 lb./sq. in.	300 lb./ sq. in.

It is a somewhat interesting development that one of the earliest talking points in favour of electric propulsion was that considerable gain in space for cargo could be accomplished, because the motors could be arranged right in the stern of the ship on a short shaft. As a matter of fact, the gain in space was not appreciable, whereas the inconvenience that the engineers found in having to go up on deck, walk aft, and descend again into the motor room was considerable. The " Viceroy of India " and most electric ships now building have full-sized shaft tunnels. The Diesel-electric fruit-carrying ship " La Playa," was the last ship in which this arrangement was adopted. In order to get to the propelling motor, one had to walk aft into the poop and to descend via some very narrow uncomfortable steel ladders into a none too roomy " V " shaped compartment where the propelling motor was situated.

The Most Compact Electric Arrangement.

Actually one of the most compact Diesel electric lay-outs in small ships and, if the power can be achieved, in large ships, is by means of a horizontal Diesel engine drive to the generators. So unusual is this idea that, if carried to its logical conclusion on certain ships, it bids fair to usher in a new era in ship construction because of the novelty in deck arrangement which it permits. It has been postulated, and is now generally accepted, that electric propulsion is applicable either to ships of very high power or to ships of high auxiliary requirements, such as insulated fruit and meat ships. These ships have three and four tiers of 'tween decks, and in fruit ships especially these 'tween deck spaces are made as long and continuous as structural strength considerations will permit. These 'tween deck spaces, except perhaps the top-most space, are only continuous on either side of the machinery space vertical bulkheads. The higher the prime movers driving the generators the more (vertical) space taken up by machinery space. A turbo-generating set is very compact and economical in head room. What, however, is gain in headroom by the turbine is lost by the boiler uptakes, and the boilers themselves. The vertical Diesel engine is apt to be somewhat greedy in head room also. So that if one is out for compactness of machinery space, the horizontal Diesel prime mover has everything in its favour, and permits, other things being equal, possibly two further tiers of 'tween decks being continuous all fore and aft. What this means in extra carrying space can be readily appreciated by glancing at the profile of any refrigerated ship.

The horizontal Diesel engine, however, is a newcomer to marine work and hence is being regarded somewhat askance by the shipping world. Actually it made its first appearance as a direct drive prime mover for the refrigerating plant on some large motor liners built for the Nelson Line, and these first units were built by the Premier Gas Engine Co. of Nottingham. From this beginning has gradually been evolved the idea of applying them to drive generators. A lay-out has been prepared which is of no little interest. Four 8-cylinder, 4-cycle *vis-a-vis* Diesel engines, each developing 1 000 H.P., are coupled to a generator and exciter, and supply current to a propelling motor. The idea is only schematic, but capable of considerable development.

A similar but somewhat smaller installation fits very nicely into a Diesel-electric ship of " La Playa " type. This ship is 325·2 ft. by 48·1 ft. by 28·3 ft. moulded dimensions, and as completed she had four 825 B.H.P. Diesel generator sets running at 250 r.p.m. The main Diesels in height rise to the first tier of 'tween decks. None of the 'tween decks are continuous all fore and aft. An arrangement with horizontally-driven generator sets would permit of four 800 H.P., 4-cycle engines each driving generators at 225 r.p.m. and delivering the same power to the shaft as with the existing sets. The length of engine space would be 60 ft., the width would be the width at tank top space, and the minimum head room above tank tops would be 10 ft. Thus, in effect, it would then be possible to make all three insulated tiers of 'tween decks continuous all fore and aft with a corresponding increase in carrying space which can be easily calculated, allowing only for a small narrow trunkway running up to the top deck for access and ventilation. . . . The possibilities of marine electricity in association with this form of drive are great but the problems associated therewith are those of prime mover construction rather than of electrical arrangement.

The Flexibility of Marine Electricity.

Electricity is conspicuous by the compactness with which it can be generated and the ease with which it can be led from place to place and tapped as required. No electrician needs to be told this, but it is a truth which is far from generally recognised in the marine world. A case has recently occurred at sea which proves very definitely that had electricity been used no delay need have taken place. A Liverpool-Isle of Man packet was homeward bound in the recent severely cold weather when her steering gear jammed and went out of action, presumably due to the fact that the oil in parts of the telemotor system literally froze. Several hours' delay was occasioned by the engineers having to dismantle part of the gear. An all-electric gear would continue in operation irrespective of the state of the weather. From a switchgear point of view an all-electric steering gear has received from marine men the reputation of complicatedness, but in a well-equipped ship there should be no difficulties whatever. An increasing number of vessels are going to sea fitted with this type, and with each ship there is an increase in confidence for this type compared with the electro-hydraulic type.

There are many advantages which the electric motor of to-day has compared with the steam engine—for auxiliary work. Mr. G. J. Scott touched on some important points in a recent paper which he read before the Institute of Marine Engineers, dealing with the design of marine auxiliaries. One of the chief advantages he touched on was the extremely large overload capacity of the d.c. electric motor for short periods, which qualification for capstans, winches, and windlasses is invaluable. The electric motor is always ready to run at full load and even overload at a few seconds notice: the steam engine only if steam is kept in the feed pipes. The paper is full of interesting information and well repays study.

The increase in the number of electric winches and electric deck auxiliaries during the past few years has been enormous, and the flourishing and yet, perhaps, embryonic state of this branch of the industry is shown by the many different designs and arrangements of deck auxiliaries now on the market. There is a growing tendency, too, to take advantage of the flexibility which marine electricity offers by placing the controls for winches in strategic positions rather than fixing them down to one place by physical conditions of the winch. These and other matters would appear to indicate that we are still only at the beginning of the electrical era at sea. That is why the " Viceroy of India " is such an epoch-making development.

THE BRITISH INDUSTRIES FAIR.

A Brief Review of Some of the Electrical and Radio Exhibits at the White City Section of the Fair—Extensive Range of Measuring Instruments.

THE London section of the British Industries Fair draws to a close to-day, Friday, simultaneously with the Birmingham section, and though the bulk of the heavy electrical exhibits were to be seen at Castle Bromwich, there were nevertheless many items of electrical interest in London.

In order that overseas readers may have a complete record of the Fair we follow our last week's description of the Birmingham section with a brief review of the electrical exhibits in London. Many of the exhibitors in this latter section were wireless manufacturers and some of these only showed apparatus which has been previously described in connection with the last National Radio Exhibition, where such is the case the items have been omitted, as have also many of those electrical exhibits which have been dealt with in previous issues.

J. G. INGRAM AND SON (Hackney Wick, London, E.9). The exhibits on this stand comprised rubber gloves and gauntlets for the electrical industry certified as having withstood tests up to 10 000 V. This firm also undertakes the covering with rubber of box spanners and other tools used in electrical engineering.

MESSRS. ERNEST TURNER (Chiltern Works, 55/73, Totteridge Avenue, High Wycombe, Bucks.) This exhibit consisted of a comprehensive range of electrical measuring instruments from 2 in. diameter to 7½ in. diameter, together with portable and laboratory apparatus. It included thermo-couple instruments with internal and external couples, vacuum thermo-couples, voltmeters incorporating Westinghouse rectifiers, etc.

THOMAS DE LA RUE AND CO., LTD., (190, Shernhall Street, London, E.17). Here was shown a comprehensive display of bakelite, fireproof and plastic mouldings. The importance of the exhibit was demonstrated in the moulding-in of numerous metal parts.

GALSWORTHY, LTD. (16, Newman Street, London, W.1). The main features here were table and floor standard shades, including several models in two new materials, one of which was a reproduction of calf skin vellum. The registered name for this is "Vellumac," and it is claimed to be cheaper than vellum, while heat or damp do not affect it.

THE SHOREDITCH WOOD TURNING CO., LTD. (147, Hackney Road, London, E.2), showed Chinese lacquered wood floor and table standards and shades.

THE EVER READY CO. (GREAT BRITAIN), LTD. (Hercules Place, London, N.7). Apart from the display of hand lamps, torches, etc., shown in the Hardware Section at Birmingham, this firm devoted considerable space in the London section to wireless batteries of every type, both secondary and primary, together with a range of measuring instruments.

THE ACCURATE RECORDING INSTRUMENT CO., LTD. (Manor Road, Teddington). Here were shown steam, vacuum, etc., pressure gauges, thermometers, pyrometers and similar recorders.

Electrical Advertising Signs.

THE "ATTRACTA" ELECTRICAL CO. (2 and 3, Titchfield Street, London, W.1). The exhibits here were made up of electrical advertising signs and spectacular lighting effects.

BAIRD AND TATLOCK (LONDON), LTD., (14-15, Cross Street, London, E.C.1) exhibited a wide range of electrical and physical instruments.

BAKELITE, LTD. (68, Victoria Street, London, S.W.1). Mouldings and moulding powders, with samples of various types were the main attraction, together with demonstrations.

I. CALVETE, LTD. (11, Little Saint Andrew Street, London, W.C.2.) displayed "Thermical" diathermy apparatus for medical and surgical diathermy, Dr. Hofmanen closed arc lamps for ultra-violet radiation, the "Swift-Icall" hair-dryer, incorporating luminous heat and low-pressure air, in a specially designed helmet, as well as standard lines of "Solart" arc lamps, "Icalite" luminous heat ray lamps, switchboards for galvanic and faradic currents, and for electrolysis and cautery treatments, electric vibratory massage apparatus, hot air douches, high frequency machines, permanent hair waving apparatus, etc.

GOODWORKS, LTD. (Retreat Place, Homerton) claim to be the originators and believe themselves to be the only manufacturers of electric table standards and candlesticks which embody real elephant ivory, and their exhibit showed their products.

BOWER ELECTRIC (1926), LTD. (27, Ridinghouse Street, London, N.1) exhibited Neon tubes, and Neon tube advertising signs, including the patented "Neosyne."

THE FULLER ACCUMULATOR CO. (1926), LTD. (Woodland Works, Chadwell Heath, London, E.) showed a full range of all types of accumulators, including a series of unspillable types.

A new a.c. microammeter with readings up to 750 mA, by Ferranti, Ltd.

BERRY'S ELECTRIC, LTD. (85-86, Newman Street, London, W.1). This exhibit was similar to that at Birmingham, comprising domestic equipment, ironclad switchgear and "Berrylite" signs.

BIRKBY'S, LTD. (Liversedge, Yorks). This stand was almost a duplicate of that at Birmingham and featured "Elo" synthetic resin mouldings.

JOSEPH BOURNE AND SON, LTD. (Denby Pottery, near Derby). Among the exhibits shown by this firm were electrical insulators and battery jars.

BUROVOX, LTD. (Craven House, 121, Kingsway, London, W.C.2). Loud-speaking telephones for all purposes were shown in a variety of types.

H. CLARKE AND CO. (MANCHESTER), LTD. (Atlas Works, Old Trafford, Manchester). The exhibits here included pure mica tubes, micanite, "Atlas" varnished cloth, adhesive tapes, micafolium, vulcanised fibre, Egyptian and Indian cotton tapes, presspahn, leatheroid and pirtoid, "Atlas" coils, centre-tapped, double-tapped and short-wave, battery eliminators, a.c. and d.c., and a variety of windings of interest to the electrical industry. This latter interest has been extended to work outside radio requirements.

THE DOWSING RADIANT HEAT CO., LTD. (91-3, Baker Street, London, W.1). The firm showed a wide range of electrical domestic appliances including heaters, cookers, radiators, irons, etc.

HAILWOOD AND ACKROYD, LTD. (Beacon Works, Morley, Leeds). This stand, as at Birmingham, was used for the display of lighting fittings in glass, and miners' lamps.

IDEAL HOME ELECTRICAL APPLIANCES, LTD. (45, Great Ormond Street, London, W.C.1.) The features on this stand were mainly "artificial sunlight" apparatus, violet ray equipment, hair dryers, etc.

INDURITE (Byron House, 7, St. James's Street, London, S.W.). Moulding powders of interest to the electrical industry formed the chief exhibit.

JOHNSON, MATTHEY AND CO., LTD. (78-81, Hatton Garden, London, E.C.1). This company specialises in precious metals and a number of contacts, screws, etc., of interest to electrical and radio manufacturers were displayed.

THE M.L. MAGNETO SYNDICATE, LTD. (West Orchard, Coventry). Rotary transformers and motor generator sets for anode and filament supply to power amplifiers for radio,

Digitized by Google

public address, etc., were the chief exhibits, while mouldings and moulding powders were also included.

GEORGE NOBBS, LTD. (87-89, Cleveland Street, London, W.1). The exhibits here included thermostats, water heaters, hot plates, electrically-heated incubators, furnaces, etc.

SUNVILITE, LTD. (Fitzroy Chambers, 5-8, Whitfield Place, Tottenham Court Road, London, W.1). The exhibits on this stand were devoted to ultra-violet ray and infra-red equipment for medical and home use.

One of the portable receivers shown by Whittingham, Smith & Co.

E. K. COLE, LTD. (Ekco Works, London Road, Leigh-on-Sea) showed a wide range of mains-operated devices for use in radio reception.

SELECTORS, LTD. (1, Dover Street, London, W1.). The item of chief interest here was a short wave three-valve set with a wavelength range of from 15 to 100 metres. Other sets shown were of the portable type.

ERIC J. LEVER (TRIX), LTD. (8/9, Clerkenwell Green, London, E.C.1) exhibited a portable 5-valve equipment which may, if desired, be operated from the mains, the connection being made by a plug and socket device which automatically cuts out the h.t. battery within the cabinet.

THE NEOPHONE RADIO MANUFACTURING CO. (9/10, Little St. Andrews Street, St. Martin's Lane, W.C.2) showed a cone loud speaker diaphragm of vulcanite moulded on fabric. This, it is claimed, is durable and non-hydroscopic.

THE BROWNIE WIRELESS CO. OF GREAT BRITAIN, LTD. (Nelson Street Works, Mornington Crescent, London, N.W.1). Apart from the already well-known range of "Brownie" products, there was also shown a range of "Dominion" receivers.

A. C. COSSOR, LTD. (Cossor House, Highbury Grove, London, N.5) had on view the "Melody Maker" receiver, valves, transformers, a.c. mains units, trickle chargers, frame aerials, motor lamps, medical lamps, etc.

THE DUBILIER CONDENSER CO. (1925), LTD. (Ducon Works, Victoria Road, London, W.3) exhibited a complete range of electrical condensers, including types for use in radio transmitters, receivers, wired wireless and other apparatus, and condensers for the improvement of power factor, for line protection, for laboratory use, etc. Condensers of the dry electrolytic type were also shown. A variety of wireless components were exhibited, of particular interest being the "Toroids." The "Westminster" screen grid portable radio-gramophone was shown, together with voltage regulators, rheostats, diode voltmeters, wavemeters, etc.

THE ORMOND ENGINEERING CO., LTD (199/205, Pentonville Road, London, N.1). This stand was devoted to the display of radio components and sets of every type, including parts.

J. DYSON AND CO., LTD. (2, Coleman Street, London, E.C.2) exhibited "Godwinex" 5-valve portable receivers, battery eliminators for a.c. and d.c. mains, "Airmax" coils, 6-pin and 2-pin types, microtune variable condensers, and a new model 5-valve oak cabinet portable set.

THE WATMEL WIRELESS CO., LTD. (Imperial Works, High Street, Edgware). The exhibits of this company included complete wireless receivers of the cabinet and table types, together with a comprehensive range of components.

TRUPHONIC, LTD. (121/123, Rosebery Avenue, London, E.C.1) exhibited a 5-valve "Meloset" receiver, together with a 4-valve screen grid model complete with turntable, both sets being portable.

THE LOEWE RADIO CO., LTD. (4, Fountayne Road, Tottenham, London, N.14. Two interesting exhibits here were the local receiver type OE 333, which embodies the new multiple valve and a cone loud speaker finished in mahogany with an artistically designed silk front. A larger cone speaker suitable for use in public buildings is also manufactured.

"M.P.A." WIRELESS, LTD. (62, Conduit Street, London, W.1) displayed a range of products varying from the "Ethatrope," a mains driven, valve-amplified gramophone, to the "Plaque" speaker.

AUXEL TIME SWITCHES, LTD. (45E, The Mall, Ealing, London, W.5). Here were shown radio programme selectors, 6-valve self-contained receivers and loud speakers.

CELIBRITONE, LTD. (Commerce House, 72, Oxford Street, London, W.1). Electrical gramophone reproducing machines in three models, and combined radio and gramophone instruments were presented in a variety of styles of cabinet work. Wireless sets including 5-valve portables, public address systems, amplifiers, loud speakers, electrical pick-ups, microphones and eliminators completed the exhibit.

MESSRS. C. CRESWICK ATKINSON (356, High Street, Bedford) displayed a range of "Reliance" wireless receiver models.

THE MULLARD WIRELESS SERVICE CO., LTD. (Mullard House, Denmark Street, London, W.C.2), as in previous years, again exhibited a full range of P.M. valves, transmitting, modulating and rectifying, "Pure Music" speakers, "Permacore" transformers, etc.

THE FORMO CO. (ARTHUR PREEN AND CO., LTD.), of Crown Works, Cricklewood Lane, London, N.W.2, exhibited a comprehensive range of components and constructor sets.

BELLING AND LEE, LTD. (Queensway Works, Ponders End). This firm's well-known indicating terminals were shown, together with a new counter-display device to simplify stocking and displaying the terminals by dealers.

WHITTINGHAM, SMITH AND CO. (110, Kew Green, London), exhibited "Portadyne" model "H" receivers in walnut cases and "Portadyne Juniors." The latter are available in lizard and blue fabric finish.

THE IGRANIC ELECTRIC CO., LTD. (149, Queen Victoria Street, London, E.C.4), The wide range of components, sets, radio-gramophone equipments, etc., which were shown at the National Radio Exhibition, were again featured at the Fair. Short wave receivers were given prominence, and those employing h.f. amplification are available with wavelength ranges as low as 10 metres. "Igranikit" constructor outfits were shown in both battery and main designs. Gramophone electrical reproducing apparatus was shown in great variety, many of the models being suitable for use in public halls, cinemas, etc. Battery eliminators, transverse current microphones, and general radio components completed a very comprehensive exhibit.

Meter Equipment.

FERRANTI, LTD. (Hollinwood, Lancs). Apart from h.t. supply equipment for mains operation, the well-known valve-tester and multi-range d.c. testing set, this firm showed a centre-zero microammeter with ranges of 250/0/250 mA. This instrument is of use for works testing where the greater accuracy of the reflector-galvo is not necessary, but where rapidity of working is essential. The instrument is suitably mounted on a pedestal base and is provided with two pin jacks. Another interesting instrument by this firm is also for measuring a.c. in micro-amperes, and the makers point out that whilst there was initially no call for such an instrument numerous uses have already been found, the most important being for telephone measurements, both by actual telephone engineers and for associated work such as electrical gramophone reproduction. It is being applied by chemists to a.c. electrolytic bridge work while for general electrical laboratory work it becomes nearly as useful to the research worker or experimenter as is the moving-coil galvanometer on d.c. work. The instrument consists of a standard moving coil movement of either 2½ in., 3¼ in. or 4 in. dial size, fitted with a Westinghouse copper-oxide rectifier, suitably compensated to have a negligible temperature error. The range is to 750 mA, and the scale is said to be nearly linear from about 50 mA upwards. The voltage drop is low for the range, and is about 0·25 V at full scale reflection. Its impedance is not constant for different frequencies, and further, the impedance decreases as the current increases. The useful frequency range is from 20-4 000 cycles, serving therefore the double purpose of being suitable for all power frequencies as well as telephonic frequencies; its error does not exceed 2% at 4 000 cycles compared with the calibration at 50 cycles.

ELECTRICAL SALESMANSHIP.

Morals to be Drawn from the Prince's Speech—Why not Cultivate the Home Market?—Examples of Inefficient Salesmanship—Importance of Thriving Home Trade.

By "SALES MANAGER."

HIS Royal Highness the Prince of Wales has every reason to be satisfied with the results of his important speech at the Mansion House on the occasion of the banquet held to mark the opening of the British Industries Fair. He desired to concentrate attention on our selling methods and he has certainly succeeded in doing so.

That his criticism of British selling methods overseas was largely justified is common ground amongst those who have travelled; and the fact that we have retained so large a volume of our export trade in the face of growing competition is a sign that our goods are right and our customers loyal. But even our pre-war figure will not permit a real measure of prosperity to be enjoyed by this post-war generation.

It cannot be emphasised too strongly that the Prince was not only looking at the markets of the world. There has been a general tendency in the Press and elsewhere to assume that our salesmanship only needs improving for the increase of overseas trade. Various daily papers have published a symposia of opinions on the royal speech, but these all overlook the weakness of salesmanship in many directions in the home market.

Let us look at some of the more important lines of imports. Take one line in the electrical trade—the electrically-driven suction cleaner. The homes of this country are full of American-built sweepers. In the gas industry, a considerable proportion of the domestic fittings are of German origin and in the electrical industry no small percentage of the smaller lines are imported.

Go where you will, into whatever industry you like, and you will find that the salesmanship put behind these foreign manufactures has more than a little to do with their success.

In this connection one of our ablest thinkers has made an interesting point. "Why not," he asks, "develop to its full capacity the home market? It is no unusual sight to see a manufacturer moving heaven and earth to get business overseas, whilst in a radius of fifty miles from his factory gates there is a highly receptive market almost untouched."

We have been an exporting nation ever since the industrial revolution began to make its effect felt, and the glamour of world-wide distribution has tended to obscure our realisation of the immensity of our home market of some 45 000 000 people, each with many needs to be met and desires to be fulfilled.

The case for the cultivation of the home market in the electrical industry can be made out with no great effort. It is an admitted fact that electrically the nation is well behind the times, and the remedy can only be supplied by those to whom the development of electrical appliances is of past consequence—the manufacturers.

Improving Selling Methods.

To no group does the Prince's admonition apply with greater weight than it does to the electrical trade and it is the purpose of these articles to show how selling methods may be improved, how new fields of electrical usage may be exploited, how the age of electricity may be an accomplished fact in this country instead of a happy phrase of immense value at public and other banquets.

So far as the export side of the electrical industry is concerned, the figures are by no means unsatisfactory. Indeed, in this department of our business there is much to be admired and many lessons can be given to other industries as to the methods of securing overseas business and what is even more important, holding it against all comers.

It is the home market that has been the Cinderella so far and perhaps the simile will prove to be a happy one. The time may come when the fairy coach will be heard and the sister who has had so little attention may become the belle of the ball.

After all, there are many, many things much more difficult to sell than electrical equipment. There is still a considerable amount of novelty about electricity as an industrial force, and as a concomitant of modern existence.

There are said to be 30 000 000 consumers of gas, with some 9 000 000 meters in use. How do these figures compare with their electrical equivalents? Of the 10 000 000 or so homes in this country something like 75% still remain without any sort of electrical service in spite of the fact that the availability of electricity supplies is continually increasing.

It is agreed of course, that as a public utility electricity is comparatively a newcomer. But the advantages of electricity are so many and so obvious that lateness in the field does not provide a serious handicap if only the merits of electricity are advocated effectively and continuously. The growth in gas consumption in this country is in fact a high tribute to efficient salesmanship, and in this regard salesmanship itself may well be defined.

Briefly, salesmanship consists in creating a desire and then satisfying it. The creation is one thing—the satisfaction quite another. We must get more efficiency into our ways of providing electrical service if we are to come into the electrical age.

A Personal Case.

I have a case in mind, and it is by no means unique. I bought a house some eight months ago, and four months afterwards I sent a cheque to the local electricity supply undertaking to pay for the laying of a cable. Simultaneously I gave an order to an electrical installation contractor to wire the house and put in fittings. I hope to move into the house next week; but I shall have to buy paraffin lamps because the cable is not laid and the fittings are not finished.

I take leave to say that the gas undertaking would have had its work completed long before this. As it is, the only people who have functioned to time are the Post Office Telephone Department. The new telephone instrument has been ready to connect since Christmas when the house was to have been ready for occupation.

This is only one trivial example, but it is certainly significant. It shows a lack of salesmanship in the real sense of the word. I get no satisfaction if I telephone the electricity undertaking, and my letters *always* seem to miscarry. In fact, I could almost regret ordering electrical service in preference to gas—the cost of laying cables was approximately the same as that of laying gas pipes.

Again, taking the personal example, not a soul has been near me from the electricity undertaking to see if I want fittings or lamps or shades or anyone of the hundred delightful things which a supply of electricity makes available.

It so happens that my present house has gas only, and so I am at the moment a buyer of all things electrical—a fact that efficient sales management on the part of the local electrical concern should have ascertained as soon as my cheque for putting in the supply was received.

Some readers may say that this case of mine is exceptional. That there must be some local reasons why I have been—to use the colloquialism "messed about." But *is* mine an exceptional case? Does there not still remain a good deal of casualness concerning the customer's point of view that is reminiscent of the days when it represented something in the nature of a favour to allow a man electrical service?

I do not think we have yet come to a realisation of the possibilities of the home market, and until we do we cannot hope to tackle it with anything like the success we have met with overseas.

It is desirable to emphasize this point: a thriving home market must be of invaluable assistance to the export trade in the electrical, as in other industries. Big turnover means a general reduction in overheads all the way round, and the lower our costs of production the greater our competitive ability in every market we seek to enter.

Let us develop the big potential market we have here at home simultaneously with the continuation of our successful attack on the markets of the world and we shall have the British electrical industry on a basis of such prosperity that the electrical age will be a phrase with a new meaning—a phrase that denotes a higher standard of personal, civic and national well-being.

In a subsequent article, I propose to outline some of the methods whereby the home electrical market may be cultivated with advantage.

THE IDEAL HOME EXHIBITION.

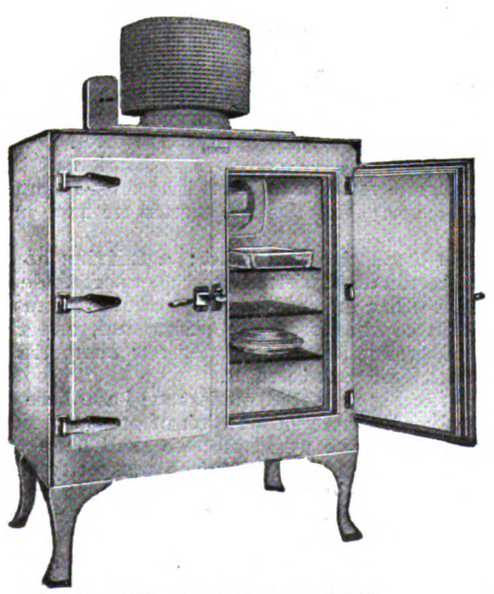
Items of Electrical Interest at the Olympia Show—New Refrigerators, Dish Washers, Cookers, and Other Domestic Equipment.

THE Ideal Home Exhibition which opened at Olympia, London, on Tuesday, again includes a number of stands devoted to domestic electrical appliances and equipment. The centre piece of the exhibition is an electrically-operated fountain put into operation by the BRITISH THOMSON-HOUSTON CO., LTD. This fountain has a lower basin of 30 feet diameter mounted 14 feet above the ground, with a tower in the centre supporting a further basin, 16 feet in diameter. In this upper basin are five banks of nozzles, the water from which is controlled both as to height and variation by automatic devices. At one moment water from the centre nozzle is projected to a height of nearly 60 feet above the ground, and at the next the jet recedes to within a few feet of the basin. Similarly, the other nozzles and sprays are controlled so that there is a continuous sequence of jets which rises at regular intervals to a height of 30 feet. These jets produce a cascade, which is subjected to rapidly-changing colour effects, produced by means of a battery of 30 B.T.H. floodlight projectors concealed beneath the water in the upper basin. In operation there are six changes in the water effects in eight minutes, while twelve different colour effects are produced every minute. In addition to the illumination of the cascade formed by the water jets, further effects are provided by the illumination, in changing colours, of the water flowing over the weir from the upper to the lower basin. This is achieved by means of 120 colour-sprayed Mazda lamps. All the apparatus for operating the fountain, consisting of a motor-driven centrifugal pump for producing the required water pressure, the electric flashing devices for controlling the colour and water effects, electrically-operated water valves and switchgear for controlling the floodlights, is housed in the central tower, the whole being remote-controlled from a push button station situated, in this case, in the supporting structure. The electrical and water connections were carried out by GRIERSON, LTD., Bloomsbury Square, London, W.C.1.

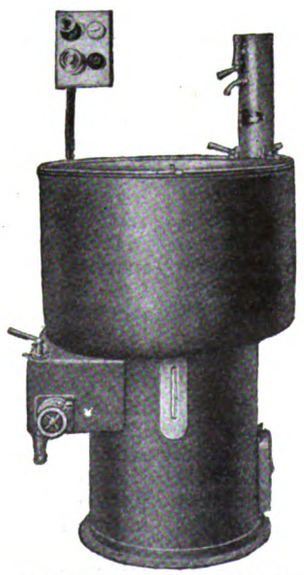
The exhibits on the stands reveal many new electrical appliances including a new range of fires by the GENERAL ELECTRIC CO., LTD., an automatic cut-out kettle, and a new wash boiler. This same firm is also showing new types of cookers in different sizes. A novelty exhibit on the stand is a large model of the automatic cut-out section of the new kettle. A demonstration kitchen, and a range of "architectural" lighting fittings are included, while the stand itself is so arranged that a clear view of the whole is seen from all angles. The stand takes the shape of an octagonal kiosk, with a pillar of light as the centre motif.

As in past years, the exhibition includes a wide range of vacuum cleaners by all the well-known makers, as well as refrigerators, small domestic appliances and so on. These have all been previously described in THE ELECTRICIAN, and though further description is not necessary, such stands as those occupied by HOOVER, LTD., the BRITISH VACUUM CLEANER AND ENGINEERING CO., LTD., VAMPIRES, LTD., the ELECTRIC APPLIANCES CO., LTD., the TELLUS SUPER VACUUM CLEANER, LTD., VAC-TRIC, LTD., MARCO REFRIGERATORS, LTD., KELVINATOR, LTD., L. G. HAWKINS AND CO., LTD., ELECTROLUX, LTD., and FRIGIDAIRE, LTD., are all worthy of the attention of the trade.

Among the new cookers at the exhibition may be mentioned the "Colonial" shown by the JACKSON ELECTRIC STOVE CO., LTD. This comprises an oven with cooking space 13½ in. high by 13¼ in. wide by 15½ in. deep, loaded to 1 650 W, and fitted with a drop-down door. The oven is surmounted by a hob fitted with a grill-boiling plate of 1 800 W and two hot-plates of 1 500 W each. All the units mentioned are arranged for 3-heat control by switches and fuses fitted in the control space on the side of the cooker. Both the oven and hot-cupboard are fitted with white panels mottled grey inside. Electric cookers are also shown by L. G. HAWKINS AND CO., LTD., a special demonstration kitchen being attached to the stand. The same exhibit includes washing and ironing demonstrations. Domestic labour-saving devices and cookers are the chief items of interest on the stand of the REVO ELECTRIC CO., LTD., in addition to fires and small appliances and water heaters. The well-known laundry equipment, cookers, and small appliances of THE HOTPOINT ELECTRIC APPLIANCE CO., LTD., are again featured, demonstrations being an added interest. The outstanding feature of the exhibit of the HURLEY MACHINE CO., is the new combination—washer, wringer and automatic ironer for domestic use. This machine claims to combine in one unit all the advantages of three separate machines. The new Thor vacuum cleaner is also shown. On the stand of THE BRITISH THOMSON-HOUSTON CO., LTD., is shown a range of automatic electric refrigerators, several models being in operation. A visit to this company's stand is well worth while, for there are, in addition to electric lighting equipment, a number of new fittings. Another interesting exhibit is the "Bulle" clock, shown by the BRITISH HORO-ELECTRIC, LTD. This is driven by a small renewable dry battery which is as accessible as is that of an electric torchlight. Electric pads and blankets are again to be seen on the stand of THERMEGA, LTD., while artificial sunlight equipment is featured by ELECTRO RAYS, LTD. A new studio lamp for photographic purposes is shown by PHILIPS LAMPS, LTD., together with a comprehensive range



The new refrigerator shown by the British Thomson-Houston Co., Ltd.



The "Pixie" electric dish washer by The General Electric Co., Ltd.

The "Colonial" cooker of the Jackson Electric Stove Co., Ltd.

Digitized by Google

of all lamps including those for special purposes. The "Photomirenta" lamp shown claims to simplify and lessen the cost of night portraiture for amateur and professional photographers and renders the use of magnesium and arc lamps unnecessary. It consists of a 500 W gasfilled opal lamp, having half the bulb silvered to form a mirror, thereby increasing the intensity of light in one direction.

The RELIANCE TELEPHONE CO., LTD., is giving at the show demonstrations of automatic exchange telephone systems. The auto-intercommunication system has been designed for use in offices, works, banks, hospitals, etc., and is suitable for installation from two lines upwards. The "G.E.C automatic" private exchange telephone systems are represented on the stand by 25 line and 50-line exchange units, but larger equipments are, of course, made by the company. A number of useful telephone accessories are also shown, such as a range of "Magnet" extending arms; hygienic glass mouthpieces, phonopads, etc.

Country house lighting sets similar to those displayed at the British Industries Fair are shown by PETTERS, LTD., while in the village of "Welcome In" may be seen examples of inter-room telephones by BUROVOX, LTD., country house lighting sets by the KOHLER CO., LTD., "Cosyglo" fires by SIEMENS ELECTRIC LAMPS AND SUPPLIES LTD., fittings by GALSWORTHY, LTD., FALK STADELMANN AND CO., LTD., and MODERN ELECTRIC HOMES, LTD.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Glass Insulators."

[TO THE EDITOR.]

SIR,—We have noted Mr. North's reply in your issue of February 22nd, to the various criticisms of his article on "Glass Insulators," and we regret we have to trouble you again to correct further mis-statements.

It is regrettable that Mr. North should attempt to criticise a product about which he shows such an apparent lack of knowledge. In justice to ourselves and other porcelain manufacturers, we should like to take this opportunity of informing Mr. North that insulators are glazed with the sole object of presenting a smooth surface to which dirt will not readily adhere.

Mr. North is wrong in saying that the glaze may conceal porous porcelain. The opposite is nearer to the truth, because porosity, which is nearly always due to underfire, is very often indicated by the appearance of the glaze.

With regard to the temperature cycle test, the fact that insulators which pass this test can withstand the application of a flashover voltage for five minutes without breakdown is sufficient proof that they have suffered no damage. Mr. North has not informed us whether a glass insulator is capable of withstanding this test.—We are, etc.,

TAYLOR, TUNNICLIFF & CO., LTD.

February 25th.

Overhead Electric Lines.

[TO THE EDITOR.]

SIR,—Will you please allow the writer space to accurately present mal-interpretations he gave on page 271, Jl. I.E.E., of February, 1929. In the first column of page 247 it is stated: His tests are quite as important as those described in the present report, because they give the limit for a rigid base, whereas the present report gives the same tests . . . . This should read: The Wade tests are more important than those described, because they give the true internal moment of pole by using a rigid base, whereas the present report gives certain tests for . . . . .

Also in the right column of page 247 (same distance up the page) which reads: If we want to get the maximum strength, not maximum possible bending moment. . . . This should read: If we want to get the maximum strength or maximum possible bending moment. . . . It would also seem necessary to add that my remarks had nothing to do with the use of sawn wood, nor with concrete foundations, and about as little with stays. They refer almost exclusively to the testing of a wood pole or a frame so that its true strength is obtained. Surely Mr. Woodhouse does not recommend sawn timber for a pole, which latter is one leg of a frame? Surely he does not consider a wood pole foundation (such as a concrete foundation for a wood pole) that completely stops drainage and ventilation from the pole, to be satisfactory? And, surely he would stay, or stub-stay or strut or support in some way a pile or a frame subjected to the lateral pull (or a longitudinal pull) of the character referred to in the paper as actual practice, etc., and, surely he would divert any such dangerous point of the line where it is impossible to support it for any reason whatsoever? Surely, good practice can be interpreted as the highest strength at reasonable cost, and highest strength surely means greatest safety? Hence, interpreting the three conditions mentioned, is it not evident that the best practice demands that we use the natural grown and trimmed and treated tree, not sawn timber; avoid any type of foundation that rapidly causes decay or rapidly decreases the pole-timber factor of safety, such as a solid concrete foundation does; and always use supports (stay or stub-stay or stub or any other means) where the transverse force is of the nature referred to by Mr. Woodhouse. These three conditions would therefore seem to differ widely from the views expressed by Mr. Woodhouse.—I am, etc.,

WILLIAM T. TAYLOR.

London, N.2.

Qualification for Wireless Trade Membership.

[TO THE EDITOR.]

SIR,—Your correspondent "Amused," in the issue of your journal of February 15th, has apparently been indirectly hit by the well-known figure who is the anathema of the established wireless retailer—"the dabbler." That epithet, it should hardly be necessary to explain, personifies the thousands, perhaps the tens of thousands, of mechanics, railwaymen, employees of shipyards, engineering firms, etc., who have been, and, in the main still are, obtaining trade discounts.

They are wage earners in most cases, and consequently have no rent, rates, taxes or overhead charges to pay. In the great majority of cases they have only the slightest smattering of technical knowledge, but they manufacture sets of sorts and sell them. Let it be added that they carry no stock in the ordinary sense of the word.

Some little time ago a questionnaire circulated by the W. R. A. elicited the fact that established retailers variously estimate that they are losing from one-third to one-half of their trade through the operation of these individuals.

Now, it will be seen that the broad distinction between responsible dealers and dabblers is that the former occupy business premises and carry a stock, and that the latter do not.

In order to meet the paramount need of excluding non-trade competitors it is hard to conceive how any other methods of differentiation could be devised. Once the stock-in-trade condition is modified the field is immediately widened, and numerous undesirable elements might endeavour to find their way inside.

Your correspondent may accept our assurance that the W. R. A. does not encourage applications for membership from the types of shopkeeper he enumerates, and that it *does* regard technical ability as a highly desirable attribute.

So far as this Association is concerned, however, every application is considered on its merits, and the specially appointed Election Committee has full discretion to extend the scope of eligibility in cases where circumstances appear to warrant such a course, although it must be stated that trade references are essential.—We are, etc.,

CLIFFORD AND CLIFFORD,
Hon. Secretaries, Wireless Retailers' Association.

70, Finsbury Pavement,
London, E.C.2.
February 18th.

POINTS OF VIEW.

What we need in the present economic conditions is Home Rule in industry.—*Sir Harold Bowden.*

"PROSPERITY."

I.E.E. President's Prescription at Batti-Wallahs' Luncheon.

NEARLY 130 members of the Batti-Wallahs' Society and their guests were present at the Society's February luncheon at the Hotel Cecil, London, on Wednesday, Mr. R. W. Hughman (the president) in the chair. The guests included, in addition to Lt.-Col. K. Edgcumbe, president of the I.E.E., no fewer than four ex-presidents of that Institution.

After the very witty speech of introduction by Mr. Hughman, Col. Edgcumbe, the guest of the day, might have had some difficulty in getting back to "Prosperity," the subject of his address, but he effected the transition in a very happy way. Prosperity, he said, had come to be regarded as synonymous with high pay and low prices, but the only real measure of properity was the amount of products which an average day's work would provide. The figure reflected by real wages varied enormously in various countries, and the answer to the question why did it vary, was that it was axiomatic that a nation could not consume more than it produced. The politicians naturally obscured the issue in various ways, but it was impossible to get away from the fundamental fact that the average man could only consume what the average man produced.

It was quite clear that in order to increase productivity, i.e., the real wages, there must be an increase in the commodities we produced.

In his presidential address to the I.E.E. he had shown that the proportionality between real wages and productivity in a number of countries lay almost in a straight line.

It followed that unemployment would water down the output of those who were employed, and thus reduce the prosperity of the nation. On the other hand, an increase in output naturally increased the prosperity of the country.

When he asked an American what was the reason of their prosperity, he had replied with the one word: productivity.

Logically, if we increased the production of all goods equally, there would necessarily be a surplus of some things. A readjustment of labour was, therefore, necessary.

Putting aside all views on the merits and demerits of Free Trade or Protection, Col. Edgcumbe thought there would be general agreement that at a time when unemployment was rife in the country we should not continue to import so many manufactured goods as we were now importing. If we could reduce our imports of manufactured goods by £140 000 000 a year we would practically solve the unemployment problem. At the very worst, such action would mean an increase of about 2d. in the £ to all of us on our purchases. As the first step to prosperity was to do away with unemployment, this was a small price to pay.

This done, we should increase our output in every possible direction, for there was little doubt that the demand would come. But we must not count on Governments for assistance. It was difficult to imagine that politicians would have much success in the building of turbo-alternators, but they knew no less about that work than they did about economics, and if put to it, would probably do far less harm in that sphere than they were doing at present.

Viewed in the light of recent improvements in the coal and the iron and steel trades, the decrease in the numbers of unemployed during the present year, to say nothing of the winning of four Test matches, Col. Edgcumbe thought the outlook was fairly promising.

Disraeli had said that success depended upon constancy of purpose, and if only we could determine the purpose about which we wanted to be constant, we would have little to fear from competitors. His suggested purpose was: "Boost Home Output, and Buy British Goods."

It was announced at the luncheon that Sir Hugo Hirst will be the guest of honour on April 25th.

MARCONI PATENTS.

On Wednesday, in the Chancery Division, Mr. Justice Luxmore had before him two petitions by Marconi's Wireless Telegraph Co., Ltd., against decisions of the Comptroller-General and Assistant Comptroller-General of the Patent Office, in favour of the Brownie Wireless Co., Ltd., and the Loewe Radio Valve Co., Ltd., concerning royalties.

It was pointed out that the appeal was against the decision of the Comptroller-General and the Act said it should be an appeal against the "Tribunal Order." That order had not been drawn up. His Lordship directed the appeals to stand over.

NEWS IN BRIEF.

AN assistant electrical engineer is required by the Madras and Southern Mahratta Railway Co., Ltd.

During January, Burnley Electricity Department fixed, on hire or hire purchase, 114 radiators and cookers.

Telephonic communication between Turin, Italy and Buenos Aires, a distance of 6 500 miles, has been established.

Douglas Corporation has decided to adopt electric light at the abattoirs and to invite tenders for the installation work.

Teddington U.D.C. is about to instal an electric syren at the Council offices, for summoning the Fire Brigade, at a cost of £95.

Portsmouth electricity department is to carry out re-wiring of electric circuits at the Guildhall, at an estimated cost of £1 472.

Croydon Electricity Committee recommends the acceptance of tenders for the erection of sub-stations amounting to £412 10s.

Glasgow Health Committee recommends the installation of three-phase X-ray equipment at Ruchill Hospital, at a cost of £2 000.

Glasgow Electricity Committee recommends the acceptance of tenders for the erection of sub-stations at Cathcart Road and Ledard Road.

Mr. F. Westlake Parkinson addressed members of the Belfast Insurance Institute last week on "Electrical Wiring in Relation to Fire Hazards."

Tenders have been received for the electrification of the Heluan railway line to Cairo. The lowest was that of the English Electric Co., £261 573.

The Great Western Railway Co. is to provide private siding facilities at Stourport for the Shropshire, Worcestershire and Staffordshire Electric Power Co.

Blackburn T.C. has decided that 202 working-class dwellings which are being erected in the town, shall be equipped for gas and electricity, at a cost of £1 111.

Rotherham Health Committee recommends the provision of ultra violet light treatment at the Cranworth Road child welfare centre, at an estimated cost of £150.

Sunderland Town Council has decided that the electricity and tramways departments shall pay next year £5 000 each to the rates in respect of "monopoly value."

At last week's meeting of Bristol Corporation Housing Committee it was reported that provision had been made for wiring a number of houses for electric lighting.

Douglas Electricity Committee has authorised the Borough Electrical Engineer to arrange to exhibit at the Trades Exhibition at Villa Marina, at a cost not exceeding £200.

With the object of improving facilities for handling increasing import traffic of Sunderland, the River Wear Commissioners have recently installed four new five-ton electric cranes.

Bolton Electricity Committee is dealing with an assisted wiring scheme and also a proposal for the hiring of meters for electrical advertising signs, shop window lighting, etc.

It is stated that electricity required at the "Forum" Cinema, Villiers Street, London, is being produced by an independent plant at not more than a halfpenny per kWh.

The Governors of Southwell Minster Grammar School have received the approval of the Board of Education to the expenditure of £74 on an electric light installation in the school.

The fourth Palestine and Near East Exhibition will be held in April at Tel Aviv. There will be sections for electrical and wireless goods. Particulars from Mr. G. Bradlaw, c/o Palestine Electric Corporation, 3, Bedford Square, London, W.C.2.

The Scottish Students' Section of the Institution of Electrical Engineers met last week at the Electric Lighting Service Bureau, Trongate, Glasgow, when an address was given by Mr. W. Imrie Smith on "Modern Illumination and its Development."

The London County Council (Co-ordination of Passenger Traffic) Bill and the London Electric Railways (Co-ordination of Passenger Traffic) Bill were read a second time in the House of Commons on Tuesday, and it was decided to send the former to a Joint Committee of Lords and Commons.

At the recent annual dinner of the members of the Portsmouth Area of the Electrical Power Engineers Association, Mr. A. V. Sendell, vice president of the Association, said the National Executive had at last amended a rule of the Association so that the engineer engaged in the manufacturing industry was entitled to become a member.

Digitized by Google

PERSONAL.

MR. J. W. Simpson, formerly town clerk of Thornaby-on-Tees, has been appointed secretary of the I.M.E.A.

St. Helens Town Council has increased the salary of the borough electrical engineer, Mr. Robert Lee, from £800 to £850 per annum.

Croydon Electricity Committee recommends that the salary of Mr. A. C. Cramb, borough electrical engineer, be increased from £1 500 to £1 600 per annum.

Stockport Town Council has appointed Mr. William Leighton Chubb, of Stoke-on-Trent, as mains superintendent. There were 63 applicants for the post.

Lord Birkenhead will be the principal guest of the British Electrical Development Association at the annual dinner to be held at the Piccadilly Hotel, on March 14th.

Mr. Colin Cameron Kirby (Salford electricity works) and Mr. Frank Morgan (West Midlands Joint Electricity Authority) have been elected as associate members of the Institution of Civil Engineers.

Mr. Ralph Lomax, borough electrical engineer, Stockport has resigned, and at his request has been paid six months' salary in lieu of notice. The post is to be advertised, the commencing salary being £1 000 per annum.

Mr. J. W. Fawcett, electrical engineer to Holmfirth Urban Council, has resigned, and accepted the position of resident engineer with the South East Yorkshire Power Co.

Barrow-in-Furness Corporation is recommended by the Standing Sub-Committee to increase the salary of Mr. H. R. Burnett, borough electrical engineer, from £850 to £900 per annum.

We regret to announce that Mr. F. H. Nalder, of Nalder Bros. and Thompson, Ltd., has been seriously ill, and has been confined to his house for over two months. We understand he is making satisfactory progress, and wish him a speedy recovery.

The Lord Provost's Committee of Edinburgh T.C. has agreed to recommend that the freedom of the city be conferred on Sir Alfred Ewing, whose decision to retire from the Principalship of Edinburgh University at the end of the academic year is announced.

At Liverpool University last week, Mr. S. E. Britton, chairman of the Liverpool Centre of the I.E.E., who presided at the annual Faraday lecture, presented Mr. W. Phœnix, of the Warrington Electricity Supply Department, with the Cooper's Hill War Memorial prize (bronze medal, certificate, and money award) for a paper on electricity in agriculture.

The 23 applications for the post of general manager and engineer to the Sunderland Tramways have been reduced to four, and the applicants have been asked to interview a sub-committee. The short list is Mr. C. I. Baker, general manager, Ashton-under-Lyme Tramways since 1922; Mr. C. A. Hopkins, general manager of Wigan Tramways, motors, and trolley-'bus undertakings; Mr. Harry Clayton, general manager of Preston Tramways since 1922; and Mr. H. W. Snowball, rolling stock superintendent, Sunderland Tramways, since 1926.

Obituary.

MR. C. F. WILKINS, on February 21st, managing director of Muirhead and Co., Ltd., Elmers End, Beckenham.

LADY LODGE, wife of Sir Oliver Lodge, on February 20th, in her 78th year. She had been married to Sir Oliver 51 years, and had reared a family of 12.

MR. F. HILL, engineer and manager, Hammersmith (London) electricity department, from pneumonia, on February 13th. Mr. Hill, who was 54 years of age, was engaged in the Bristol electricity department until he entered the Hammersmith Council's service in 1897. He succeeded to the position of engineer and manager, upon Mr. Bell's resignation about five years ago.

MR. THOMAS DUNCAN, at Los Angeles, aged 63 years. Born and educated in Scotland, Mr. Duncan removed to America in 1883. Three years later he entered the works of the Sun Electric Co., Woburn, Mass. In 1887 he became connected with the Fort Wayne Jenney Electric Light Co., and in 1890 he joined the meter department of the Thomson-Houston Electric Company at Lynn, Mass. At the close of the same year he returned to Fort Wayne to take charge of the meter-testing department of the Fort Wayne Electric Light Co. and his first meters were put on the market in 1895. Mr. Duncan became meter engineer for the Siemens and Halske Electric Co. of America in 1898. After the General Electric Co. absorbed the Siemens-Halske Co. he organized the Duncan Manufacturing Company and in 1901 began manufacturing at Lafayette, Ind.

BUSINESS ITEMS.

E. R. MORTON, LTD., 117, Charlotte Street, London, W.1, have been appointed sole London agents for "Lustrolux" electric lamps and valves.

The new showrooms of Best and Lloyd Ltd., at 40, Great Marlborough Street, London, W.1.

H. T. BOOTHROYD, LTD., Bootle, Liverpool, have opened a London office at 62, Great Russell Street, London, W.C.1.

SERVICE AND CO., LTD., electrical contractors, have opened new showrooms at 2, 3, 4 and 5, The Octagon, Plymouth, where a special window display is being made.

The business of JOHN PHILLIPS AND CO., 116/168, Walworth Road, London, S.E.17, has been transferred to BUCK AND HICKMAN, LTD., 2/8, Whitechapel Road, London, E.1, and Mr. Geo. L. Precious, proprietor of the former company, has rejoined the latter, where he was previously employed for 30 years.

IN PARLIAMENT.

Replies to Questions of Electrical Interest Asked in House of Commons.

ON January 31st there were 2 684 941 wireless receiving licences in force in Great Britain and Northern Ireland.

The Postmaster-General does not see his way to remitting the charge for a local call which is made when a telegram is sent by the telephone service.

About £12 400 000 of the £26 500 000 of share capital and reserves of the three telegraph companies embraced by the proposed Communications Co. represent reserves.

The number of prosecutions in 1928 for operating wireless apparatus without licences was 1 135 and convictions were obtained in all but seven cases. The total amount of fines recovered, including costs where granted, was £1 186.

Under the terms of the telephone agreements, a conversation can be terminated after six minutes. In practice, however, the restriction is only enforced when prolonged use of circuits causes inconvenience to other subscribers or where public call offices are concerned.

The cables and wireless merger company intends to acquire all the ordinary shares of the Eastern, Eastern Extension and Western Telegraph Companies. The share capital and reserves of these companies, according to their latest balance sheets, amount to rather more than 26½ million pounds.

The Government will not open negotiations with the new Communications Co. in regard to a transfer of the remaining inland telegraphs. The circumstances under which certain overseas services are to be transferred to a communications company have no analogy in the case of the inland service.

Replying to a question relating to the practice of demanding from subscribers making increased use of the telephone service a larger deposit, the Postmaster-General says the deposit is calculated at approximately two-thirds of the quarterly charges for calls. It is required mainly to help in financing the service during the period of credit.

The Minister of Transport is informed by the Electricity Commissioners that attention has been given to reports by Dr. Waldo, the coroner for the City of London, containing recommendations regarding electrical explosions and fire prevention, and that they are at present engaged upon the revision of the existing regulations for securing the safety of the public and for ensuring a proper and sufficient supply of electrical energy.

THE SOCIAL SIDE.

THE A. T. M. Golf Club, whose membership is drawn from the personnel of the Automatic Telephone Manufacturing Co., held its fourth annual dinner on February 16th, at the Childwall Abbey Hotel, and Mr. T. A. Eades presided. Apart

Mr. T. A. Eades presenting the "Burch" trophies to the winners, Messrs. J. J. Langley and A. Speight, at the A.T.M. Golf Club dinner.

from some enjoyable musical items, a novel entertainment followed the dinner, taking the form of a film display showing well-known members of the club at the top of their form—and otherwise—on the Bowring Park Course. The prizes and trophies won during the season were presented by Mr. Eades, the various winners being as under:—"Tay-Mel" Cup, Mr. J. J. Langley; "Burch" Trophies (two ball foursome), Messrs. J. J. Langley and A. Speight; "Smith" Cup, Mr. R. C. Eastwood; "Niblock" Cup (mixed foursomes, Miss M. H. Kidd and Mr. R. E. Boyd; Captain's prize (bogey competition), Mr. R. E. Boyd; Lady Captain's prize, Mrs. R. E. Boyd; Mr. T. A. Eade's prize, Mr. F. M. de Borde; and the Gold Medal, Mr. A. G. Kidd.

Over 200 persons attended the concert and social of Blackpool Electricity and Tramways Employees' Institute. The M.C.'s were Mr. J. Appleton, sen., and Mr. W. Pratt.

The annual ball of the Liverpool Corporation Tramways Social and Athletic Society was held last week. As the number of employees and friends who attended was 3 000, the function was held on two evenings.

The Scottish Central Electric Power Co.'s operating staff recently held their annual dance in the Plough Hotel, Falkirk. The company numbered about 90, and Mrs. Brown, wife of Mr. H. Brown, assistant manager, distributed spot-dance prizes.

The annual dinner of the North Midland Centre of the Institution of Electrical Engineers will be held at the Hotel Metropole, Leeds, on March 12th. Lt.-Col. K. Edgcumbe will be amongst those present. Tickets, exclusive of wines, 12s.; students, 10s. Mr. H. Cecil, 36, Park Lane, Leeds, is hon. secretary.

At Barking electricity department's "Sparks" Social and Sports Club annual dinner, at the "Red Lion" Hotel, Barking, Mr. W. E. Kidner presided, in the absence of the president, Mr. W. Holmes, through indisposition. Mr. Kidner said he had inside information which enabled him to see that they would have a very prosperous year, so far as the undertaking was concerned.

The dinner of the Joint Delegation of the Local (Yorkshire) Associations of the Institutions of Civil, Mechanical, Electrical, Municipal and County, Locomotive and Structural Engineers will be held to-day (Friday) at the Great Northern Hotel, Leeds. Tickets (exclusive of wine, 12s. 6d.; student members, 10s.) from Mr. A. N. G. Wood, hon. secretary, 65-67, Prudential Buildings, Park Row, Leeds.

The Liverpool Electro-Harmonic Society will hold its annual "members' night" on March 22nd, when members of the Manchester Electro-Harmonic Society will be the guests. The function will take the form of a hot-pot supper and concert at the St. George's Restaurant, Redcross Street, Liverpool. Tickets may be obtained from the hon. secretary, Mr. E. G. Pulford, jun., of Messrs. Pulford Bros., Ltd., 104, Whitechapel, Liverpool.

THE A.S.E.E. DINNER.

Views on Multiplicity of Associations—Salesmanship and the Commercial Engineer.

THE annual dinner of the Association of Supervising Electrical Engineers was held on Saturday, February 23rd, at the Hotel Cecil, London, with Mr. S. B. Donkin in the chair.

Mr. A. H. DYKES, in proposing the toast of "Our Guests," pointed out that the presence of such guests as Sir Brodie Henderson, Sir Wm. Noble, Mr. G. Scott Ram, Lt.-Col. Kenelm Edgcumbe, and others, indicated the growing importance of the association, which, though only formed in 1914, had not only maintained its original ideals, but had assisted its members to improve their knowledge of electrical engineering, and established a satisfactory apprenticeship scheme, while in some cases, members of the association had delivered papers of importance, as well as contributed to the discussion of others. Though in his opinion it was a pity that all the engineering institutions were not one body embracing all classes of engineering, the part played by the Association of Supervising Electrical Engineers was something of a liason between the workers and those in higher authority, a liason, which, under present industrial conditions, was of extreme importance.

Sir BRODIE HENDERSON, President of the Institution of Civil Engineers, responded, and said that whatever may have been known of electricity before, it was only during the last fifty years that practical use had been made of it, and as great as had been its progress during those years, its future promised to be equally progressive. He did not agree that all engineering institutions should be grouped together to form one society, for though this was done to some extent in the United States, the conditions here, and the methods employed, were not the same.

Sir WILLIAM NOBLE also replied to the effect that though it would perhaps be convenient to have one engineering society in the country, progress had been such as to demand the present number of individual associations. The present Institution of Electrical Engineers, it would be remembered, started its life as the Society of Telegraph Engineers, but the progress made in the application of electricity as a power and lighting medium, introduced into the society papers subjects inappropriate to an association of telegraph engineers, with the result that telegraph engineers broke away from the parent body and formed their own association.

Lt.-Col. KENELM EDGCUMBE, President I.E.E., proposed the toast of "The Association," and explained his presence by the fact that the I.E.E. and the A.S.E.E. had much in common. He did not agree with the forming of new associations, for he believed that there were already too many, but of those that were necessary the A.S.E.E. was one of the most important. A point of considerable interest to him was the marked absence of unemployment among members. Trade unions as a whole had a tendency to level down wages, but the A.S.E.E. took the view of encouraging study and the acquisition of knowledge, and while this was the policy of the association, he believed that the industry would give its best support.

Mr. S. B. DONKIN, President of the Association, in reply, drew attention to the fact that the association was now 15 years old, during 11 years of which it had been a trade union. Its membership had steadily increased by about 10 per cent. each year, in spite of the high standard demanded of applicants for membership. The association was now represented on the I.E.E. Wiring Rules Committee, the B.S.S. Conduits Committee, and was now considering representation on the B.E.S.A. Accessory Committee. During the last two years, the association had produced the "Employers' Guide to the I.E.E. Rules," while further advances were made with the apprenticeship scheme. The Appointments Committee had done very useful work, and had, through the Employment Board, found employment for 500 men during 2½ years. With members' permission he proposed to present the association with a badge, the English motto for which would probably be "Ease to Progress."

Mr. L. W. MEDCALFE, Chairman of the Association, also replied, drawing attention to the remarks of the Prince of Wales on Salesmanship. He believed that the views held by the association were that though there was room for a number of non-technical salesmen, there must be for the utmost success what is termed the commercial engineer to form a link between the buyer and the producer. The A.S.E.E. had encouraged such engineers believing it to be in the best interests of the industry to do so.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

VICTORIA PICTURE HOUSE, KETTERING.—Installation of electric lighting plant. Tenders to the Secretary, Gold Street, Kettering.

STOKE-ON-TRENT CORPORATION, March 1st.—Supply of overhead cables to X-ray block and laundry, Stanfield Hospital. Specification, etc., from the City Electrical Engineer; deposit £2.

WATFORD CORPORATION, March 1st.—Wiring of lighting and heating points in dwelling houses, in connection with house wiring schemes. Particulars from the borough electrical engineer, Mr. A. W. Barham, Cardiff Road, Watford.

CAMBRIDGE CORPORATION, March 2nd.—Twelve months' supply of electric lamps (schedule 16), etc. Forms of tender, etc., from the Borough Engineer.

CENTRAL ELECTRICITY BOARD, March 2nd.—Supply and erection of 33 000 V overhead line—Luton to Aylesbury—in connection with the South-East England Electricity Scheme. Specification (No. S.E.E.-S.L. 2) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 2nd.—Supply and erection of 66 000 V and other transformers in the London area, in connection with the South-East England Electricity Scheme. Specification (No. S.E.E.-L.T. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity, Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

SCARBOROUGH CORPORATION, March 2nd.—Manufacture and supply of e.h.t. switchgear (specification 3/29), l.t. switchgear (4/29), transformers (5/29), kiosks (6/29) and e.h.t. cable (7/29). Specifications from the Borough Electrical Engineer.

BROMLEY EDUCATION COMMITTEE, March 4th.—Electric lighting installation in Raglan Road Council School. Particulars from Mr. W. G. Trend, borough electrical engineer, West Street, Bromley.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 kV outdoor switchgear, for transforming stations, in the area covered by the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-P.S.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 000 V transformers in connection with the North-West England and North Wales Electricity Scheme Specification (N.W.E.-P.T. 1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

DOVER HARBOUR BOARD, March 4th.—One year's supply of electrical sundries and cables. Particulars from the registrar, Mr. Rutley Mowll, Castle Street, Dover; deposit, 2s. 6d. for each schedule.

ERITH URBAN DISTRICT COUNCIL, March 4th.—Supply of h.t. and l.t. underground cables, joint boxes and other accessories during 12 months. Particulars and form of tender from the Electrical Engineer, Walnut Tree Road, Erith.

OBAN CORPORATION, March 4th.—Electric lighting work, in connection with erection of three-storey tenement at Soroba Road, Oban. Specification, etc., from the Burgh Surveyor.

SOUTHEND CORPORATION, March 4th.—Supply of 1 200 d.c. electricity meters. Full particulars from the Borough Electrical Engineer.

LEEDS CORPORATION, March 5th.—One year's supply of materials to the tramways and transport department, including electrical sundries, bitumen compound, electrodes, etc. Specification, etc., from Mr. R. L. Horsfield, general manager and engineer, 1, Swinegate, Leeds.

RACECOURSE BETTING CONTROL BOARD, March 5th.—Supply and erection of equipment for mechanical control of racecourse betting transactions in Great Britain. Specifications, etc., from Mr. J. R. Chambers, Secretary, 33, St. James's Street, London, S.W.1; deposit, £2 2s.

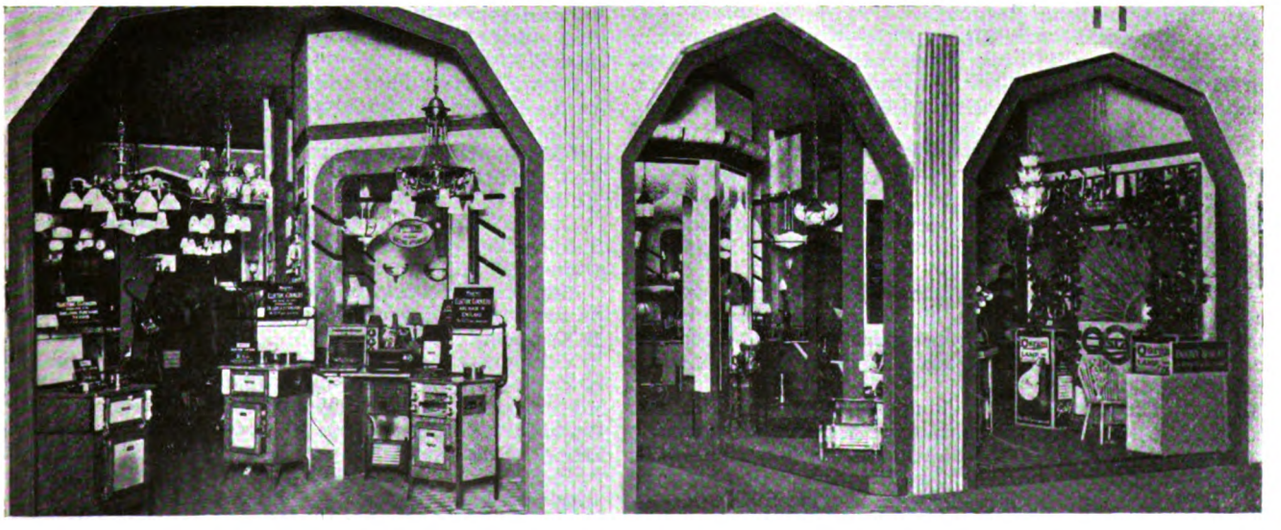
CENTRAL ELECTRICITY BOARD, March 6th.—Supply and erection of 66 000 V switchgear, for South-East England Electricity Scheme (London area), and supply and erection of 132 000 V transformers. Specification from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

CLACTON URBAN DISTRICT COUNCIL, March 6th.—Manufacture, supply and erection of two automatic, remote control, rotary converters; e.h.t. and l.t. switchgear, at Walton Road sub-station. Specification from the Electrical Engineer and Manager, 1, Arcade Buildings, Station Road, Clacton-on-Sea; deposit £1 1s.

HOLBEACH GUARDIANS, March 6th.—Electric light installation at the institution. Particulars from the clerk, Mr. S. S. Mossop, jun.

MANCHESTER CORPORATION, March 6th.—House wiring material, for assisted wiring and hired apparatus systems. Specification (No. 231) from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

STOKE-ON-TRENT CORPORATION, March 6th.—Supply and erection of l.t. ironclad board, for power house extension,



THE stand of the General Electric Co., Ltd., at the Ideal Home Exhibition, which opened at Olympia on Tuesday. A review of the exhibits of electrical interest is given on page 270, while our comments on the absence of all-electric houses at the show are given on page 258.

Digitized by Google

1929. Specification, etc., from the City Electrical Engineer; deposit £2.

CROYDON AND DISTRICT JOINT SMALL POX HOSPITAL BOARD, March 7th.—Electric light installation in the various buildings at the Sanatorium, Cheam, Surrey. Specifications, Mr. G. F. Carter, Town Hall, Croydon; deposit £3 3s.

STEPNEY (LONDON) GUARDIANS, March 7th.—Six months' supply of electrical fittings, etc. Forms of tender from Mr. S. McClelland, clerk, Administrative Offices, Bancroft Road, Mile End, E.1. Stamped, addressed envelope to be sent.

WALSALL AND WEST BROMWICH UNIONS JOINT COMMITTEE, March 8th.—Supply of electric fittings, etc. Forms of tender, etc., from the Clerk, 22, Lombard Street, West Bromwich.

LEEDS CORPORATION, March 9th.—Supply of single-phase (2 000 and 6 600 V), three-phase (6 600 V) and Scott-connected transformers, as required over a period of two years; and 11 000 V three-phase transformers (10 500 kVA), for early delivery. Specification from Mr. C. N. Hefford, Electricity Department, 1, Whitehall Road, Leeds; deposit £1 1s.

WARRINGTON CORPORATION, March 11th.—(1) Motors; and (2) transformers. Specifications from the Borough Electrical Engineer; deposit £1 1s. for each.

BELFAST GUARDIANS, March 12th.—Twelve months' supply of electrical fittings, etc. Forms of tender from Mr. R. H. Wilson, clerk to the Guardians.

MANCHESTER CORPORATION, March 12th.—Supply of trucks for electric tramcars. Specifications, etc., from the general manager, Corporation Tramways, 55, Piccadilly, Manchester.

ISLINGTON (LONDON) GUARDIANS, March 14th.—Six months' electrical supplies. Forms of tender from Mr. Albert King, Guardians' Offices, St. John's Road, Upper Holloway, N. 19. Stamped, addressed envelope to be sent.

NORTH BRITISH ALUMINIUM CO., LTD., March 12th.—Supply and installation of all material required for electric power and lighting distribution system, at the company's works, near Fort William, Inverness-shire. Specification, etc., from the Company's Offices, Adelaide House, King William Street, London, E.C.4.

SHEFFIELD CORPORATION, March 14th.—Buildings, civil engineering works and constructional steel work (specification B.M. 64); transformers (B.M. 66); pipework and valves (B.M. 69); e.h.t. three-phase switchgear (B.M. 71); battery locomotive and accessories (B.M.) 74). Specifications (deposit £3 3s. for each) from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield.

EDINBURGH CORPORATION, March 15th.—One 1 500 kW motor-converter, for Dewar Place sub-station. Specification from Mr. E. Seddon, engineer and manager, Electricity Department; deposit 10s. 6d.

BRADFIELD RURAL DISTRICT COUNCIL, March 18th.—Electric motors (with switchgear) for driving air compressors, at Pangbourne sewage works. Specification from the engineer, Mr. C. H. Stafford, 209, King's Road, Reading; or the Clerk, Town Hall Chambers, Reading.

EDMONTON GUARDIANS, March 18th.—Six months' supply of electric lamps, and X-ray, light, massage, etc., requisites. Forms of tender from the Clerk, 77, Bridport Road, Edmonton, London, N.18. Stamped addressed envelope to be sent.

Boiler Equipment.

LANCASTER CORPORATION, March 18th.—Two water-tube boilers, to evaporate 36 000 lb. of water per hour, with mechanical stokers, etc., at Caton Road generating station. Specification, etc., from the Borough Electrical Engineer; deposit £2.

NEWTON ABBOT URBAN DISTRICT COUNCIL, March 18th.—Supply of pumping and other equipment, with electric motors, control panels, etc., for sewer construction works. Specifications from Mr. F. W. S. Stanton, 5, Victoria Street, London, S.W.1.

CARDIFF CORPORATION, March 19th.—Supply of e.h.t. and l.t., paper insulated cables during 12 months, commencing April 1st (specification No. N 64), and supply and erection of natural draught cooling tower (specification N 65). Specifications, etc., from the City Electrical Engineer, The Hayes, Cardiff. Only members of the King's National Roll are invited to tender.

PADDINGTON (LONDON) GUARDIANS, March 20th.—Six months' supply of electricians' sundries, etc. Forms of tender from the Clerk, 313-319, Harrow Road, W.9. Stamped, addressed envelope to be sent.

STOURBRIDGE GUARDIANS, March 21st.—Supplies of electric lamps for six months. Particulars from the clerk, Mr. G. F. James, 12, Hagley Road, Stourbridge.

EDINBURGH CORPORATION, March 25th.—Supply of materails to the electricity department for 12 months, including cables, conduits, fuses and fuse boards, electrical material, electricity meters, meter boards, etc. Specification from the Engineer and Manager, Dewar Place, Edinburgh.

CENTRAL ELECTRICITY BOARD, April 15th.—Supply and erection of 33 000 V overhead transmission lines, in connection with the North West England and North Wales Electricity Scheme. Specification (No. N.W.E.-S.L.2) from Sir J. R. Brooke, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

INDIA STORE DEPARTMENT, March 1st.—Supply of 200 000 insulators (schedule 1), 49 drums dry core telephone cable (schedule 2), and 500 tons g.i. wire (schedule 3). Forms of tender (5s. for each schedule) from the Director-General, Belvedere Road, London, S.E.1.

JOHANNESBURG MUNICIPALITY, March 4th.—Supply of 6 600 V switchgear (Contract No. 126). (Reference B.X. 5 087.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 5th.—Supply of seven single-phase 5 500 kVA transformers, for Waitaki power scheme, section 4. (Reference B.X. 4 873.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 6th.—Supply and installation of underground and overhead cables, for transmission of current from Mit Chamr power works to the town of Kom el Nour. (Reference B.X. 5 074.)

JOHANNESBURG MUNICIPALITY, March 7th.—Supply of 15 miles of 0000 s.w.g. (0·4 in. diameter) round section h.d. copper trolley wire (Contract 128). (Reference A.X. 7 506.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 7th.—Supply of hydraulic accumulator, horizontal ram pump, electric motor, motor or belt driven air compressor, starter and control gear.

MAYO COUNTY BOARD OF HEALTH, March 9th.—Electric lighting installation at Creagh House, near Ballinrobe. Specification from Mr. T. Flanagan, county surveyor, Castlebar; deposit £2 2s.

YUGO-SLAV MINISTRY OF COMMUNICATIONS, March 10th.—Supply of various materials, including electric welding apparatus, machine tools, Diesel engine with electric generator and switchboard, two electric motors (25 and 20 H.P.), various electric generators and other electrical materials, for the River Shipping Board; telegraph and telephone materials, for the Construction Department; electric lighting sets for passenger coaches, for the Machinery Department, etc. (Reference C.X. 2 982.*)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, March 12th.—Supply of telephone relays (schedule C. 408). (Reference B.X. 5 078.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 12th.—Supply of switchboard cords (P. and T. 151/1 247.). (Reference B.X. 5 017.)

CAPE TOWN MUNICIPALITY, March 15th.—Supply of metal-clad switchgear (specification 449/28). (Reference B.X. 5 004.)

CHILEAN MINISTRY OF MARINE, March 15th (extension of date).—Two electric travelling cranes, for Port of Valdivia. (Reference A.X. 7 353.)

VICTORIAN RAILWAY COMMISSION, March 15th.—Supply of armoured telephone cable (contract 4 2501). (Reference B.X. 5 126.)

VICTORIA ELECTRICITY COMMISSION, March 18th.—Supply of 1 300 strings of suspension insulators, 600 strings of tensioning insulators, 1 300 conductor suspension clamps, 350 conductor tensioning clamps, 50 semi-anchor clamps for "V" strings of insulators, 200 semi-anchor clamps for single strings of insulators, 475 earth wire suspension clamps and 125 earth wire tensioning clamps. (Reference B.X. 4 997.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 15th.—Conductor cords (No. P. and T., 151/1 319). (Reference B.X. 5 098.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 17th.—Supply of copper earthplates (specification 133). (Reference A.X. 7 556.)

Digitized by Google

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills, with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., dry cells.

NORTHERN IRELAND GOVERNMENT.—Edison Swan Electric Co., Ltd., supply of lamps.

DOUGLAS CORPORATION.—New Switchgear Construction Co., supply of feeder panel, £126.

STONE (STAFFS) GUARDIANS.—Langley and Co., electric light installation at Institution.

THORNABY-ON-TEES CORPORATION.—T. B. Watson and Son, electric light wiring of library, £87.

BURNLEY CORPORATION.—J. Bennie, Ltd., electric passenger lift at electricity showroom, £514.

EAST HAM CORPORATION.—English Electric Co., Ltd., supply of 1 500 kW motor converter, £4 370.

BEDFORD CORPORATION.—British Thomson-Houston Co., Ltd., supply of switchgear, £18 685. (Recommended.)

GENERAL POST OFFICE.—Standard Telephones and Cables, Ltd., automatic telephone equipment, for Newcastle-on-Tyne.

BRIGHTON CORPORATION.—Tudor Accumulator Co., Ltd., supply of battery, for sub-station at North Road, £6 812. (Recommended.)

FIFE EDUCATION AUTHORITY.—Scott and Co., electricians' work in connection with additions to Beath R.C. Secondary School, Cowdenbeath, £138.

LONDON COUNTY COUNCIL EDUCATION COMMITTEE,—H. J. Cash and Co., Ltd., electrical work at Hammersmith Trade School for Girls, £180.

GILLINGHAM CORPORATION.—Callender's Cable and Construction Co., Ltd., supply of cable, £7 807; Concrete Utilities, Ltd., cable covers, 9d. per yard.

FINCHLEY URBAN DISTRICT COUNCIL.—Premier Cooler and and Engineering Co., Ltd., construction of cooling tower and foundations, £2 336. (Recommended.)

GLASGOW CORPORATION.—Alexander Anderson, Ltd., electric lighting installation in grounds of the Mearnskirk sanatorium, £3 358 10s. 6d. (Recommended.)

CARLISLE CORPORATION.—British Thomson-Houston Co., Ltd., one 350 kW turbo-alternator, £3 061; Stirling Boiler Co., Ltd., supply of boiler house plant, £35 775.

GREAT WESTERN RAILWAY.—Tangyes, Ltd., provision of two electrically-driven pumps, for transit shed No. 2 dock, Barry; and two electrically-driven pumps at Southall.

FYLDE GUARDIANS.—P. J. Frampton, wiring and fitting the institution and offices for electric lighting, in place of the present gas lighting, £2 239. Ten tenders, ranging from £1 500 to £5 000, were received.

LONDON COUNTY COUNCIL.—Charing Cross Electricity Supply Co., Ltd., General Electric Co., Ltd., and Pirelli-General Cable Works, Ltd., improvement of electric lighting on the Victoria Embankment.

EAST HAM CORPORATION.—Brush Electrical Engineering Co., Ltd., supply of two spare tramcar trucks, £300; Bertram Thomas, supply of machine panel, £430; A. Reyrolle and Co., Ltd., supply of h.t. switchgear, £1 389; Taylor Bros., supply of 42 c.i. lamp columns, £3 5s. each. (All recommended.)

BIRKENHEAD CORPORATION.—English Electric Co., Ltd., supply of 300 kVA transformer, £157; W. T. Glover and Co., Ltd., (£312), Macintosh Cable Co. (£300), and British Insulated Cables, Ltd. (£138), cables; British Thomson-Houston Co., Ltd., supply of truck-type transformer cubicle, £131 12s.

ABERDEEN CORPORATION.—Brush Electrical Engineering Co., Ltd., construction of 12 new tramcar bodies and trucks; Electro-Mechanical Brake Co., resistances for same. The Brush Co. will be responsible for assembling the various portions of the cars. The total cost of the 12 cars will be £27 443. English Electric Co., Ltd., equipping 16 old cars with new motors, £6 823.

CHARING CROSS STATION.

Further Improvements on the London Underground Railways System.

APART from a few minor details, the new Underground station at Charing Cross is now complete. The station, with its three separate railways, handles over 100 000 passengers a day, which is considerably in excess of the traffic at any of the other tube stations. The various new features have been introduced piecemeal, and the result is virtually a new station capable of handling at least 50 000 000 passengers a year. The new Morden Tube, linked up with the Hampstead Line

New Booking Hall at Charing Cross Station.

by a short connecting tube, led to an additional traffic of about 26 000 passengers a day through the station exchanges, and the residents of Hendon and Edgware also made further claims upon the resources of the station, with the prospect of still further increases in traffic.

The work of reorganisation began in 1926 with the construction of a new circulating area beneath the District Railway tracks at a point where passengers could conveniently change between that railway and the Bakerloo and Hampstead Tubes below. Later came two new escalators which linked up the intermediate hall with the new south-bound platform of the Hampstead Tube. The next stage was the installation of two more escalators from the street level (Villiers Street) to the intermediate landing, making eight escalators in all. There are now no fixed stairways to negotiate.

A new booking hall, thrice as large as the old one, has been built. This has an area of 10 000 sq. ft., and it has a centre clerestory 18 ft. high and supported on massive steel columns encased with glazed terra-cotta tiles. The floor is paved with durus tiles. Automatic ticket machines are to be installed. In the new hall there will be 20 machines of the self-printing type, at which passengers will be able to help themselves. Change-giving kiosks, an inquiry office, and a special office for the issue of season tickets are additional new features. The station fronts to Villiers Street and the Embankment are floodlighted at night-time. The booking hall is illuminated by means of lamps situated outside the windows of the clerestory roof. Upon the site of the original booking office, in the Arcade, stalls are to be erected.

There is now being tried a system of coloured route signs for directing passengers. Thus, a passenger arriving by the Bakerloo and wanting Victoria will follow green lamps until he arrives at the west-bound platform of the District Railway. Similarly, a passenger arriving by the District Railway and wanting Piccadilly Circus will follow red lights to the Bakerloo north-bound platform. Or, if wanting Waterloo or Morden, he will follow dark blue lights until he arrives at the Hampstead south-bound platform. Another experiment which is being made at Charing Cross is that of employing small station names on the walls opposite the platforms.

The Minister of Transport has intimated that he is prepared to confirm Sunderland Corporation's Light Railways (Extension) Order, permitting an extension three-quarters of a mile in length, to Humbledon housing estate. The estimated cost is £20 266.

Salford Tramways Committee last week discussed proposals for establishing a Tramways and Omnibus Board, and it was decided to communicate with Eccles Corporation, and the Swinton and Pendlebury, Prestwich and Whitefield Urban District Councils on the subject. Difficulties have arisen in connection with motor-bus services in the districts mentioned, where the tramways are worked by Salford Corporation, and it is suggested that a satisfactory solution would be to combine the interests of all concerned.

ELECTRICITY SUPPLY.

Stepney Generating Station Extension—Bacup Easy Wiring System—Liverpool Electricity Department Contributes £50 000 for Rate Relief—Nelson Electricity Committee and Uniform Prices—Switchgear for Bradford.

MANCHESTER Electricity Committee has obtained sanction for a loan of £10 000 for h.t. mains.

Bury St. Edmunds T.C. has applied for a loan of £4 180 for carrying out mains extensions.

Kettering U.D.C. has arranged to give a supply of electricity to Dingley Hall, the residence of Earl Beatty.

Islington (London) Electricity Committee has voted £12 000 for further replacement of h.t. and l.t. rubber insulated mains.

Stepney (London) B.C. is seeking a Special Order in connection with a proposed extension of the Limehouse generating station.

East Ham T.C. is to seek sanction from the Electricity Commissioners to the borrowing of £2 244 for extensions of distributing mains.

Llanidloes Electric Light Co. has asked whether Llanidloes Corporation desires to acquire the company's undertaking. The matter has been referred to the Lighting Committee.

Paignton U.D.C.has agreed to the application of the Brixham Gas Co., for authority to supply electricity to premises, outside its area of supply, in Dartmouth Road and Hookhills Lane.

Ealing T.C. have approved plans for a transformer station at the works of Raines and Co., St. Mary's Road, Ealing, and also for a transformer chamber in Keats Way, for the Uxbridge and District Electric Supply Co.

Bacup Electricity Committee has put forward a scheme for the execution of wiring on the instalment plan. Customers will be required to pay an additional 1½d. per kWh up to 200 kWh per £1 of capital expenditure on wiring.

Portrush U.D.C. has approved a specification for additional plant at the electricity works, estimated to cost £2 714, and a plan for the extension of the generating station to cost £750. The Commissioners are to be asked to sanction a loan of £4 200.

Having received sanction to borrow £1 300 for new electricity transformers and switchgear, Blackpool Electricity Committee now proposes seeking sanction for £8 000 to cover expenses in connection with the hiring of wash boilers, electric cookers, etc.

The electricity supply at Armitage, Staffs, was switched on last week by the chairman of the Parish Council, Mr. Thomas Farrington. The supply has been provided by the Trent Valley and High Peak Electricity Co., who held a two days' exhibition of electrical fittings in the parish room.

Worcester Corporation has decided to instal two 500 kVA Scott connected transformer sets, to cost £825 7s. 6d.; three 200 kVA transformers, £145 10s. each; and one 100 kVA transformer, £114 12s.; and to expend £2 000, in addition to £4 600 already spent, to carry on the work of the change over from d.c. to a.c.

Gravesend Electricity Committee has decided to inform the Joint Electricity Authority that it is not prepared to enter into any agreement involving the transfer or lease of its generating station or transmission lines.—The Corporation has obtained a Fringe Order for the supply of electricity to premises in Strood rural district.

Oldham Electricity Committee has received a letter from J. Brierley and Son, on behalf of the owners of several cotton mills, etc., with reference to the possibility of a reduction in the charges for electricity supplied to them, and it has been agreed that a sub-committee meet a deputation of the firms concerned to discuss the position.

The sum of £50 000 is to be devoted by the Liverpool electricity undertaking to the relief of rates. An endeavour made at last week's Council meeting to reduce the sum to £25 000, on the ground that the undertaking could not afford more in view of its contingent absorption in the Central Electricity's Board's scheme, was defeated.

Bebington and Bromborough U.D.C. has decided to light New Chester Road and the two by-path roads at New Ferry and Bromborough by electricity at an annual cost of £1 692, equivalent to a 2·1d. rate. The number of lamp standards to be used will be 108, and current will be supplied jointly by Birkenhead Corporation and Messrs. Lever Bros.

Ald. Smithson (chairman of the Nelson Electricity Committee) recently informed the Council that the Committee thought there should be no differentiation of price for electricity, and at the end of the year they would make such arrangements that there would be no preference either to large or small, but one uniform standard under which all would be treated alike.

Wellington (Somerset) District Electricity Co., has come to the conclusion that, owing to the situation which has arisen under the Electricity Acts, it would be unwise for the company to construct a generating station at Wellington, and it is arranging a bulk supply with the Whitehall Securities Corporation. Wellington U.D.C. has decided to inform the Commissioners of its desire to get its own supply in bulk and distribute it.

Stoke-on-Trent Electricity Committee seeks sanction for loans of £720 for mains extension, Marlborough Street, Evelyn Street and Goddard Street, Fenton; £800 in connection with supply to sewage works at Ford Green; £17,000 for e.h.t. feeder from Empson Street to Greenbank Road; £10 800 for cost of change over in various districts; £6 000 for mains extensions, Church Street, Longton, and £900 for mains extensions, Barlaston Old Road, Trentham.

Bermondsey (London) Electricity Committee reports that, in view of the altered conditions for the bulk supply of electricity to the Council from the London Electricity Supply Corporation, the Borough Electrical Engineer has been in communication with the London County Council with a view to the revision of the terms for the supply of current by the Council for the purpose of the tramways. The following terms have now been accepted by London County Council: The Borough Council to supply the necessary power, on the basis of a maximum demand of 1 000 kW at about 600 V, at 0.86d. per kWh delivered to the d.c. track switchboard, based on coal at 17s. 6d. a ton, subject to adjustment in respect of variations in the cost of coal.

Mr. H. E. Annett, borough electrical engineer, Bolton, is to report upon a scheme for the hiring of separate meters for electric advertising signs, shop window lighting, or similar purposes.—The Highways Committee has been informed that the Lancashire Electric Power Co., has applied to the Minister of Transport for consent to the placing of lines above ground between Chequerbent and Chorley, to supply electricity at 33 000 V, three-phase. The committee is to make representations to the company that the poles carrying the proposed wires over and across Lostock Lane should be placed at least 120 feet apart, and as nearly as possible 60 ft. from the centre of the present road.—Supplies of electricity in the Over Hulton district are to be afforded by means of overhead lines.

Bradford Electricity Committee has approved the scheme submitted by the Engineer for the reorganisation of e.h.t. switchgear at the Valley Road power station, at a cost of £75 460, and has authorised him to obtain tenders for the works. The steam-driven feed pump at Valley Road is to be replaced by an electricallg-driven pump at an estimated cost of £220. The Engineer has reported on the lighting of streets in districts of the city which are in the areas of supply of the Pudsey Gas Co., and the Drighlington and Gildersome Gas Light Co., and the Electricity Committee has decided to instal 622 electric standards, with time switch control, in place of 500 existing gas lamps, at an estimated capital cost of £10 415. The Electricity Committee has voted £20 000 for mains extensions.

The Post Office has applied to Tynemouth electricity department for a supply of current to several telephone kiosks. The Electrical Engineer recommends that the charge for supplying current and service for a 20 W lamp, but not including the lamp, be 30s. per annum, to be reduced to 10s. if the Post Office pay the Corporation £7, the cost of the service into the kiosk.—The General Electric Co. provided and erected the lamp columns and carried out the installation work on the length of the coast road which lies in the borough. The Borough Surveyor recommends that he be authorised to enter into an agreement with the company for the carrying out of the Grand Parade lighting if equally favourable terms can be arranged. The Electricity Committee has agreed, with the proviso that in the event of such terms not being obtained the Borough Surveyor shall obtain prices from other firms.

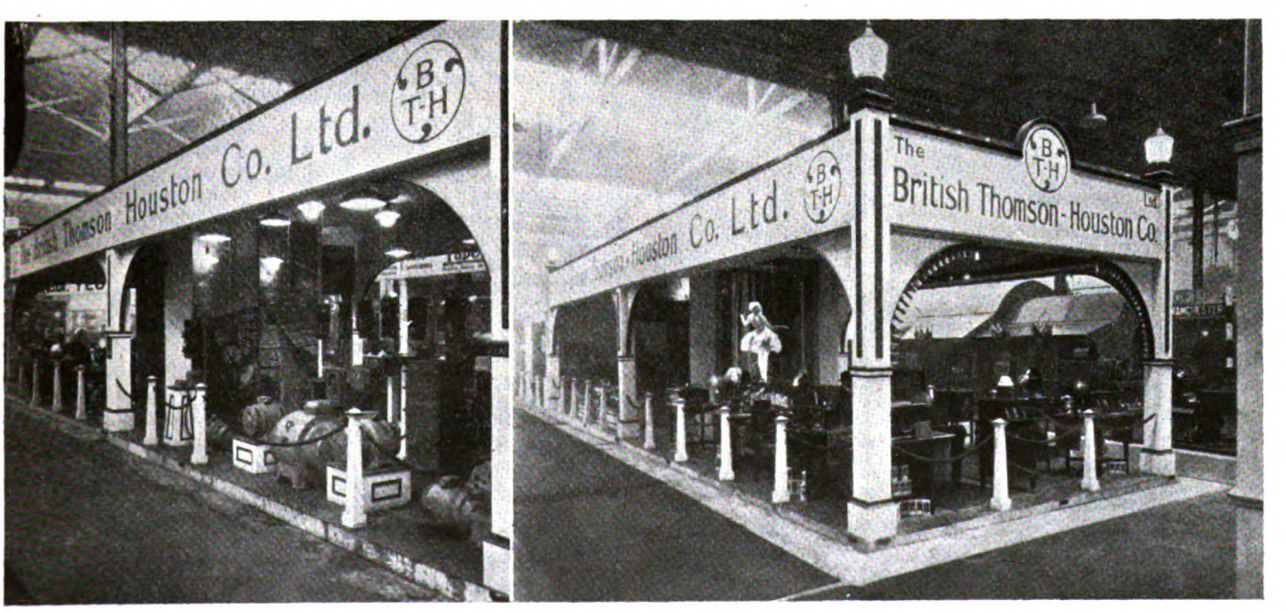
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mr. C. W. V. Schaefer, whose death was announced last week, joined the Eastern Telegraph Co. in 1884 and became electrician-in-chief in 1923.

One of the century-old water wheels at the D. P. Battery Co.'s works at Bakewell, as it appeared during the recent severe frosts.

Sir Hugo and Lady Hirst, on board the s.s. "Tamaroa," upon their arrival at Southampton on February 22nd, from Australia.

Members and guests of the Association of Supervising Electrical Engineers, at the annual dinner, on Saturday, February 23rd, at the Hotel Cecil, London. Mr. S. B. Donkin, president of the Association, was in the chair, and the guests included, among others, Lt.-Col. Kenelm Edgcumbe, Sir Brodie Henderson, and Sir Wm. Noble. A report of the speeches is given on page 274.



Two views of the stand of the British Thomson-Houston Co., Ltd., in the Electrical Section of the British Industries Fair at Castle Bromwich. The picture showing the industrial exhibits includes some of the industrial lighting scenes which were a feature of the stand. These were specially designed to show in appropriate surroundings various types of lighting units.

COMPANY NEWS.

Improved Prices of Manufacturers' Shares—Electrical Distribution of Yorkshire's Increased Profit—Utilities Power and Light Corporation's Debentures—Underground Railways' Annual Meetings—New Electrical Companies.

THE market for General Electric shares has turned again after the recent profit-taking, and a rise of half-a-crown during the past week has brought the price of the £1 share up to £3 15s. The £1 ordinary shares of Callender's Cable Co. and of W. T. Henley's Telegraph Works Company have each put on 1s. 3d., to £4 7s. 6d. and £6 1s. 3d. respectively; but British Insulateds at £4 15s. are 1s. 3d. down, and a fall of 1s. 6d. has brought down the quotation for Ever Ready shares again to 24s. County of London Supply shares have been sold, and the price has dropped from 56s. to 52s.

CLYDE VALLEY ELECTRICAL POWER CO.—Fin. div. on ord. shs. cap., 5%, makg. 8% for 1928, subject to tax.

POLPERRO ELECTRIC AND COLD STORAGE CO., LTD.—This co. recently offered for subscriptn. 5 000 shs. of £1 ea.

LIVERPOOL OVERHEAD RAILWAY CO.—Dividend for the year ended Dec. 31 at rate of 5% p.a., less tax, on pref. shs.

EVER READY CO. (GREAT BRITAIN) LTD,—An issue of 395 200 ord. shs. of 5s. ea. has been offered for subscriptn. during the past week.

ISLE OF THANET ELECTRICAL SUPPLY CO., LTD.—Div. on ord. shs. 4%, less tax, for year 1928. To gen. res. and depreciatn. £30 000.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD.—Directors recommend a blce. div. on £1 ord. shs. of 10·1811d. p. sh., makg., with intm. div., the standard div. for 1928.

ELECTRICAL DISTRIBUTION OF YORKSHIRE, LTD.—Pft. for 1928, £78 281, agst. £63 217, plus £18 723, agst. £15 837, brt. in. Div. on ord. cap. 9% less tax, of which 4½% was paid in Aug.; to res., £17 500; fwd. £21 905.

SOUTH METROPOLITAN ELECTRIC TRAMWAYS AND LIGHTING CO., LTD.—Blce. from workg. £65 783. Deductg. int., renewals, reserve, etc., leaves £26 491, plus £9 148 brt. in. Div. on cum. pref. 6% and on ord. 5%. Fwd. £11 139.

RUSHDEN AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Gross rev. for 1928, £22 906, agst. £18 845; net rev. £6 864, agst. £5 649. Written off deb. stk. disct. and exes, £401; to res. £500. Fin. div. 4½%, makg. 8% for year. Fwd. £1 250.

UTILITIES POWER AND LIGHT CORPORATION.—This co. which has acquired all the common or ord. sh. of the Greater London and Counties Trust, offered, last Friday, $36 000 000 of 35-year 5% debs., with stk. purchase warrts. at 98%. Part of the proceeds will be used to withdraw 5½% debs.

NORTHAMPTON ELECTRIC LIGHT AND POWER CO., LTD.—Gross income for past year, £173 529, agst. £161 847. Net rev. £69 183, agst. £71 858. To depreciatn. £34 342, agst. £28 988. To gen. res. £8 000; to employees' benevolent fund £2 000. Fin. div. 5% on ord. shs., makg. 9% for year. Fwd. £9 690, agst. £9 910.

SMITHFIELD MARKETS ELECTRIC SUPPLY CO., LTD.—Net pft.. after provisn. for int. on deb. stk. etc., and placing £3 000 to deb. stk. redemptn. fund, £10 778, plus £2 531 brt. in. Deductg. intm. div. paid in Aug. 1928, leaves £11 509. Div. of 5% (1s. p. sh.) proposed for half-year to Dec., 1928, makg. 8% for year; to gen. res. £6 000; fwd. £2 509.

TORQUAY TRAMWAYS CO., LTD.—Pt. for 1928 £34 521. After deductg. deb. int. and amt. transferred to sinking fund for prior lien debs., there remains £27 921, plus £1 785 brt. in. To res. and renewals £9 711, provided for income-tax £4 400, for depreciatn. £117, and sick pay and pensions £191. Fin. div. 4% and bonus of 1% both tax free, makg. 9%. Fwd. £1 783.

LONDON UNITED TRAMWAYS, LTD.—Traffic receipts for 1928, £453 447, agst. £41 231. Opratg. exes. £392 456, increase £24 670; net receipts £60 991, increase £16 564. Other income £7 492, increase £134, makg. net income £68 483, increase £16 698. Deductg. fixed charges leaves £14 589, increase £17 034, which has been applied to reducing deficit brt. in. Deficiency carried fwd. £53 431.

METROPOLITAN ELECTRIC TRAMWAYS, LTD.—Traffic receipts for 1928, £679 369, increase £41 518. Other income £146 815, increase £9 000. Operatg. exes., £661 396, increase £8 841. Net income, £164 788, increase £41 677. Deductg. fixed charges £147 511, decrease £1 070, left £17 277, increase £42 747, which has been applied to reductn. of deficit brt. in, deficiency now carried fwd. being £80 827.

LANCASHIRE UNITED TRANSPORT AND POWER CO., LTD.—Gross pft. for 1928, £82 412. Traffic receipts, £350 576, increase £29 645; electricity sold and miscellaneous receipts, £27 538. Workg. exes., £247 116, cost of generatn., £8 041; gen. charges, £16 007; rent of leased lines, £4 538. Deductg. workg. exes., int., etc., on 1st mtge. deb. stk., depreciation on motor vehicles (£26 750) and provisn. of int., at 5%, on 2nd mtge. deb. stk. for 1928, leaves £12 554, which is carried fwd.

METROPOLITAN ELECTRIC SUPPLY CO., LTD.—Gross rev. for 1928, £901 752, increase £18 818. Workg. exes. £564 136. increase £37 430. Net rev. £337 617, plus blce. brt. fwd, and int. and divs. from investmts. and allied undertakgs. makg. £480 755. After providg. for int. on deb. stks. and loans, sinkg. fund, div. on pref. shs. and other charges, there remains £222 149. Directors recommend div. at 12% p.a. on ord. shs., makg. 9% for year. Fwd. £87 149.

MIDLAND ELECTRIC SUPPLY CO., LTD.—Tradg. pfts. of undertakgs. owned and operated by co. for 1928, after paymt. of tax, amtd. to £306 510. To depreciatn. and res. of such undertakgs., £80 274. Blce. to credit of pft. and loss, includg. £4 106 brt. fwd., £217 811. Loan and deb. int., £23 605; to deb. redemptn. acct. £7 035; to investmt. res., £15 000, and intm. div. on 6% cum. pref. shs. for half year to June, 1928, £36 000. Divs. proposed: div. for half-year to Dec., 1928, on 6% cum. pref. shs., less tax, and div. of 6½% for year on ord. shs., less tax. Fwd. £5 676.

CROMPTON PARKINSON, LTD.—In order to correspond with the paymt. of the divs. on the 8% 1st pref. shs., the board in future propose to declare divs. on the 6% 2nd pref. shs. half-yearly, payable on March 31 and Sept. 30. The next half-year's div. should, therefore, be payable on Sept. 30. A half-yearly div. on the 8% cum. 1st pref. shs. at rate of 8% p.a. for six months ended Dec. 31, 1928, will be payable on March 31. A half-yearly div. on 6% cum. 2nd pref. shs. at rate of 6% p.a. for the six months ended Dec. 31, 1928, is now payable. Intm. div. on ord. shs. for six months ended Dec. 31, at rate of 22½% p.a. will be payable on March 31.

CHARING CROSS ELECTRICITY SUPPLY CO., LTD.—Gross earngs. of West End undertakgs. for 1928, £330 571, agst. £337 839; pft. £145 920, agst. £121 030. With int. and divs. accrued and amt. brt. in, total available is £238 493. Int. on deb. stk., etc., absorb £15 786, contributns. to sinking funds, etc. £40 491, and div. on pref. shs. £18 000. Fin. div. 10 1/8d. p. sh. on ord. shs. Fwd. £79 706, agst. £43 007. Gross earngs. of City undertakg. £345 939, agst. £354 527. Exes. £208 651, agst. £254 113; net earngs. £137 287, agst. £100 414. Includg. rent in respect of Bow generatg. station and trunk mains, etc. £60 943, and £1 472 brt. in, total available is £199 703. Int. on deb. stk. required £114 476, and div. on pref. shs. £18 000. Div. on ord. shs. equivalent to 10% on £350 000 and 7% on £200 000 absorbed £49 000. Fwd. £18 226.

SOUTHERN CANADA POWER CO., LTD.—A circular sent to the common shhldrs. states that at a special gnl. mtg. held on Dec. 21 last, it was the wish of all the shhldrs. present and represented by proxy to split the common shs. four for one, and to increase the cap. stk. to 500 000 common shs., and supplementary letters patent have been granted by the Secretary of State for Canada giving effect to these changes. The directors have, accordingly, authorised the Montreal Trust Co. and the Eastern Trust Co. to issue and register, in the name of hldrs. of no par value common stk. new certificates, on the basis of four shs. of new no par value stk. for each sh. of old no par value common stk. Shhldrs. are asked to send the certificates now held, with the necessary form (which accompanies the circular) filled up, to the Montreal Trust Co., 11, Place d'Armes, Montreal.

Company Meetings.

NORTH WALES POWER CO., LTD.—At an extraordinary meeting last Friday a resolution to reduce the capital from £1 000 000 to £808 058 10s. was passed.

TYNESIDE TRAMWAYS AND TRAMROADS CO.—At the recent half-yearly meeting, Mr. S. Hunter, who presided, said the deficit for the half year, after charging interest on mortgages, amounted to £2 530, which had been met by transferring £2 500 from general reserve. At a subsequent extraordinary meeting, the company's Bill in Parliament to authorise the abandonment of the tramways system and the substitution of omnibuses was approved.

MERSEY RAILWAY CO.—Mr. James Falconer, presiding at the meeting last Friday, said, after dealing with the financial figures in the report abstracted in our last issue, they had extended the cheap day tickets to passengers from all their stations, and had made them available at all hours of the day. Passengers carried during the year numbered 17 083 057, increase 68 795, and train miles were 486 085, increase 6 313, while the average number of cars per train had also been increased. The new electric pump had been satisfactory, and this had influenced them to place an order for a second electrically driven pump, the cost of which was estimated at £3 700. The report was adopted and the dividend approved.

METROPOLITAN RAILWAY CO.—Lord Aberconway presiding at the meeting on February 21st, said their gross receipts from railway working, etc., for 1928, were £1 606 966, an increase of £48 492, and expenditure was £1 116 424, increase £37 348. Other receipts amounted to £335 153, against £336 366 net. After deducting certain fixed charges, the net revenue for the year amounted to £780 612, compared with £765 866. After providing for interest on their debenture stocks and full dividend on the preference stocks, there was a balance available for dividend on the ordinary stock of £299 141, increase £35 317. In the first half of the year they paid an interim dividend at the rate of 1¼%, and they proposed now to pay a final dividend of 2¼%, making 3½% for the year, placing £10 000 to reserve, and carrying forward £23 888. Last year they paid 3%, placed a similar amount of £10 000 to the reserve fund and carried out £26 464. They were all the time modernising the electrical plant, and this enabled them to increase the output of current without raising the expenditure. At their electrical works at Neasden they had replaced another of the small 5 000 kW generating sets by an up-to-date set of 20 000 kW. The new machine had been in operation since last June, and had enabled them to effect considerable economies in coal consumption.

Distribution in London.

ST. JAMES' AND PALL MALL ELECTRIC LIGHT CO., LTD.—Mr. Gerald W. Balfour, presiding at the meeting on Tuesday, said the Board had now in operation certain static transformer sub-stations in the area, and they had in hand negotiations for the acquisition of further sites suitable for use as sub-stations. The directors were hopeful of securing sites at rentals which would still leave no doubt as to the economic value of the new system of alternating current distribution. The cost per kWh purchased from the London Power Co. fell from 0·8116d. in 1927 to 0·7944d. in 1928. Receipts from sales of electricity in 1928 were less by some £12 030 than in 1927, mainly due to two substantial reductions made in their tariffs during last year. Their output amounted to over 32 000 000 kWh against 28 000 000. Connections increased from 31 733 to 35 626 kW, equivalent to 12·27%. Their initial charge for lighting supply was from midsummer last reduced to 4d. per kWh, with a reduction to 3d. per kWh for any excess over 4 000 kWh in each year. The power charge was concurrently reduced to a flat rate of 1d. per kWh (the former fixed charge of 7s. 6d. per rated H.P. per quarter being at the same time withdrawn), and a special rate of ½d. was introduced for supply for water-heating purposes during off-peak periods. The introduction in the autumn of 1927 of a reduced rate of 2d. per unit for shop window lighting between 6 p.m. and 8 a.m. and throughout Sundays had been a phenomenal success, and many consumers who formerly failed to illuminate their shop windows after closing hours had taken full advantage of this reduced rate. They closed the year with a net profit of £103 851, against £123 933.

BAIRD TELEVISION DEVELOPMENT CO., LTD.—Sir E. Manville, presiding at the meeting last week, said that was the first annual meeting, and should have been held last autumn. Having regard to certain negotiations, the results of which it was hoped would have a material bearing on the company's policy in the future, the fixing of the date of the meeting was deferred from time to time. The progress made was remarkable, and beyond what they had expected. The images and scenes transmitted and received had attained a degree of perfection which was truly remarkable, whether transmitted over a metallic circuit or by wireless. They had already reached the stage when several figures could be seen simultaneously, and they had transmitted a small stage play. The Baird International Co. was in negotiation for the establishment of broadcasting of television on the company's system in most parts of the world, which he believed would rapidly lead to results of the utmost importance to them. Lord Ampthill, chairman of the International Co. was able to state at its statutory meeting last September that already a company to operate the Baird system had been formed in the U.S.A. in partnership with influential radio interests there. The company was installing transmitting and receiving apparatus in the chief Berlin wireless station. Some seven Continental broadcasting stations had invited the International Co. to instal transmitters for broadcasting television to the recipients of those stations. They had in course of manufacture some thousands of televisors which would be on sale to the public at moderate prices. A start was made at the commencement of the company's operations in the development of what they termed "phonovision," which, however, had

Digitized by Google

not been proceeded with, owing to the necessity of concentrating all their efforts on the development of television for commercial purposes. There were other systems covered by the patents owned by the company, such as "Noctovision" and "Facsimile-telegraphy." Developments in these had been somewhat restricted, for the same reasons, although they had reason to believe that their system of Facsimile telegraphy would prove to be the fastest and most exact system extant. Baird television apparatus was now being installed at Radio Paris. The report and accounts were adopted.

POWER SECURITIES CORPORATION, LTD.—Mr. George Balfour M.P., presiding at the meeting last week, said the gross trading profit of £123 159, compared with £111 795 for the previous year, might be regarded as a satisfactory result, bearing in mind that they had left the profits from the contracting and engineering side of the business in the accounts of Balfour Beatty and Co., Ltd. Apart from the Lochaber contract, they had completed work in the Argentine, including two power station plants totalling 45 000 H.P. and in addition had dealt with a certain amount of plant and other works for Indian and African undertakings and a large volume of mixed construction work in Britain. The Grampians hydro-electric development was commenced during the early part of the year and was making rapid progress. During the year they delivered preliminary development plant under contract with the Madras Government, the principal works, for which they had the construction rights, having been submitted to the Government for final approval. They had at present in hand other engineering and construction work aggregating about 2¼ million pounds, which was all being carried out on a secure or fixed basis of remuneration, and, in addition, they had works of considerable magnitude to be taken in hand a year or two hence. They had handled during the year public issues of securities for electric supply and allied undertakings to an amount, aggregating some £3 000 000, for seven different undertakings, in addition to advances of a temporary nature. Investments stood at £797 885, against £695 404, an increase of approximately £100 000. The investments consisted of the share capital of Balfour, Beatty and Co., Ltd., holdings in electrical undertakings, Government securities and miscellaneous industrial holdings. Loans and participations amounted to £276 489, against £177 401. Income for the year amounted, including transfer fees, to £123 159, an increase of £11 363. There had been provided for taxation £19 481, against £9 772 and the balance carried to balance-sheet was £85 239, against £84 678. Adding the sum brought in from last year, £15 631, the total amount they had to deal with was £100 869. Preference dividend for the year, less tax, absorbed £28 000, transfer to reserve account £20 000, dividend equalisation account, £10 000, leaving £42 869. Directors proposed payment of dividend on the ordinary shares for the year 1928, at the rate of 7% per annum, leaving to be carried forward £14 869. The report and accounts were adopted.

UNDERGROUND RAILWAYS.—The annual meetings of the Metropolitan District Railway, London Electric, City and South London, and Central London Railway Companies were held on February 21st. Lord Ashfield was absent through ndi sposition, and his speech (which was read) stated the number of passengers carried during 1928 was 1 803 millions, an increase of 134 millions. The gross traffic receipts amounted to almost £15 000 000, and expenditure to £12 000 000, so that the net receipts were almost £3 000 000, or, to be more exact, £2 895 000, an increase of £266 000. For the first time they had been required to include in expenditure sums which previously had been treated as reserves, and deducted at a later stage. The sums so dealt with amounted to £160 000, in round figures, and, therefore, if they were to adjust the accounts to agree with those for 1927 the increase in net receipts would have been £426 000, instead of £266 000. Miscellaneous receipts amounted to just over £1 050 000, increase £27 000, so that altogether the amount of money at their disposal at this stage was increased by £453 000, or, allowing for an increase of £108 000 in the amount carried forward from 1927, £561 000. The dividend paid on the stocks and shares of the four railway companies was to be at the rate of 5%. Upon the railways the average cost of operation per car mile has fallen nearly 5%. It was estimated that in 1928 the total number of passengers carried in Greater London amounted to 3 989 millions, and of this total the passengers carried by their companies and the other companies with which they had close associations were 2 379 millions, so that they were responsible, directly or indirectly, for not less than 60% of the total passenger movement. They had strained their financial structure to the utmost to provide London with adequate transport facilities, and now they could do no more. They were compelled now to wait and demand that their finances should be put in a sound state. The remedy which force of circumstances compelled them to devise for themselves had now become the remedy which all those who are called in to treat the ills of London traffic prescribed. A wider common fund and a broader common management were now found to be the cure for the troubles which beset the outer suburbs. The immediate needs of London were underground railways, which would connect the newer suburbs at the periphery with the centres of commerce and trade. Many proposals have been discussed at inquiries held by the London Traffic Advisory Committee, and of these the most urgent would seem to be the extension of the Piccadilly section of the London Electric Railway in a northerly direction. This was the task they set before themselves as soon as they were able to raise the requisite capital. The report and accounts were adopted, and at special general meetings subsequently held the Bills now before Parliament were approved.

New Companies.

BORDER ELECTRICAL FACTORING CO., LTD.—Cap., £5 000. Electrical factors, etc. Reg. office: Collier Lane, Carlisle.

CALEDONIAN WIRELESS COLLEGES, LTD.—Cap., £2 000. To carry on business indicated by title. Reg. office: 24, India Street, Glasgow, C.2.

DERBY ENGINEERING CO., LTD.—Cap., £1 000. Electrical and general engineers, etc. Reg. office: Victoria Chambers, St. Peter's Churchyard, Derby.

HEARD AND PARTNERS, LTD.—Cap., £8 000. Mechanical, electrical and experimental engineers, etc. Solicitors: W. H. Court and Son, 7, Grosvenor Street, London, W.1.

"LOUD SPEAKER" CO., LTD.—Cap., £200. Manufacturers of and dealers in wireless and electrical apparatus and equipment, etc. Reg. office: 38, Palmer Street, Westminster, London, S.W.1.

JUNCTION ENGINEERING CO., LTD.—Cap., £1 500. To acquire business of mechanical and electrical engineer now carried on by A. T. Smee as "Junction Engineering Co," at 149a, Junction Road N.19.

MAYFAIR ENTERPRISES, LTD.—Cap., £1 000. Manufacturers of and dealers in gramophones, wireless, electrical and other instruments and apparatus, electrical engineers, etc. Reg. office: 37, Bruton Street, London, W.1.

MAIDEN HOLDING CO. LTD.—Cap., £100. Manufacturers, vendors or purchasers of wireless, telephone and television apparatus. electricians, suppliers of electricity, etc. Solicitors: S. G. Wood, 13, Bedford Row, London, W.C.1.

FROMRAY PARENT CO., LTD.—Cap., £120. To acquire from V. C. Fromray the benefit of certain existing inventions and discoveries relating to the use of electricity, etc. Solicitors: Boyce Evans and Sheppard, 14, Stratford Place, London, W.1.

GEE JAY SUPPLIES (WHOLESALE), LTD.—Cap., £1 000. Electrical wireless and general engineers, manufacturers of and dealers in radio and telephone apparatus and supplies, wireless service agents, etc. Solicitor: C. Jones, Vron Chambers, Holywell.

WELSH MINERALS CORPORATION, LTD.—Cap., £5 000. Mine and quarry owners, reducers and precipitators by hydro-metallurgical, metallurgical, hydro-electric or other processes of metals or metallic substances, etc. Reg. office: 36, Park Place, Cardiff.

NYE AND MENZIES, LTD.—Cap., £1 000. Engineers, agents for, dealers in and manufacturers of railway and general engineering equipment, tramways, signalling apparatus, electrical and wireless apparatus, etc. Reg. office: 62, New Broad Street, London, E.C.2.

LINLEY ENGINEERING CO., LTD.—Cap., £50 000. To adopt agreement with G. C. Griffiths, B. J. W. Barry and R. T. Firminger, and to carry on business of metallurgists, electrical supply engineers, etc. Reg. office: Nechells Park Works, Eliot Street, Birmingham. (Public co.)

HARMONY, LTD.—Cap., £500. Manufacturers of and dealers in wireless receivers and instruments, drawn wire electric cabling, electric lamps, articles and things used in connection with electrical, telegraphic, telephonic and wireless appliances, etc. Reg. office: 66, Newman Street, London, W.1.

HAYNES AND FORD (STAMPERS), LTD.—Cap., £4 000. To acquire business of E. F. Haynes, Ltd., of 47, 48 and 49, Northampton Street, Birmingham, and to carry on business of makers of motor parts and fittings, wireless parts, etc. Reg. office: 47, 48 and 49, Northampton Street, Birmingham.

ROGERS-JENKINS AND CO. (PTY.), LTD.—Cap., £100 000. Incorporated in South Africa, to acquire business of a mechanical, electrical and contracting engineer carried on by A. Rogers-Jenkins as Rogers-Jenkins and Co., Durban. British address: 21, Chiswell Street, London, E.C.1, where H. F. Adams is authorised to accept service of process and notices on behalf of the company.

SIMPSON, BAKER AND CO., LTD.—Cap., £20 000. To acquire business of electrical suppliers, factors and agents carried on by C.M. Simpson and A. C. Baker, at 2–5, Nelson Street, Bristol, and at 32, Newman Street Marylebone, London, as "Simpson, Baker and Co." also to carry on business of manufacturers of and dealers in telegraphic, telephonic and wireless apparatus, etc.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

AVON ELECTRIC CO., 313, Aigburth Road, Liverpool, electricians. £16 1s. 6d. January 7th.

BURKHILL, Harold Benjamin, 11, Edleston Road, Crewe, electrical engineer. £24 1s. 3d. January 13th.

CARTER, Mr. N. E. W. (trading as CHELTENHAM ACCUMULATOR CO.), 8A, Pitville Street, Cheltenham, radio and electrical engineer. £22 5s. 10d. December 14th.

COLE, Mrs. A., 46, Barking Road, Canning Town, wireless trader. £11 17s. 8d. January 17th.

ETHERIDGE, J. L. AND CO., 6, Woolcomber Street, Dover, electrical engineers. £12 15s. 6d. January 11th.

GAMBLE AND SONS, LTD., 283, Belgrave Gate, Leicester, electrical engineers. £17 13s. 4d. December 12th.

GREEN, G. R. AND CO., 68, High Street, Evesham, electrical merchants. £13 1s. 5d. August 15th.

JACOBS, Mr. A. (trading as SHEEN ELECTRICAL CO.), 37, Sheen Road, Richmond, electrician. £12 12s. 6d. December 12th.

KNIGHT, Walter H., 51, London Road, Bromley, wireless dealer. £13 2s. 10d. November 26th.

MILWARD, Mr. R., Ystradgynleis, electrical and wireless engineers. £13 7s. 10d. December 14th.

SANDS, Mr. C. W., High Street, Kings Langley, electrical contractor. 13 18s. 7d. January 11th.

SUTTON, Mr. A., Corner House, Chase Road, Epsom, electrical contractor. £19 5s. 11d. January 9th.

TASSELL, W., AND CO., Cheltenham Parade, Harrogate, electrical engineers. £26 19s. January 14th.

TEMPEST, Mr. C., 4, Mann's Court, Kirkgate, Bradford, engineer and electrical contractor. £41 1s. 10d. January 10th.

WADDLE, Leonard, 14, Woodhom Road, Newbiggin-by-the-Sea, electrical dealer. £18 8s. 8d. January 9th.

Receiverships.

G. E. AMBATIELO AND CO., LTD. (formerly G. E. AMBATIELOS AND CO., LTD.). B. L. Clarke-Lens, of 76, Newgate Street, E.C.1, was appointed receiver and manager on February 8th, 1929, under powers contained in debenture dated July 9th, 1927.

ELECTRICAL APPLIANCES (BLACKPOOL), LTD. W. B. Haworth, 5, Bloomfield Road, Blackpool, was appointed receiver and manager on February 19th, on behalf of the debenture holders.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

MARPOLE AND FRISBY, LTD., electrical engineers, 161a Wardour Street, London, W. At the statutory meeting of the creditors in this voluntary winding-up, the liquidator, Mr. F. Stanley Wilks, submitted a statement of affairs which showed liabilities to unsecured creditors £548, £76 due to preferential creditors, and £250 to a debenture holder. The assets were estimated to realise £309. The liquidator stated that for the year to February, 1927, the returns were £4 800, and for the year to February, 1928, they were £2 313. In reply to a creditor, he said that the company had worked on a gross profit of about 10 per cent., which, of course, was altogether insufficient for a business of that kind. Profits had had to be cut, however, in order to meet competition.

London Gazette, etc.

Company Winding-up Voluntarily.

MALDON ELECTRIC WORKS, LTD.—A meeting of creditors at the offices of Davies, Gantner, Lovell and Co., Accountants, 5, Great Winchester Street, E.C.2, on March 4th, at 11 a.m. All creditors have been, or will be, paid in full.

Bankruptcy Information.

LEE, Edward Francis (trading as FRANCIS NEWTON), 340A, Kings Road, Chelsea, S.W.3, electrical engineer. First meeting, March 6th, 11.30 a.m., and public examination, April 12th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Notice of Dividend.

COLLIER, Thomas Frederick, 64, Union Street West, Oldham, Lancashire, electrician. First and final dividend, 9s. 1d. per £ payable March 6th, Official Receiver's Offices, Byrom Street, Manchester.

Notice of Intended Dividend.

WALLIS, Cyril Kenneth, 51, Mons Avenue, Bognor, Sussex, electrical engineer. Last day for receiving proofs, March 12th, Trustee, R. W. Cave, 12A, Marlborough Place, Brighton, Official Receiver.

Application for Discharge.

GREGORY, Albert Butterworth, 29, St. Albans Road, Seven Kings, Essex, wireless expert. Hearing, March 18th, 10.45 a.m., Shire Hall, Chelmsford.

Partnership Dissolved.

HYAMS, Philip, trading as THE RADIO MART, dealer in wireless and radio supplies, Bath Street, Glasgow. The business was transferred, as at February 18th, 1929, to Hector Russell and Co., Ltd., who will carry on the business at the same address.

Bankruptcy Proceedings.

LAWRENCE, Louis Haydn (trading as HENRY F. LAWRENCE), 43, Canterbury Road, Margate, electrical engineer. The debtor filed his petition on January 16th, and the statutory first meeting of his creditors was held on Friday of last week at Bankruptcy Buildings, Carey Street, W.C. His statement of affairs disclosed ranking liabilities £1 001, and net assets valued at £517. His failure was attributed to lack of working capital, heavy overhead charges, and trade depression occasioned by bad seasons. It appeared from the Official Receiver's observations that the debtor acquired knowledge of electrical engineering while serving in H.M. Army (Royal Engineers). Thereafter he was employed as an electrician at an average weekly wage of £5. In May, 1923, he commenced business on his own account as an electrical engineer at 14, Alexander Road, Margate, without capital. He commenced canvassing the district, and when he had worked up a connection he took business premises successively at Paragon Garage, Zion Place, Mill Lane, and Buenos Aires, Margate, and finally, in September, 1927, at 43, Canterbury Road, Margate. He estimated his turnover for the year immediately preceding the receiving order to have been about £1 600, but states that in consequence of heavy overhead charges there was a net loss of £200 during that period. The meeting passed a resolution for the appointment of Mr. C. S. Scarlett, I.A., 5, Cecil Square, Margate, as trustee of the estate, assisted by a committee of inspection.

METAL AND CHEMICAL PRICES.

TUESDAY, February 26th.

		Price.	Inc.	Dec.

THE LEAD MARKET.

James Forster and Co. state that at the opening on Monday last week the firm tone seen at the end of the previous week was again in evidence, prices rising 3s. 9d. for February and 2s. 6d. for forward. On Tuesday the market was steady and prices well maintained, while on Wednesday, in sympathy with the higher price in U.S.A. at 6.95 cents, values rose a further 2s. 6d. per ton. On Thursday the market was again steady, but in the afternoon on a large order, presumably for continental account, prices firmed up again, and a further 7s. 6d. was added to all positions. The contango had once more disappeared on the Mexican lead being declared absorbed.

Closing prices on February 22nd were £23 15s. for February, £23 12s. 6d. for March, £23 13s. 9d. for April, and £23 15s. for May, 16s. 3d to 13s 9d. per ton higher on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

304 551 Siemens and Halske Akt.-Ges. Telephone cables. (3/3/28.)
292 088 Soc. Anon. de Telephonie Priviee. Automatic telephone system. (11/6/27.)
292 506 Akt.-Ges Brown, Boveri et Cie. Mercury vapour rectifiers. (20/6/27.)
292 978 Siemens and Halske A.G. Electric control device for machines or apparatus for the sorting, evaluating, or calculating of statistical cards or paper strips provided with perforated symbols. (28/6/27.)
304 574 C. Spirig and Swiss Locomotive and Machine Works. Single stage electrically driven rotary compression or vacuum pumps for braking purposes on vehicles. (11/8/28.)
299 015 Siemens-Schuckertwerke A.G. Synchronising synchronous machines. (19/10/27.)
304 579 Siemens-Schuckertwerke Akt.-Ges and G. Scharowsky. Rectifying units for electric current. (14/11/27.)
304 580 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Coating metallic or non metallic bodies with osmium. (31/10/27.)
276 376 M. Compare. System of telegraphy or radio-telegraphy in combination with a typewriting machine adapted to ensure secrecy of messages. (23/8/27.)
304 618 J. Neale. Means for closing a local circuit by variations in an applied electrical current. (14/10/27.)
279 452 Siemens and Halske A.G. Device for regulating the degree of transmission in thermionic valve circuits. (19/10/26.)
304 621 Marcel-Sesame, Ltd., and F. Kerka. Electrical switches, plugs, sockets, or the like. (20/10/27.)
304 631 W. S. Smith and N. W. McLachlan. Thermionic valve negative resistance devices and the like. (20/10/27.)
304 622 W. S. Smith and N. W. McLachlan. Variable coupling devices for electric inductance coils. (20/10/27.)
304 623 A. Carpmael (I.G. Farbenindustrie Akt.-Ges.). Manufacture of liquid or solid products by gaseous reaction under the influence of silent electrical discharge. (20/10/27.)
304 629 F. Punga. Driving of alternating current generators. (22/10/27.)
304 707 J. Lyons and Co., Ltd., A. Goddard, G. Douglass, Igranic Electric Co., Ltd., and S. R. Wright. Electric remote-control apparatus. (24/10/27.)
304 709 Graham Amplion, Ltd., W. J. Rickets and N. T. Carne. Telephonic sound reproducing instruments. (25/10/27.)
304 710 W. S. Smith and N. W. McLachlan. Audio-frequency thermionic amplifiers for use in submarine and the like cable systems. (25/10/27.)
304 813 Standard Telephones and Cables, Ltd. (G. Deakin, L. Polinkowsky and W. Hatton). Automatic or semi-automatic telephone systems. (26/10/27.)
296 719 Weston Electrical Instrument Corporation. Electrical indicating instruments. (6/9/27.)
304 816 P. Krout. Electric time switches. (26/10/27.)
304 818 P. H. Waller. Electric display systems. (26/10/27.)
304 820 Automatic Telephone Manufacturing Co., Ltd., W. O. Passmore and R. Taylor. Telephone systems. (26/10/27.)
304 821 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Loud speakers. (26/10/27.)
304 824 H. G. C. Fairweather (Winchester Repeating Arms Co.). Combined ring-hanger and belt-hook for electric flashlights. (27/10/27.)
304 831 K. Wallach. Electric artificial rain making and weather regulating apparatus. (27/10/27.)

COMING EVENTS.

Friday, March 1st.

Junior Institution of Engineers.—39, Victoria Street, Westminster. Informal meeting. "Notes on the Control of Electric Lifts." By Mr. L. S. Atkinson. 7.30 *p.m.*

Saturday, March 2nd.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford on "Molecular Motions in Rarefied Gases." 3 *p.m.*

Monday, March 4th.

Royal Institution of Great Britain.—21, Albemarle Street, London. General meeting, 5 *p.m.*

Institution of Electrical Engineers (South Midland Centre).—University, Edmund Street, Birmingham. General discussion on "The Anticipation of Demand and the Economic Selection, Provision and Layout of Plant," with introductory papers by Capt. J. M. Donaldson and Mr. J. G. Hines. 7 *p.m.*

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Variable-Speed Alternating-Current Motors." Opened by Mr. L. J. Hunt. 7 *p.m.*

Tuesday, March 5th.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting.

University of London.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Lecture V (Course of five lectures) on "High Voltage Cables." By Mr. L. Emanueli. 5.30 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Engineers' Club, 17, Albert Square, Manchester. Paper by Messrs. E. B. Wedmore, W. B. Whitney, and C. E. R. Bruce on "An Introduction to Researches on Circuit Breaking." 7 *p.m.*

Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Illustrated lecture on "Television," by Mr. H. A. Hankey. 7.15 *p.m.*

Wednesday, March 6th.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Sub-Branch).—Ordinary meeting. 2.30 *p.m.*

Electrical Association for Women.—46, Kensington Court, London. Social Sub-Committee "At Home." 3 *p.m.*

Institution of Electrical Engineers (Wireless Section).—Savoy Place, Victoria Embankment, London. Paper by Capt. P. P. Eckersley and Mr. A. B. Howe on "Single Wave-Length Working." 6 *p.m.*

Thursday, March 7th.

Institution of Mechanical Engineers (Glasgow Branch).—Paper by Mr. J. G. Weir on "Modern Feed-Water Circuits."

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting. 11 *a.m.*

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting. 3.15 *p.m.*

Institution of Electrical Engineers (Irish Centre).—Physical Laboratory, Trinity College, Dublin. Lecture by Mr. E. S. Ritter on "Picture Telegraphy." 7.45 *p.m.*

Friday, March 8th.

Birmingham Electric Club.—Grand Hotel. Annual Dinner.

Ex-British Westinghouse Association.—Hotel Cecil, Strand, London. Annual dinner and reunion.

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, Westminster. Informal meeting. Display of a collection of recent industrial cinematograph films of engineering subjects, including one on "Electro-Farming," by Mr. R. Borlase Matthews. 7 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, Westminster. Chairman's address on "Road Transport." 7.30 *p.m.*

Saturday, March 9th.

Institution of Electrical Engineers (London Students' Section).—Visit to works of Marconi's Wireless Telegraph Co., Chelmsford. 2.15 *p.m.*

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford on "Molecular Motions in Rarefied Gases." 3 *p.m.*

Transatlantic Broadcasting.

THE American expression "tell the world" was almost put into effect on Monday, when the ceremony of swearing in Mr. HERBERT HOOVER as President of the United States was relayed from 2LO with moderate success. To the best of our knowledge this was the second nearest approach to a daylight relay of an American transmission ever attempted by the B.B.C., and though at the time of the broadcast the daylight in this country had almost disappeared, the conditions prevailing over the greater part of the Atlantic were daylight proper. As far as we have been able to ascertain, the attempt was only partially successful, in that fading and atmospherics destroyed the continuity of the announcements and speeches, but, notwithstanding these admitted interruptions, we feel that the B.B.C. engineers are to be congratulated on their endeavours. When the first American relays were made, usually at an hour round about midnight, the public listened to a series of atmospheric disturbances accompanied by a few bars of music from a jazz band, and acclaimed the performances as wonderful. Since then, American relays have been made at earlier hours, and the programmes have been comparatively clear, with the result that the public has been taught to expect good reception whenever such relays are made. Monday's results were not up to expectation but were nevertheless commendable in view of the hour and subject. To broadcast by wireless an open-air public address is at all times difficult, but when that transmission is relayed by a station 3 000 odd miles away with even moderate success, it shows that the progress made in wireless telephony as a whole is deserving of some praise. The only regret is that the listener has become so used to hearing an unblemished and uninterrupted programme, that he is inclined to look upon unsuccessful experiments at relaying as altogether ridiculous and a discredit to the B.B.C. On the contrary, without such experiments, relaying a foreign station would not be possible. We have already heard Australian transmissions, most of the large Continental stations, and now the Canadian Royal Commission, which is considering the position of broadcasting in the Dominion, is hopeful that by the time a chain of powerful stations is built across Canada, it will be possible to arrange a regular weekly programme of British broadcasting for Canadian listeners and *vice versa*.

Dual Transmission by Radio.

IN connection with the views expressed above, we note with interest that MARCONI'S WIRELESS TELEGRAPH CO., LTD., claim to have evolved a system of wireless telephony which may be operated simultaneously with wireless telegraphy on the same wavelength without frequency interference or heterodyne. The first tests of the system were made over the Canadian "beam," speech being transmitted in both directions during the normal working of the telegraph service. If the expectations of this system are realised a direct wireless telephone service between this country and the Dominions will be possible by means of existing stations. The economical advantages of the system are obvious, and since negotiations are already proceeding between this country and the Dominions for the establishment of wireless telephone services, the development of this new system may possibly change the whole aspect of communication by this means. We understand that previous experiments carried out over a period of about twelve months had been confined to speaking from Montreal to England, but now the reverse direction has been tried, with complete success. If such services with the Dominions can be operated practically, the Empire chain of communication, to say nothing of broadcasting, is nearer completion than most of us realise. The radio branch of electrical engineering appears lately to have had more than its share of the limelight, for what with facsimile transmission, broadcast relays of American programmes and so on, the daily newspapers have had plenty of good "copy." Such publicity is not only deserved, but it encourages engineers on that side of electrical research to seek even further possibilities, and though perhaps more physical in its requirements, radio engineering attracts a large percentage of the students of our electrical engineering schools and colleges, thus tending to even lower the percentage of unemployed electricals.

A Debt-free Supply.

MUNICIPAL electrical engineers will learn with interest of the decision of the Hampstead (London) Borough Council to pay off all the outstanding loans on its electricity supply undertaking, to the extent of £32 310, out of accumulated surplus, thus leaving the undertaking free from debt as from March 31st. By this move the enterprise will, it is believed, place itself in a position which is unique in the electricity supply industry. We understand that the Rugby U.D.C. Electricity Department is also practically free from debt, but its position is somewhat different from

Digitized by Google

that of Hampstead, as Rugby has never had any generating plant of its own. The Hampstead position is certainly an enviable one, and possibly some other undertakings will seek to equal its achievement. As a means of utilising surpluses it is certainly preferable to the illogical and unreasonable policy of rate relief. Lest it be thought that Hampstead is making too much money it may be stated that the tariff is one of the lowest in the country, at 3d. per kWh for lighting and 3d. for power, heating and cooking.

Back to the Cable?

As if in contrast to the developments of radio the AMERICAN TELEPHONE AND TELEGRAPH CO. announced in its annual report last week, that it would spend £400 000 000 in the next five years on the extension of plant, facilities, and perfection of a transatlantic telephone cable. While the company is developing radio telephone services on a large scale between the United States and the Argentine it claims to have already devised an effective telephone cable for transatlantic use, a necessity which, it is stated, has come about by the tremendous growth in continent-to-continent calls overloading the present radio facilities. This proposal brings to light the popularity of the radio telephone service now conducted, and though the laying of an efficient cable would relieve Rugby to some extent, the relief would not be permanent. The cable would, however, have the advantage, we imagine, of giving a full day service, whereas Rugby is restricted by the well-known day and night phenomena associated with radio. The British Post Office has already expressed a willingness to co-operate with the American Company in the event of a cable being laid, and though one may at first look to radio for a solution of the world's communication problems, it is by no means unreasonable to postulate that the solution may be found in a radio-cable service.

Best—Not Better.

WE so frequently have to refer to the species of inferiority complex with which some members of the electrical industry are infected that it is refreshing to be able to draw attention to others who maintain a more enthusiastic outlook, sometimes in spite of early disappointments. So many electrical people say in a very dogmatic way that electric cooking with energy at more than 1d. per kWh is out of the question. One morning this week we heard from an electrical enthusiast—not connected with the industry, and not particularly wealthy—that he finds that electric cooking, with the unit costing 2d., is, in every way, a most satisfactory proposition and would not go back to other methods if the cost of electricity were doubled! Prompted by the disseminators of a rival commodity we are too apt to confine our sales' arguments—and even our own private thoughts—to cost, to the exclusion of all the inestimable advantages of the electrical method, which if properly emphasised, would rapidly accelerate the progress of domestic electrification. In this connection the Coué ism, "Electricity is not better—it is best," printed on the letter heading of a London firm of electrical installation contractors, Messrs. MORTIMER AND GALL, is well worth memorising.

Training in Foremanship.

IT is acknowledged as good business to train lads carefully in the technique of their craft, but it is not always realised that training in the duties and responsibilities of a foreman is equally good. Those employers who have not yet recognised the importance of the matter will derive useful knowledge from a report, which has been issued by the Association for Education in Industry and Commerce, on the Education for Foremanship. This report emphasises three main avenues of approach. Thus, lectures may be given with special regard to the requirements of foremen of long standing; other lectures, on somewhat different lines, and possibly more specialised, should assist the newly appointed foreman; while a third course might suit more especially the charge hand or under-foreman, or the man qualifying for promotion. The courses would, however, be complementary rather than altogether distinct. The subjects treated would be grouped broadly under two main heads, the one general, without definite relationship to the vocational aspects of the question; the other directly bearing upon the career. Economics, industrial history, and psychology, etc., would figure among the former; the principles of scientific management, of planning, and of statistics; the relations between the laboratories and the engineering departments and the works; wage systems, costs and sales, factory layouts, education and training, health and fatigue, and the like, would come into the directly vocational curriculum. Wisely undertaken and directed, vocational training for foremen is essentially sane and practical politics. It should prove to be a profitable proposition for employers and employed alike.

British Engineer Honoured.

IT is with some pride that we record the announcement that the American Institute of Electrical Engineers has decided to make the first award of the Lamme Medal to an engineer of British birth and training. The recipient of this award is Mr. A. B. FIELD, who has been associated for some years past in the capacity of consulting engineer with the METROPOLITAN-VICKERS ELECTRICAL CO., and though the work for which the distinction is conferred—"the mathematical and experimental investigation of eddy current losses in large slot wound conductors"—is well known to designers of large electrical machinery, it is probably not so familiar to engineers in other sections of the industry. It may, therefore, be of interest to recall that the investigation, the results of which were embodied in a paper presented to the A.I.E.E. in 1905, constituted the first thorough analysis of the subject, and provided for the first time a system by means of which the eddy current losses for any given design of large machine could be predetermined. The importance and completeness of the work are indicated by the fact that the system, to which little seems to have been added by later investigators, still remains the acknowledged basis for the calculation of eddy current losses in turbo-alternators and other machines, notwithstanding the ever increasing capacities of the units now being built.

Television Progress.

THE Television Society is to be congratulated upon the comprehensiveness of its first exhibition, which was held at the Engineers' Club, London, on Tuesday. The exhibits covered practically every phase of the science, and indicated in a very practical way the progress which has been made. Though perhaps most of us are inclined to look upon television as being a comparatively recent invention, it was a surprise to some to find among the exhibits apparatus developed some 47 years ago, which gave much the same results as are at present obtained, without the modern improvements brought about by valve amplifiers, etc. A still greater surprise, perhaps, was to be found in the fact that the designer of this early television equipment was no less a personage than Mr. LL. B. ATKINSON who, standing beside his exhibits, gave an altogether delightful explanation of the purpose of his apparatus, and demonstrated its use. The holding of a television exhibition this week is particularly appropriate, for the Post Office last week witnessed a demonstration of a commercial system, the results of which are now under consideration. Among those seen at the exhibition was Mr. J. L. BAIRD, whose system, now operated by a limited company, is claimed to have progressed so favourably that images and scenes transmitted and received have attained a degree of perfection which is truly remarkable, whether transmitted over a metallic circuit or by wireless. Whether or not we could agree with this conclusion we cannot say, for we have never yet been permitted to witness a satisfactory demonstration. We can say, however, that the exhibition was most interesting and the claims of the exhibitors reasonable, while every facility for investigation was offered.

PERMANENT MAGNET MOVING COIL AMMETERS AND VOLTMETERS.

Synopsis of a Detailed Report of an Investigation undertaken by the B.S.I.R.A. on "Critical Examination of Characteristics of British and Foreign Permanent Magnet Moving Coil Instruments of Switchboard Pattern."

(*Concluded from page 159.*)

IN all the instruments, both British and foreign, phosphor-bronze springs were used. The alloy used for the springs in the ammeters consisted usually of copper containing about 0·7% of tin and a trace of phosphorus. For the voltmeter springs the proportion of tin was considerably higher, usually between 4% and 6%, with an accompanying increase of the amount of phosphorus present. In one ammeter the springs were made from phosphor-bronze which contained about 1·3% of tin, while in another ammeter the phosphor-bronze used was of the type generally used for the voltmeter springs.

All the instruments were tested to see if the zero changed temporarily or permanently after the coil had been kept deflected to about 90% of the maximum deflection possible, for periods up to 72 hours. In only two instruments was the zero unchanged after this period, though in practically every instance the change of zero was only temporary, the pointer coming back to its original zero after a period ranging from a few minutes to about 24 hours.

Duplicate instruments similar to those which had shown no zero change were tested in a similar manner in order to find out whether the springs used by the manufacturers of these particular instruments were commonly free from tendency to take up a sub-permanent set. The second instruments, however, showed an appreciable sub-permanent set after the test, so that the perfection of the first instruments, as regards permanence of zero, would appear to have been accidental. The examination of the instruments for zero change would appear to indicate that the problem of making springs free from the defect in question has not yet been solved by any of the manufacturers, British or foreign, whose instruments were examined.

The springs fitted in the different instruments differed greatly in the thickness, width and length, and also in the torque exerted for an increase in curvature equivalent to a movement of one radian between the ends of the spring. The variation in the stiffness of the control springs fitted in the different instruments was not related in any regular manner to the variation in the weight of the moving system. As a result, the "torque/weight" quotient varied very considerably, ranging between 0·044 and 0·46.

Magnetic System.

The degree of care taken by different manufacturers in the fit and finish of the components of the magnetic circuit varies very considerably; the air gaps in the different instruments also differ considerably in length. In most of the instruments the pole-pieces were mounted on a casting, or frame, which fixed them in their appropriate positions relative to each other. Usually the magnets fitted the pole-pieces fairly tightly, but in several instances the fit was so loose that the magnet had to be strained inwards in order to bring its two sides into contact with the backs of the pole-pieces. In one pair of instruments the magnet was not only too wide to fit the pole-pieces without considerable strain, but in addition the pole-pieces were badly surfaced on their back faces: it may be merely a coincidence that this instrument read 9·25% low. In certain other instruments in which the magnet fitted the pole-pieces somewhat loosely, thin strips of soft iron were packed between the pole-pieces and the magnets. In one pair of instruments the practice followed appeared to be to make the gap between the ends of the magnet an almost perfect fit on the backs of the pole-pieces, the fit being so perfect that the use of bolts or of any clamping device to fix the magnet on to the pole-pieces could be dispensed with. It is not suggested that the absence of bolts or other clamping device is to be recommended, but the closeness of fit which allows of dispensing with such devices is certainly desirable as compared with the type of fit found in many of the instruments. The magnets used differed largely in weight, in cross section and in length, though the variations in length were not very pronounced: the magnet steels also differed considerably in their "coercive force."

In assessing the relative merits of the magnetic systems of the different instruments, regard must be had to all the characteristics of the magnetic circuit and of the materials constituting that circuit, to the relation between the total reluctance of the circuit and the total magneto-motive force in the circuit and so on. The weight of the magnet steel used, in relation to the total flux in the air gap, should also be considered, as it affords, other things being equal, a measure of the "magnetic efficiency" of the magnetic system. In this connection it may be mentioned that, of the instruments of normal design, those with the longest and shortest air gaps respectively had gap fields which differed by less than 10% *despite the fact that the magnet in the instruments with the long air gap weighed only half as much as the magnet in the other instrument*: the heavier magnet was 20% longer than the lighter magnet.

Examination of the magnetic systems used in these instruments showed how this could be explained, the coercive force of the steel which was used in the instrument having the large air gap being some 30% higher than that of the magnet in the instrument which had the short air gap and, in addition, the design of the system was such as to minimise the magnetic leakage round and over the gap.

It will be seen, therefore, that an instrument cannot be adversely criticised merely because it has a somewhat large air gap. An instrument with a large air gap is not inferior on that account to an instrument with a smaller gap, provided the proper relation is held between the magneto-motive force of the magnet and the reluctance of the magnetic circuit, and provided that the construction of the magnetic system is such as to avoid unnecessary magnetic leakage. The larger gap has distinct advantages in some respects, not the least important of which is that it greatly reduces the danger of the coil "sticking" if a particle of magnetic dust happens to get into the gap.

Pole-Pieces.

The pole-pieces used in most of the instruments were of soft iron, though in a small number they were made of cast iron. Provided the cast iron is uniform and is free from blowholes, there would appear to be no great objection to the use of this material, though lack of uniformity might possibly cause variations in the intensity of the field in the air gap, which would be objectionable.

Some of the instruments were open to serious criticism as regards the way in which the pole-pieces were supported. Whether the movement is mounted in bridge-pieces fixed to the two pole-pieces, or is mounted in a separate self-contained frame or casting, the pole-pieces should be mounted in such a way that no strain can be imposed on the movement by the means provided for fixing the pole-pieces in position.

Such strain is not likely to arise if the movement is carried by a frame or casting which can be removed from the instrument without dismantling and without disturbing the pole-pieces.

If the movement is carried by bridge-pieces mounted on the pole-pieces, the strain will be slight if the various components fit each other accurately, but in some of the instruments the fitting of the components was so bad that the strain thrown on the movement during assembly must have been quite considerable.

The movements of most of the British instruments and also of the foreign instruments were mounted in separate frames or castings so as to be independent of the mode of fixing the pole-pieces.

Magnetic Shielding.

The instruments were not tested in any way to determine the extent to which their indications were affected by external magnetic fields. Inspection of the instruments indicated, however, that the degree of protection afforded by the instrument cases, against disturbances due to external fields, would vary considerably as between the different instruments.

About half of the instruments were fitted with cast iron cases, which, except for the opening over the scale, surrounded the instrument completely. All the instruments included in this group were of British or American origin. In general, these cast iron cases were sufficiently thick to provide reason-

Digitized by Google

able magnetic shielding, though some of the openings provided for reading the scale were unnecessarily wide.

Pressed iron cases which totally enclosed the instrument except for the scale opening, were used in one set of instruments, while in another set the cylindrical part of the case was of pressed iron with a thin cast iron disc front; both these sets were made by British manufacturers. The case made of pressed iron throughout was of stout iron, and in all probability afforded a magnetic shielding quite as effective as that provided by the more usual cast iron cases. In the other set of instruments the cylindrical part of the case was very thin and light, and gave the impression that it would afford a less effective shielding than that given by the cast iron cases.

The Continental instruments examined were not so completely shielded as the British and American instruments. All except one set were fitted with thin pressed iron cases with full glass fronts, and, where metal plates were provided behind the glass, these plates were of non-magnetic material.

The cases fitted to one of the sets of Continental instruments were made of brass, with full glass fronts, no attempt having been made to protect the instrument against disturbances due to external fields.

External Appearance.

Opinions as to the type of case and type of finish most suitable for a switchboard instrument must necessarily vary very widely. It will perhaps be generally agreed that these instruments should be finished in such a way that the position of an instrument can readily be "picked up" on a switchboard, and that when this has been done there should be little or nothing to attract the eye on the instrument itself except the scale and the pointer.

Experience gained during the examination of the instruments has led definitely to a conclusion which favours a type of finish almost severely plain, the only relief being such as that which would be afforded by a thin raised rim, either nickel-plated or black, the rest of the body having either a plain or unobtrusive matt ground, finished dead black or semi-dead black.

The majority, though not all, of the British instruments examined were finished in styles corresponding to that for which preference has just been expressed, and while certain foreign instruments were finished in a similar manner, there were several which had full white dials and some which had bright lacquered brass cases as well.

Scales.

When the instruments were first put into use no definite preference could be expressed for any particular type of scale, though certain scales were selected at once as being graduated in a manner which was considered to be objectionable. As the examination of the instruments proceeded, however, it was found possible to select certain of the scales as being easier to read and less fatiguing than some of the others. This was traced down to there being in these scales a certain balance between the thickness of the graduations and their height, in relation to their spacing. If the graduations are too thick or too long in proportion to their spacing, the resulting "palisade" effect can be very trying to the eyes.

The types of scales which were considered to be the most satisfactory were fitted in certain of the British instruments; the makers of these instruments had evidently taken great pains to select a type of scale and a style and size of figure which would give clear and ready readings. In two pairs of foreign instruments the scales were fairly satisfactory, though the figures in most of the foreign instruments were much less readily recognised than those in the British instruments just mentioned.

Pointers.

The pointer-heads varied in shape from that of a narrow spearhead to a pear-shape, some of the heads having circular holes punched in the middle. In some instances the end of the pointer projected too far, so that its fine point was almost beyond the top of the scale divisions, and the head was so broad at a little distance back from the extreme point that the scale division over which it happened to lie was entirely hidden. In some instruments also the figures of the scale were printed below the divisions, so that if the reading of the instrument was in the neighbourhood of a figure, the figure was completely covered by the pointer head. The best type of pointer for accuracy of reading was one of a modified diamond shape, all four sides of the diamond being concave with the "reading" end of the pointer head very long and finely tapering, the extreme end being about the same width as the graduations of the scale.

The type of pointer selected as the most satisfactory was still preferred when the different pointers were used with different scales; the diamond-headed pointer just mentioned was fitted in one of the foreign instruments.

Construction and Finish of Dials.

The dials were all graduated in black lines on a white background. In one or two instances the white background was provided by painting the surface of a metal plate with a flat white paint, the graduations being ruled on this painted surface. In most of the instruments, however, the background consisted of a sheet of thick white paper or card supported on a metal back. The painted scales had a slightly grey appearance when compared with the whitest of the paper or card scales, though many of the card scales were distinctly yellow and compared unfavourably with the painted scales.

Provided that the paint adheres properly to the metal plate and does not become discoloured or detached when the instrument is in service, the use of a painted dial would appear to be preferable to the fitting of a paper dial cemented to a metal back, though the whiter colour which can be obtained on a first quality card is a point in favour of the use of card instead of painted metal.

The best finished dials were found in the instruments made by certain British manufacturers, and there is certainly no evidence of inferiority of the British instruments in this respect.

General Statement.

There are many difficulties in the way of preparing any statement as to the general superiority of one electrical instrument over another. From the point of view of the user an instrument should be reasonably accurate and should give satisfactory service over a long period, and, while such features as sensitivity and appearance are desirable, they are comparatively unimportant. An electrical engineer with a good knowledge of the principles of design will, however, consider many other properties of an instrument in endeavouring to appraise such instruments properly, and according to the "weight" given to certain characteristics of the instrument, so different engineers would express preferences for different instruments. It might be that one engineer would consider it important to have an instrument with a high "torque/weight" quotient, another would express preference for an instrument of the highest sensitivity obtainable, while a third might consider robustness of the moving parts, with provision against damage due to vibration, as being of the highest importance, and so on.

The degree to which any particular characteristic should be developed in the design of an instrument is a matter on which opinions differ, and any attempt to draw up a specification giving limits between which the characteristics should lie would lead to much argument. For example, it is held by some designers that a high "torque/weight" quotient is of great importance, as it tends, among other things, to minimise friction errors. Against this there is the evidence of tests, carried out by Drysdale and Jolly, on a number of different makes of instruments of the type under consideration, in which the percentage friction errors of the instruments tested showed no relation to the weights of the movements or to the values of the "torque/weight" quotients. See "Electrical Measuring Instruments," pp. 256-257, Drysdale and Jolly.

The most that can be said here, on this matter, is that a proper balance should be held throughout the design, so that if particular attention is paid to any one characteristic the development of this characteristic should not be pursued to such an extent as will cause other characteristics of the instrument to be in defect. Conversely, also, if any characteristic is allowed to be in defect as compared with other instruments used for similar purposes, this must be compensated either by excellence of workmanship or in some other way, so that it does not impair the performance of the instrument as a whole.

It would be possible, for example, to obtain a high "torque/weight" quotient in many ways, some of which might, if carried too far, involve reducing the sensitivity to an extent which would be undesirable, while others might result in an undesirable flimsiness of the movement. On the other hand, if the movement is made fairly heavy and the instrument has a comparatively low "torque/weight" quotient, particular

Digitized by Google

attention must be paid to other details, such as the pivots and jewels, to ensure that the friction error is kept down to an appropriately low value.

The results of the examination can be summed up fairly completely as follows :—

(*a*) The best of the instruments examined, both British and foreign, are generally well suited to the purposes they are intended to serve, and none among them shows an outstanding superiority over all the others in every particular.

Two pairs of instruments of British manufacture were open to criticism in respect of certain details of construction, while two pairs of instruments of foreign origin were distinctly inferior, both in design and construction, to any of the other instruments examined.

(*b*) If the instruments are placed in order of merit as assessed on some particular criterion of excellence (e.g. efficiency of design, legibility, probable durability as judged by stiffness of construction, freedom from liability to damage due to mechanical vibration or shock, immunity from disturbance due to variation of temperature, degree of magnetic shielding provided, external appearance, etc.), the instrument placed first would in many instances be a British one ; certain of the British instruments examined would occupy high positions whatever criterion were chosen.

(*c*) The consistently high positions occupied by certain British instruments, when the instruments are judged in the manner described, has led us to the definite conclusion that the best-known British instruments of the kind dealt with are quite equal to the best-known corresponding products of foreign origin, in the suitability of their design for the purpose to be served, in the consistency of their indications, and in the general lines and details of their construction.

BOOK REVIEWS.

Every Inventor His Own Patent Agent. By W. H. Barraclough. (London : Effingham Wilson). Pp. 418. 20s. net.

This book, written by an experienced patent agent, shows in a very clear and simple manner how an ordinary inventor, unversed in the procedure, may procure his own patents without professional assistance, and at the cost of the Government fee alone. It covers, in addition to British patents, the question of foreign and Dominions patents. Infringements are thoroughly dealt with, and, besides stating what protection a British patent gives, it tells what may be patented and what may not be patented.

A particularly valuable feature of the work is the very complete classification and indexing of each subject. As a handy book of reference for the ordinary inventor desirous of securing his own patent without unnecessary waste of time and money the book should prove invaluable.

C. L. A.

Science for You. By J. G. Crowther. (London : George Routledge and Sons). Pp. 241. 5s. net.

The formerly almost impassable gulf between the scientific man and the ordinary member of the public is rapidly being bridged now that science is denuding itself of the snobbery which regarded lay interest in its doings as an impertinence. Under the guidance of such gifted interpreters as Sir Oliver Lodge and Prof. Andrade, the layman is getting a rudimentary knowledge of science which it is realised can only be to the good of teacher and pupil. Of books dealing with scientific subjects in a popular way, there are all too few. One is, therefore, inclined to welcome Mr. Crowther's attempt in the present volume to deal in a series of essays with such things as thunderstorms, stars, electric lamps, ultra-violet rays, atmospherics, and other subjects in which there have been recent advances and discoveries. But, as many capable scientists have discovered, popular exposition is a most difficult art ; and it is one in which Mr. Crowther cannot be said to excel. His chapter headings lead one to expect something unusual ; "Supers and Ultras" deals with super-magnetic fields, ultra-violet radiation, etc. ; "Plain and Spotted" is the title of a section dealing with colloids ; and a discourse on thin films is alluringly titled "Diaphaneity." Apart from quite a number of mis-statements, such as "with artificial lighting the illumination is never more than a few foot-candles" and clichés of which "mining is the most industrial of industries" is a fair sample, the phraseology is hardly calculated to convey much to the ordinary layman. A few examples will show how *not* to write "popular" science : "It is a generator of a single-phase type in which the field rotates and the coils are at rest....Since the current generated is alternating, its strength must be at zero at the moment when it changes its direction" ; "the magnetic field inside the atom is about 7 000 000 gauss." The book, nevertheless, represents an attempt to provide something of which there is a real need, and if it inspires a qualified reader to the writing of science for the masses, it will not have been written in vain.

H. G.

Underground Cable Systems. By G. Stubbings. (London : Chapman and Hall.) Pp. 215. 15s. net.

This book, while not pretending to be so comprehensive as those of Beaver or Dick and Fernie (it only includes 215 pages) will be useful to mains engineers and others who desire to have in brief form a fairly up-to-date general survey of the subject.

The number of papers, descriptive of research work and inventive developments, which has been presented on the subject of underground cable systems, before technical societies, is very large, and any work which seeks to collect together and summarise these researches and descriptions is to be welcomed. On this ground, Chapters XI and XII, the former dealing with "cables for extra high pressures" and the latter dealing with "automatic protective systems," are to be considered as distinctly useful—particularly the former—in which the author has shown considerable capacity in interpreting and condensing present-day knowledge.

This Chapter (XI) as well as Chapter XII, might well have been doubled in size—in fact Chapter XII is too sketchy.

Chapter X, on the localisation of faults, might also with advantage have been greatly amplified.

The author apologises, in the preface, for the shortness of Chapter VI, dealing with cable networks, and we must leave it at that. His section on the treatment of network impedances is quite good, and should be amplified.

It is unfortunate that on page 67, which contains an otherwise quite useful analysis of the relative merits of single-phase, two-phase and three-phase systems, treated in a more practical way than the average text book arrangement, there occurs a slip which may turn away engineers who refer to it, as giving obviously incorrect information. We understand, however, that the author is reconsidering this matter, and will no doubt straighten out the difficulty to purchasers of the book by the issue of an errata slip.

Both in connection with Chapter VI and Chapter XII, a lot of valuable work would have been done if the author had described the transitions through which both England and the United States have gone, and the reasons for the different lines taken up by them.

The chapter on the physical constants of cables, is quite sound as far as it goes ; but is, again, all too brief.

Still, as remarked at the beginning of this review, the book will fill a want, because, although all too brief on certain points, it attempts to give a general resumé on most of the topics covered by the title, and in one or two cases the detailed treatment is very good.

A. M. Taylor.

Alternating Current Power Measurement. By G. F. Tagg. (London : Sir Isaac Pitman and Sons.) Pp. viii+65. 3s. 6d. net.

Generally speaking, the measurement of power in alternating current circuits is a complicated problem. The author, has, however, shown in a very simple manner, how these measurements can be made by means of watt meters. The various methods of connection and the reasons for them have been carefully dealt with. Firstly an explanation is given of the meaning of both power and power factors, this being followed by a brief outline of the power in single, two and three-phase systems. A general theory of watt meters, given in the third chapter will be found both useful and interesting. Chapters 4 to 8 inclusive, deal successively with the measurement of power in single and two-phase ; three-phase balanced load ; three-phase, three-wire unbalanced load ; three-phase four wire unbalanced load circuits, and the summation of power in two or more circuits fed from the same supply. Power factor meters and the theory of instrument transformers are briefly described in the two final chapters.

Apart from one or two slight errors, the book is well written, and should prove a useful addition to the library, not only of the student, but also of the test room assistant.

METALS FOR E.H.T. LINE CONDUCTORS.

The Conductor Materials Compared—The New Cellular Copper Cable—Influence of Climate on Choice of Metals—Corrosion Problems with Galvanised Conductors.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

FOR a 220 000 V transmission line it is customary to consider a conductor of 1·0 in. overall diameter. In this country we have already settled on a diameter of a little over 0·75 in. overall, for the 132 000 V national "grid."

Of the different commercial metals to use for these types of overhead electric power lines we may select several that can at the present time be classed as the best conductor materials.

These are: (1) all copper; (2) all cadmium copper; (3) copper or cadmium copper for the conducting part of the strand and aluminium-bronze for reinforcing where additional strength is required; (4) all aluminium; (5) aluminium for the conducting part of the strand and galvanised steel for reinforcing where additional strength is required; (6) copper-weld copper; and (7) aluminium-bronze.

The last named composite metal is considered because of its resistance to corrosion, its high tensile strength, and its resistance to fatigue, all of which are excellent advantages. In its manufacture, it can be drawn to a tensile strength of 60 tons per sq. in.; it is more expensive than galvanised steel, but it is a better and safer metal than steel.

With reference to cadmium copper, this is based on a standard alloy giving 90 % of the conductivity of pure copper; the tensile strength is about 40 tons per sq. in., hence we have a high strength conductor with but a few per cent. less conductivity than commercial copper.

In the practice of to-day we have copper-weld wires and copper-coated steel wires. And, in recent times, we have had in use two distinct types of steel-core conductors, namely, the steel-cored aluminium and the steel-cored copper. The latter is made up of a steel core (copper-coated or copper-weld where desirable) with two layers of copper wires, the layers of copper wires being reversed over each other in such a manner as to give the best electrical properties. For many years the copper-weld copper conductor has been in successful use in overhead construction.

There are also two *hollow* type copper conductors. One of these is made up of a copper "I" beam section twisted around its longitudinal axis with a pitch of about 4 in., thus giving adjacent bearing points 2 in. apart along the axis of the cable, and about 1⅛ in. apart along any strand of the inner layer. Two layers of copper are wound over the "I" beam, each layer being wound in opposite directions.

Just recently we have had another type of all-copper or composite copper conductor put on the market. This is called the *cellular* conductor. It is made up of solid copper wires and hollow aluminium-bronze wires or tubes, and can be set up into many different forms varying from all hollow wires to any combination and arrangement of solid and hollow wires of one or the other metal. At the moment it is considered a little early to give relative physical and other characteristics of this new line-conductor. It has been patented and is being manufactured by a well known firm of smelters, refiners, and manufacturers of copper wires and cables (Thomas Bolton and Sons, Ltd., of Froghall and elsewhere). It is hoped that, at a later date, the relative characteristics of this composite copper conductor will be published in such manner as to present a useful comparison with the accompanying tables which, as will be seen, are so arranged in order of importance showing the greatest ultimate strength and the least a.c. resistance, starting with copper-weld copper and ending with steel-cored aluminium.

The four types of *cellular* conductor shown in Table I represent but a few of the many possible arrangements and combinations. The conductor construction, and the combination of metals used in the make up, will be self explanatory from Table I.

In this country our climatic conditions are such that we have a relatively greater humidity, heavier fogs, extended periods of moisture content in the air, and a relatively more extensive sea frontage than other countries operating overhead lines at voltages of 132 kV and over. In view of these natural adverse conditions, we should take great care in our choice of the conductor metals, their construction, and their composite make up.

Our best type of conductor for this country is unquestionably that form of construction offering a concentric stranded cable. In India and Africa, and similarly dry climates, the lock-wire cable would be the better type of conductor to use. As regards the metal to use on such important main lines, the writer believes that the two most questionable metals are steel and aluminium. Our climatic conditions are in various ways adverse to steel in the form used with aluminium for the most vital main transmission lines of the country, and our extensive coast-belt and other factors present disadvantages and/or dangers to ageing and to durable factor-of-safety, etc., in the use of steel, and to aluminium that is often in itself subjected to equivalently greater stresses and to greater and more bending and relatively greater movement due to temperature, and winds, etc.

Although local corona losses, and resistance to corrosion of the stronger metal (steel), are dependent upon the amount of moisture in the air, they are also dependent on the actual water adhering to the metal which sooner or later passes through in minute quantity to the steel core and thus endangers the real strength of galvanised-coated steel as well as on the surface-form and on the actual diameter of the conductor in its stressed condition as also the different ageing of the two metals and the chemico-physical conditions set up; all of which must be carefully considered.

	C.M. of Aluminium	Diameter of steel-reinforcement (inch)	Total (lb.)	Aluminium Strand (lb.)	Reinforcement (lb.)	Ultimate Strength (lb.)	Ohms per 1 000 ft. at 20° C. D.C.	Ohms per 1 000 ft. at 20° C. 60 Cycles	Micro-henries per 1 000 ft. at 60 Cycles
0·912	556 500	0·3270	746	522	224	20 900	0·0312	0·0312	4·3
0·953	605 000	0·3177	779	568	211	21 270	0·0286	0·0286	4·3
1·000	666 600	0·3333	858	626	232	23 430	0·0258	0·0261	4·3
1·093	795 000	0·3642	1 024	747	277	27 950	0·0218	0·0221	4·3

For such like main lines, the high first cost of conductors is by no means the most important factor deciding against the most necessary factor of *permanent* durability and factor of safety, etc., in favour of reinforced *copper*.

It must be remembered that a fraction of an inch in length subjected to corrosion is all that is necessary to down a line; yet there are millions of these, or millions of chances, in a rust-forming country like this for corrosion to set in wherever a minute part of the steel (the galvanising of which forms only a thin skin over the steel and is likely to crack, form hair-lines, peel off, be imperfect, etc.) receives moisture from the air or a minute quantity of water from the outer conductor; one of the worst parts will be at or close to each insulator, on the line side.

The available figures for one make-up of the "cellular" conductor, to which reference is made earlier in this article, are given as follows:

Overall diameter of conductor (taken as the equivalent of 7d. for 37 wires of 0·105 in. diameter, each wire)	0·735 in.
Equivalent copper section	0·196 sq. in.
Total weight per 1000 ft.	910 lb.
Weight of copper per 1 000 ft.	640 lb.
Weight of aluminium-bronze per 1 000 ft.	270 lb.
Aggregate strength of single copper wires	1 854 lb.
Aggregate strength of single aluminium-bronze wires	9 666 lb.
Total strength	20 520 lb.
Estimated breaking strain of the conductor (Based on percentage of the aggregate)	17 800 lb.

OXY-CRYSTALLINE FINISHES.

Experiments to Obtain Characteristic Effect Without Flame.

THE oxy-crystalline style of finish, which has recently been largely adopted by manufacturers of scientific apparatus, including radio sets and accessories, has an appearance somewhat resembling the effect produced by frost on windows, except, of course, that it is black.

Most readers will be familiar with the appearance of the finish, and it is thought that a brief explanation of the method by which it is produced and particulars of some experiments carried out in this connection at the laboratories of Philips Lamps, Ltd., will be of interest.

The apparatus to be treated is first covered with lacquer containing raw Chinese wood-oil, and then brought into contact with the fumes of a gas or paraffin oil flame, at a temperature of about 100 deg. F, causing a pattern of ripples or crystals having the appearance of frost crystals to be formed. This peculiar effect is caused by the fumes, but it has not yet been ascertained by what component.

Carbon dioxide, carbon monoxide, and water vapour singly and mixed, have been experimented with; and coal gas and sulphur dioxide have also been tried, but to no effect.

As very small amounts of hydrogen peroxide can be produced in the combustion process, experiments were also carried out in a box containing a quartz mercury arc lamp. The ultra-violet radiation of this lamp produced ozone and peroxide of hydrogen. When air at 100 deg. F. was passed into the box, the crystalline surface began to appear in about 20 minutes, without the aid of a flame.

The experiment does not provide definite proof that peroxide of hydrogen is the active agent present in the fumes of the flames, but in any case it is an interesting fact that oxy-crystalline surfaces can be produced without any flame.

THE ROTOR BEARINGS OF ELECTRICITY METERS.*

Manufacturing Problems Enumerated—Comparative Advantages of Jewels—Troubles with Bottom Bearings.

By W. LAWSON, M.I.E.E.

IN a paper† read before the South Midland Centre of the Institution, the author enumerated the principal defects to which meters are liable and described a method of recording the condition of meters removed from circuit, as ascertained on examination in the repair shop. Such statistics are useful as a means for obtaining data for any particular line of research in meter maintenance, and this paper is based on experiments and observations made in the study of the most prominent defect to which all meters of the motor type are liable, namely, the wearing of the rotor bearings.

In directing attention to this problem the author does not claim to have found a general solution, but he hopes that an account of his work and observations in this connection will not only be of interest to meter engineers, but may lead to a definite advance towards a solution.

For the purpose of this paper, it is sufficient to limit consideration to the bearings of single-phase and polyphase a.c. and mercury motor ampere-hour d.c. meters, as these constitute the majority of motor meters in use in this country.

The bearing arrangement consists essentially of a pivot working in a holed bearing at the top end of the rotor spindle, and the combination of a cupped jewel and pivot, tapered to a point, at the bottom of the spindle. Whilst there is a variety of designs, they all conform to this arrangement.

Various stones which rank high in the scale of hardness are utilised for the footstep bearing. The most favoured are rubies and sapphires. Garnets have been used in this connection, but are now generally discarded. Rubies and sapphires can be produced artificially, and it is claimed for them that they are more uniform in quality, and slightly harder, than the natural stones. Artificial rubies and sapphires rank the same in hardness, they differ only in colour.

The hardest known natural substance, the diamond, is used, but only to a limited extent, owing to its high cost. The bearing surface is cupped as with other stones, and its manufacture in this form is a highly specialised art.

Mercury Motor Meters.

The combination of a diamond having a flat bearing surface, surmounted by a holed sapphire to keep the pivot in place, has been suggested as offering less difficulty of manufacture, but with what success the author is unable to ascertain.

Steel is the material almost universally employed for pivots. The degree of hardness, molecular structure, and composition of pivot steel are questions which users are not as a rule in a position to investigate, although they are undoubtedly of importance.

So far as the author is aware, no attempt has been made to introduce oil-immersed bearings in mercury motor meters. A point of interest in connection with the bottom bearings of mercury motor meters may be noted. It has been found experimentally that in order to ensure the best possible starting, it is necessary to ascertain the correct depth of setting of the jewel in the bearing screw. The selection of a jewel set at the right depth to replace one which is too deep-seated can have the effect of reducing the starting current from 1/100th to 1/200th of full load, other conditions being favourable. The explanation may be found in the retarding effect of surface tension of the mercury acting on the pivot.

Both top and bottom bearings of motor meters are subject to defects which are liable to affect the performance of the meters more or less injuriously, but the bottom bearing is by far the greater sufferer.

It is true that top-bearing defects can be sufficiently serious, as in the rare case in which the top pivot dropped off its spindle through the action of rust. Usually, however, the defect takes the form of a certain slight stickiness, due to the collection of dust or rust or the presence of oil, but the errors thus introduced are not extensive.

Turning now to the bottom bearings, the outstanding weakness is in the bearing jewel. It is not too much to say that the frequency of jewel failures is the chief stumbling block in the way of achieving an ideal standard of reliability of meters in service.

The working area of the jewel is of almost microscopic dimensions, but the importance of keeping it in proper working condition cannot be exaggerated, as the occurrence of any fault almost invariably results in deficient registration, which means a dead loss to the undertaking. The extent of this deficiency is governed partly by the torque of the meter, but mainly by the weight of the rotor and the nature of the jewel defect.

Diamond Cupped Bearings.

In mercury motor meters, notwithstanding the extremely light downward pressure exerted by the rotor, cavities of appreciable depth have been bored by the action of the pivot. More frequently the wear is exhibited as rough patches on the surface, and in one case there was a broad scar extending from the centre to near the edge of the cup. The markings sometimes take the form of circles which are considerably larger in diameter than the diameter of the pivot, and it is probable that these are caused by out-of-balance of the rotor. The phenomenon of worn jewels in d.c. meters is even more difficult of explanation than that of a.c. meters, but it provides evidence in support of the conclusion that the weight of the rotor is not a determining factor.

It is probable that the advantages to be gained by the use of diamonds for the footstep bearings of meters were first recognised in America, where they have been produced and used extensively for the last 25 to 30 years. The superiority of diamonds over other stones in this connection has been pointed out by Mr. C. H. W. Gerhardi,* who was the first to use them in this country.

The successful results obtained in the early experiments with diamond cupped bearings carried out by the author led to their adoption in the Birmingham undertaking for use in generating ring-main and traction meters. Having proved their worth in this connection, their use was extended (gradually, because of the frequent difficulty of obtaining them) to h.t. consumers' meters.

In the hope of finding a cheaper and equally reliable substitute for the diamond bearing, the author took an opportunity afforded him in 1922 to carry out a series of tests with agate pivots working in sapphire cups. The conclusion arrived at was that neither the agate nor the sapphire pivot is suitable for use in polyphase meters, owing to the heavy rotors and large working forces employed.

Where the cost of a diamond bearing represents a small item in the total cost of the metering equipment it offers a complete solution of the bearing problem. With low-priced meters its use from a financial point of view is debatable, but might be justified in the long run. Users of meters should seriously consider the question of adopting diamond jewels in all meters of, say, 50 kW and over, and manufacturers should assist in this by placing themselves in a position to supply them.

In a.c. meters, vibration contributes to the wearing of the jewel, and becomes more destructive with increased working forces in the meter (compare tests of agate pivots in polyphase and single-phase meters). Care should be taken not to overload meters heavily, even if they are designed for accurate performance under such conditions.

Oil-immersion extends the life of the jewel and reduces the effect of wear on the accuracy, but is subject to physical changes and cannot be trusted for sufficiently long periods.

The agate pivot provides a possible means of solving bearing troubles in mercury motor meters which would be subject to very light action and free from the possibility of damage in transit.

Given bearings of the durability of the diamond, reasonably protected against dust accumulation, the pivots of all moving parts being made of rustless material and no oil being used, there is no reason why with modern a.c. meters the period of exchange should not be extended to 10 years or even longer.

STRUCTURAL STEEL FOR GENERATORS.

Manufacturers' Experiences with New Constructional Materials—Electric Welding Improvements—Possibility of Using Steel Plate End Flanges for Large Units.

DURING the last few years, due largely to revolutionary advances in the art of steel welding and cutting by flame and arc, great possibilities have been opened up for developments in the mechanical construction of electric generators. For this reason the following extracts from a special report of the Electrical Apparatus Committee of the National Electric Light Association, New York, are of particular interest. The report is presented in the form of statements by four large manufacturers. Work along similar lines is, of course, now going on in this country.

With regard to the use of structural steel and welding, one firm states that during the past year it has built a number of generators and motors having parts such as stator yokes, bases, rotor spiders, and bearing pedestals for roller bearings constructed of electrically welded steel parts. Experience so far with welded frames and bases has been quite satisfactory, there being a considerable saving in pattern work and pattern storage, and it is expected that the use of this type of construction will undoubtedly become very general. Although the frames made from structural shape and steel plate have ample strength, there is danger, if care is not taken in the design, that sufficient stiffness and rigidity will not be obtained. In fact, cast iron has definite advantages from the point of view of rigidity, but there is no reason why welded frames cannot be so designed and braced that they will be equally good in this respect.

Another firm estimates that 90% of its salient-pole synchronous machines as now designed are of structural steel.

There are, it is stated, several reasons for the recent tremendous increase in the use of structural steel and welding as a substitute for the use of castings. The cost of constructing patterns and the expense of storing them, the loss occasioned by defects in the castings, and the likelihood of failure in service as a result of internal strains, blowholes and the like, are some of the disadvantages of the old method.

With the development of flame cutting of steel plate, the designers have become convinced that steel plate will not only eliminate casting defects but will also produce better mechanical structures. In fact, factory tests have demonstrated that the new method of construction eliminates the disadvantages of castings, and produces a structure superior in strength and reliability.

In the welded-plate stator construction, as applied to horizontal units, the side plates consist of segments cut from heavy rolled-steel plate, which are welded together by means of the hydrogen-enveloped arc. The use of this arc-welding process eliminates the necessity of scarfing the joints between segments, and at the same time insures a ductile weld. The supporting feet of the units are cut out as part of the side plates, and a heavy foot plate is welded to these feet. The back plates are flame-cut, are rolled to the proper shape and are then welded to the side plates by an automatic arc-welding machine, which produces a practically perfect weld. The ribs for supporting the casting on which the stator laminations are stacked, are also welded to the side plates.

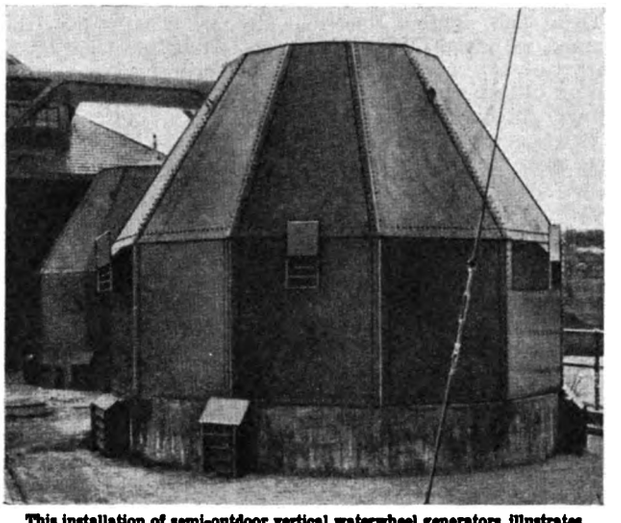
Practically the only cast frames which are used at the present time are for high-speed synchronous motors.

The disadvantages of castings are of even greater importance when rotating elements are considered, especially those rotors which are subjected to high stresses from overspeed. Structural-steel spiders of several types have been developed.

Spiders for small rotors have been built in considerable number of welded steel plates. The hub is flame-cut from thick steel plate or from shaft stock, and is welded to a centre web also flame-cut from heavy plate or stock. The outside rim is of steel plate, rolled to the proper diameter and welded to the centre web. This rim may be either of a single plate with arc-welded butt joint, or of two plates completely welded together around the outer edges. Since the rim is welded to both sides of the web plate around the complete periphery, the welded joint of the rim is not required to withstand the entire centrifugal force occasioned by rotation of the poles.

Another design of rotor spider which eliminates the use of castings is the so-called laminated punched type, which can now be used in sizes up to 10 ft. in diameter. The ventilating openings and dove-rail slots for the fastening of pole pieces are all punched in advance by a press.

An entirely new development is represented by the rotor spider of the third general type. This spider has a free rim, made of segmental punched laminations mounted on a centering spider, which may be of either structural or cast construction. The laminated rim is not anchored to the centering spider, and therefore must carry all the centrifugal force occasioned by the rotating of the poles. Since the centre has only to support the weight of the rim and of the poles, and to transmit the torque from the shaft, it is permissible to use cast material in this part of the structure. However, fabricated centres have been used in a number of machines.



This installation of semi-outdoor vertical waterwheel generators illustrates the simplified construction permitted by the newer structural methods and materials.

Almost all of this company's large turbo-generator frames are built of structural steel and are constructed from flame-cut boiler plate. A rib support is welded to the inside of the supporting plate, in order to secure sufficient surface for the bolting of the ribs. The ribs themselves are cut from steel plate and have machined surfaces, with a keyway left for supporting the punchings. On the outside of the circular supporting plates, which make up the sections of the units, there are welded ribs of steel plate.

It is still the practice to cast out of non-magnetic steel the end flanges for large units. However, in the case of auxiliary generators, and even in the case of some of the smaller main generators, the flanges have been made of steel plate. They have given very satisfactory service, and there is the possibility that plate flanges will be used on larger units.

The outer shell for the large unit is also made of boiler plate and is rolled to fit the supporting plates of the unit. The partitions are welded to the shell, an air-tight cover resulting.

The mechanical structure of direct-current generators, motors and synchronous converters has been changed considerably in the last year or two. All the magnet frames for these units are now made of rolled steel, in two parts. Each of these parts is rolled into the form of a semi-circle, and then bolted together to form the magnet frame. Feet for supporting the unit are welded on to this frame. Rolled frames have been made in diameters as large as 160 in., with a thickness of 9¾ in. and a width of 26 in. In fact, in the case of a steel-mill motor, the frames were of such size that it became necessary to weld together two rolled frames to secure the proper width.

The rolled construction for magnet frames was adopted as a means of securing better commutation of direct-current machines, since there was felt to be less likelihood of flaws than in castings. In addition, the placing of the rolled frame on a so-called production basis has given rise to a less expensive unit.

During the past year, fabricated construction has been adopted for the standard lines of moderate-size low-speed horizontal and vertical synchronous motors and generators, general-purpose synchronous motors and the corresponding sizes of generators, direct-current generators, and motors, and 3 600 r.p.m. steam-driven turbo-generators.

ELECTRICAL SALESMANSHIP.*

Selling the Service rather than the Product—Possibilities of "Electricity Halls"—An Electrical Information Bureau—Newspaper Propaganda.

By "SALES MANAGER."

THE first problem that faces the ordinary sales manager is the existence or otherwise of a market for his goods. If a market exists, how much of it can he reasonably hope to secure? How much is his selling to cost on turnover? How many depots will he require?

These and kindred questions do not usually face those charged with the pleasant task of selling electricity. The market already in existence is but the criterion by which the market of to-morrow may be judged. Every single person is a buyer directly or indirectly of electricity, and therefore of electrical equipment. The only measure of the capacity to buy is the size of the purse; and on this point I shall have something to say later on. When the "prospects"—the potential buyers—of electricity are considered, you have the really remarkable situation of every prospect being anxious to buy. Electricity comes with a thousand new virtues—above all other illuminants in power and cleanliness, above all other heating agents in its freedom from work and worry. Interesting in a hundred different manifestations in every sphere of human endeavour; no wonder, then, that the man who talks electricity is sure of a ready audience.

Luxury or Necessity.

But it seems to an outsider that the vision of the majority of those engaged in "putting electricity across" is limited to rather old-fashioned notions. The idea seems to persist that electricity is a luxury, whereas it is a necessity. With few exceptions, restaurants specialising in the service of meals cooked by electricity, do not offer a popular priced meal The appeal to comparative wealth is usually much too insistent.

That is one angle of selling electricity which is capable of immense expansion. There should be in each centre a permanent exhibition of a general interest nature, where accommodation for all sorts of functions could be provided. In short, the electricity centre should be a centre of local activities, wherever it happens to be located—the most cheerful and convenient business place in the whole town. Wherever you go in the provinces you find a lack of such a social centre. The hotels in some degree cater for banquets, dances and other "events," but the hotel management are concerned first, last, and all the time with selling food and drink. There is no deeper motive such as there would be in our electricity halls—standing exhibitions all day and social centres in the evenings. You can think of half a hundred organisations that would be glad to pay a reasonable fee for the use of a charming series of rooms with a good dance floor for their social requirements—local societies, civic events, firms' social evenings, sports society dinners, and so on.

Every gathering in every "electricity hall" would be a first-class advertisement for electricity. It would provide an opportunity for modern lighting methods to be demonstrated: for new decorative fittings to be shown under ideal conditions; for the capacity of electrical heating to be proved; for the possibility of a cool temperature to be secured if the weather is hot.

The organisation of such electricity halls is not beyond the limits of immediate possibilities. The development of the domestic market means the establishment of an increasing number of "show-rooms" and there is no reason why, with good will and sound organisation, resources should not be pooled and a really useful and worthily impressive hall be erected in most of the important centres.

The point to be realised is the need for national selling of electricity, instead of the localised effort by small or great undertakings. These local efforts may be good within their limits or they may be as bad as the efforts of the local electricity company within my own area.

Every successful demonstration of the merits of electricity has repercussions on the business of every electricity undertaking, and the united efforts of a group must produce more important effects than the isolated propaganda of a series of companies and municipalities.

Propaganda on a really national scale would also include an information bureau with first rate personnel. There are so many points that the general public are interested in if only they knew where up-to-date and reliable information were available.

The time will come when odds and ends of information must be collated and indexed, and the sooner a bureau of information is available, the less work will be involved in making it effective. Think of the huge advantage the Selfridge Information Bureau has been to that store. All sorts of questions are asked and answered, and a sense of friendliness for the store which this service gives is helping in no small way in building up its business. That the information bureau of Selfridge's is up-to-date is proved by a letter the Secretary of the Race Course Betting Control Board mentioned recently. Selfridge's Information Bureau wanted full data of the manufacturers of totalisators—and they got it.

The Electricity Information Bureau would be advertised extensively, and all its inquiries would be indexed. The electricity undertakings supporting the bureau would be kept *au fait* with the general trend of inquiries, and specific requests for information would be sent to the undertaking operating in the inquirer's home area if the inquiry were of a nature calculated to interest the local undertaking.

I believe that the number of inquiries would surprise many of the heads of electricity undertakings, and I have no doubt that the Bureau would more than justify its existence.

Propaganda in the newspaper has been brought to a fine art, but I do not see electricity receiving its fairly deserved consistent publicity. Quite apart from space that is paid for in the shape of advertisements, the general Press is able to give quite a lot of space to news matter that has a general interest—if such news matter is prepared in a form suitable for publication. We need to remember that this is the age of persons and not of things—so far as the general Press is concerned, and the modern daily paper editor wants the human touch in every paragraph of his paper. What agency is there entrusted with the creation of public interest in the new force that has come into existence? How many people are able to work by electricity who would otherwise have to knock off at 3.30 in the winter afternoons? What has electricity done for the villages? What did electricity do during the great freeze? What new hopes, new ideas, new devices are there coming along? All these and a vast number of other points are good news value if only they are written in the right way, and it should be somebody's job to do for electricity what is being done for many other industries. But with this important difference. There is an interest in all things appertaining to electricity that is lacking in many other instances, and so the work of the propagandist for electricity should not be difficult—if only the thought of the human touch is kept ever present.

Service Before the Sale.

In the foregoing I have outlined three methods of selling which are not of the direct kind. They represent the new method of giving the public a service before sales are effected. This is real "sales promotion," and its manifold possibilities remain to be explored and then exploited by the men who are given the jobs to do. I have indicated some of the more obvious lines along which an economic staff for electricity might direct its efforts, and of necessity I have touched upon outstanding points only. It may be objected that some of these activities are well within the scope of the E.D.A. If they are, why is no more vigorous action taken? Lack of adequate contributions from the industry is often advanced as a reason why this, that, and the other scheme should not go forward, but, though I yield to none in admiration of the pioneer work that organisation has performed in the past, it is not altogether unreasonable to suggest that a development organisation which cannot find sufficient support to develop itself needs to do some constructive thinking along newer lines.

In the next of this series of articles I intend to put myself in the place of the sales manager of an electricity undertaking, who is anxious to extend his sales of electricity and of electricity consuming equipment.

[* This is the second article in an important series from the pen of a widely experienced sales manager who has enjoyed outstanding success in his own field.—ED.]

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Ideal Homes."

[To the Editor.]

Sir,—Your plea in "Current Topics" for a more representative use of electrical equipment in the village of "ideal" houses at the Ideal Home Exhibition is one which will receive the sympathy of all who are anxious to develop the domestic uses of electricity. Although E.D.A. was unable, for some reason, to arrange for the suitable display of electrical appliances in these houses, organisations in the gas industry managed to secure two out of the seven houses in which to demonstrate that "gas, suitably applied, is unrivalled from all points of view for supplying light and all the heat required in a house." One of the houses had a complete gas and coke service for lighting, heating, cooking, water heating, and refrigeration. Effects obtained by electrical means were closely imitated, as in the series of gas lighting fittings in which the burners are screened by tinted glass panels, and among other gas equipment seen in the villas were irons, clothes-drying cabinets, curling iron heaters, towel-rail heaters, coppers, "smoker's companion," pilot lights, and night lights. In one of these "gas" houses a feature is made of distant-controlled lighting. In the hall the light is controlled from the foot of the stairs, as well as from the door, so that the light may be switched on before entering the hall.

I must apologise for this gratuitous advertising of gas, but if it leads somebody in the electrical industry to arrange even one electrically equipped house next year it will provide its own excuse.—I am, etc.,

March 4th.

Factor of Safety of Concrete Poles.

[To the Editor.]

Sir,—In the paper referred to by Mr. Gauvain the formula given by Mr. Climie only applies to stresses in the steel and concrete.

It would seem that the figures are primarily based on a rectangular shaped reinforced-concrete beam having six longitudinal steel square-shaped bars that are wrapped on their outer ends with hoop wire; the reinforced concrete pole being of solid construction. The "Stobie" pole, coming from the same country, appears to resemble this type with the steel outside, in one piece, on each transverse side, to replace the three longitudinal steel rods on said sides.

The stress in the tensile steel is given as—

$$2\,\eta\,f'\,(1-k)/k$$

and the breaking stress of the concrete as—

$$kf/2\,\eta\,(1-k)$$

where—

f = stress in tensile steel. (Shown as varying from 32 000 to 50 000).

f' = breaking stress of concrete. (Shown varying between values of 760 and 2020 for different values of p and f).

η = E_s/E_c = modular ratio.

p = ratio of tensile steel to effective concrete area. (Shown as varying from 0·01 to 0·05.)

$$k = \sqrt{3\,P\,\eta + (2\tfrac{1}{8}\,P\,\eta)^2} - 2\tfrac{1}{8}\,P\,\eta.$$

Equating the total tension to the total compression, we have—

$$0{\cdot}666bkd + 3{\cdot}5\,\eta\,Ak - 2\,\eta\,A = 0$$

where—

A = area of the steel.

b = breadth of pole.

d = effective depth of pole from compression face to steel.

kd = distance of neutral axis from compression face.

$200A/bd$ = taken as total steel reinforcement as percentage of concrete.

And, a condition is assumed where the resultant of the compressive stresses in the concrete almost coincides with the compressive steel, in which case the bending moment will produce a tensile stress in the steel equal to the bending moment divided by the product of Ah, where h is the distance between tensile and compression steel, centre to centre.

The formulæ given are helpful, but it is hoped that we shall get down to the bending moment formula similar to that used for wood poles.—I am, etc.,

William T. Taylor.

London, N.2.

Memorial to the Late Sir Alexander Kennedy.

[To the Editor.]

Sir,—That there should be a permanent and lasting memorial of affection and esteem for the late Sir Alexander Kennedy is a feeling common to all who knew him or his work.

He was a pioneer in engineering education, for, during his tenure of the Chair of Mechanical and Civil Engineering (1874-1889) at University College, London, he was largely responsible for the lines and methods which higher education in engineering has adopted. As an engineer in practice, his wide knowledge of mechanical and electrical engineering was always available for the service of the country.

In connection with the Centenary Celebrations of University College, a movement was inaugurated to endow the Department over which he long presided with such distinction; and some time ago he had consented to the Chair in the Department being called by his name. Towards the sum of £30 000 required for this endowment, a sum of £18 035 has already been subscribed, leaving the amount of £11 965 still to be raised.

We are in hearty sympathy with this project, and feel that no more suitable Memorial of Kennedy's great work could be established. We invite all those who knew Kennedy to associate themselves with this memorial.

Subscriptions should be sent to the Right Hon. Lord Meston, the Chairman of the Centenary Fund, at University College, London.—We are, etc.,

"Electricity Supply and the Consumer."

[To the Editor.]

Sir,—Mr. J. Rutherford Blaikie has taken Dr. Lulofs's discussion of domestic tariffs as a challenge or occasion. Dr. Lulofs can doubtless take care of himself if he sees fit.

Mr. Blaikie makes some statements which are too sweeping. For example: "All our load factor enthusiasts, disregarding the extent of the consumption, and reckoning only on the load factor, maintain that it is right to charge the individual consumer in accordance with a load factor analysis." I do not know where there are to be found any who advocate charging the individual consumer on a load factor basis only, much less where such a basis of charge is applied to all consumers. That load factor must be taken into account in any rational or equitable tariff is held by every one who has studied the question, including, I think, Mr. Blaikie himself. Mr. Blaikie, however, advocates a tariff which entirely ignores the load factor of any consumer, or class of consumers, making each consumer's rate depend exclusively upon the extent of the consumption of each. That this will work out with enormous discrepancies in the ratios of costs of supply, and the charges made for it, as between individual consumers, or between classes of similar consumers, he has before now admitted, but considers that immaterial.

From the point of view of the seller who has produced and sold a certain quantity at some total cost, including fixed charges, it is immaterial whether the income covering these costs with a satisfactory margin of profit has been obtained through the agency of a tariff which distributes the costs fairly, or one which operates unfairly, as between different consumers.

But from the point of view of a seller who wishes to increase the utility of his investment, and who also recognises a duty to afford the maximum of amenity to the population within his area of supply, it is important to establish a tariff which is approximately equitable, i.e., approximately charges each consumer in proportion to what it costs to supply each.

That this cannot be carried out exactly is obvious and admitted. But to charge solely on the basis of consumption

Digitized by Google

is a serious departure from equity and sound commercial principles. For it means undercharging some and overcharging others. Its effect must be to keep away consumers who might be had on remunerative terms, and to attract consumers of a less remunerative character.

I do not agree that the ordinary man's demand for " equal quantities of the same article at the same price " exists in the sense suggested by Mr. Blaikie. The ordinary man has no use for electrical energy *per se*. He wants his house lit, his food cooked, his bath water heated. A kilowatt-hour used in lighting, in cooking a meal, and boiling a kettle, is not to him " the same article."

Mr. Blaikie's inverse quantity tariff must include a rate near the maximum for the business of cooking, heating, etc., in small houses—say, for consumptions of about 2 000 units annually, or, alternatively, it will attract nothing beyond the lighting consumption in such houses, say, 400 to 500 units annually ; probably not much of that.

Such a tariff attracting the small house total business will grossly undercharge large consumers for lighting only. It is doubtful whether a flat rate with discounts for quantity, or stepped down for quantity, can at the same time attract the small domestic consumer and prove reasonably remunerative. But I admit that a good deal depends upon the character of the area.

The real difficulty in bringing the average cost to the consumer much closer to the cost of generation is, admittedly, low load factor. In other words, the capital assets employed have a low coefficient of utilisation. The coefficient of utilisation is usually lower for distributing than for generating plant.

Few of those in control of supply undertakings seem to bother about their distributing load factor, even to the extent of knowing what it is for different sections and areas. The diversity factor between different areas improves the station (supply centre) load factor, but a good distribution load factor in one area does nothing to offset the effects of a poor load factor in another area. It is the increasing domestic uses which offer the best field for improving the sectional distributing load factors, and the resultant supply centre load factor. Also, such uses, encouraged by a suitable tariff, will improve the number of consumers per unit length of mains, which Mr. Blaikie rightly deplores.

Mr. Blaikie points out that many small consumers do no more, some less, than pay the fixed charges. The remedy is to turn them into larger consumers, and I do not think that any tariff but one which is approximately equitable will work that change.

The capital costs of connecting individual consumers do not vary directly with either the maximum demands or the consumption. For domestic consumers up to, say, 5 kW of maximum demand they are pretty uniform. This is an item which should be considered and covered in assessing the fixed charges element in any tariff.

For practical purposes it will probably serve all ends to take into account the load factor of separate classes of consumers, which involves the diversity factors within each class ; and the diverstiy factor among the classes which enters into the station load factor.

It is, confessedly, somewhat difficult to solve the problem of an equitable tariff of practicable simplicity, which does not bewilder or raise the suspicions of would-be consumers. It is in the way of solution by several plans. So far as these plans move in the right direction they reduce the difficulties, and one may say that the problem tends to solve itself, because the incidence of standing charges lessens as the collective load factor improves. If and when the average load factor is 50% instead of the present average of about 25% it will seem a simpler matter than it is at present.—I am, etc.,

HENRY M. SAYERS.

London, S.W.16.

The B.I.F. Arrangements.

[TO THE EDITOR.]

SIR,—As an exhibitor in the Electrical Section of the British Industries Fair at Castle Bromwich I was glad to read your outspoken comments last week on several matters which undoubtedly detract from the efficiency of the Fair as at present conducted.

Exhibitors at this Fair can hardly be blamed for expecting not only that overseas buyers will be invited, but also that on arrival in this country their journey to the Fair should be made as easy as possible, and that their comfort should be the first consideration of all concerned during their presence at the Fair.

Actually, as your remarks seem to me to infer, the overseas visitor is entirely overlooked, while special steps are taken to interest and entertain people in our own industry, who are, on such an occasion, of little interest to exhibitors.

The arrangement of luncheons and conferences to discuss electrical matters, which could be more conveniently dealt with in other surroundings, serves only to clog the normal machinery, and does not assist export trade in any way. The admission of the general public is another bar to efficient working, and I am at a loss to imagine why such people are admitted, unless it is done to give the impression that the Fair is really a busy place.

Like many others, my firm went into the Fair with a view to developing our export trade. We can secure our home business by means other than the B.I.F.—I am, etc.,

" EXHIBITOR."

March 4th.

[TO THE EDITOR.]

SIR,—It seems to me, as a member of one of the stand staffs at the Birmingham Fair, that the visits of electrical associations and the admission of the general public are both expedients devised to cover up the poor attendance of foreign buyers. If this assumption is correct, one may further assume that the contention—of which I believe you, Sir, are a strong advocate—that the Fair is now being held at the wrong time of the year, is sufficiently proved.

Whenever this question has been raised in the past we have been told that the majority of the exhibitors were against a change in date. The only way to establish this is for the Fair Committee to take a ballot among the electrical exhibitors and then publish the result, giving the figures voting for and against retention of the present date. I venture to suggest that such a ballot would provide a good majority in favour of a change to May or June.—I am, etc.,

March 5th.

Qualification for Wireless Trade Membership.

[TO THE EDITOR.]

SIR,—The letter by the secretaries of the Wireless Retailers' Association in your last issue refers to the points raised by your correspondent " Amused " (see THE ELECTRICIAN, February 15th, 1929, p. 196), but evades the real question.

If radio trade associations tacitly admit that the chief requirements for the granting of trade terms to a retailer is the display in a window of radio components, the suggestion that they " regard technical ability as a highly desirable attribute " would seem to be little more than a pious platitude.

The W.R.A. complains of the activities of the mechanics and engineering employees now " dabbling " in the wireless trade, but has it ever considered that many of these people are being directly encouraged by radio trade associations which have little interest in the technical qualifications of their members. It is by no means difficult to imagine that some of the " dabblers " have far more technical knowledge than some of the established radio retailers. The radio trade in general is at fault in not encouraging the development of its retail sales through electrical engineers.—I am, etc.,

" QUIZZICAL."

Manchester.

NEWS IN BRIEF.

Hull and Foreign Telephone Cables—New Electricity Showrooms—The Electrical Position in Poland—Leyton and Electricity Meters—Batti Wallahs' Annual Dinner.

A REGULAR telephone service between Vienna, Berlin and Buenos Ayres was begun on March 1st.

Preesall Council has approved a scheme for electrical installation work on the hire-purchase system.

Bath Electricity Department announces daily cooking demonstrations at the showroom in Dorchester Street.

The Metropolitan Asylums Board is to renew the fire alarm system at High Wood Children's Hospital, at an estimated cost of £475.

The British Columbia Government has approved the West Kootenay Power and Light Co.'s undertaking on the Pend Oreille river.

It has been decided by the Roumanian Council of Ministers that the use of code telegrams by private firms and persons is again allowed both for inland communications and for abroad.

Ilford Electricity Committee has had under consideration the question of the erection of new offices and central show and store rooms, and suggests a site at the junction of High Road and Clark Road.

The Polish Ministry of Public Works has published data relating to Poland's electric power stations at the end of 1925. The total production of electricity was 1 667 435 000 kWh. Out of 631 towns in Poland only 278 possess electrical plants, of which 143 are municipal and 135 private.

Several tenders for cable were considered by Hull Telephones Committee last week, and in each case the lowest tender (whether British or foreign) was accepted. Where the difference was only £2 or £3 a motion to accept a British tender was defeated, and a German tender accepted.

Leyton U.D.C. has decided not to accept a tender for electricity meters, but that the Electrical Engineer purchase meters as and when required and, if unable to obtain them from British firms at prices reasonably near those quoted by foreign firms, suitable meters be purchased from foreign firms.

Benn Brothers' Dramatic Society, which gave successful performances of the mystery play, "The Creaking Chair," at King George's Hall, London, on February 22nd, and at the John Benn Boys' Hostel, London, on March 1st, will give a third performance of the play at the Scala Theatre, London, on March 18th.

Christchurch (N.Z.) Corporation's electric vehicle garage supplies charging and garage facilities for all sizes of electric vehicles. Rates are offered covering charging, and general care of batteries, and the garage staff carry out repairs on request from the owners. The number of vehicles at present in the garage is 37.

The Commercial Cable Co. has inaugurated new services of night and week-end cable letters to the United States, Canada and Newfoundland. These telegrams may be handed in at the company's offices or any Post Office in Great Britain and Ireland. The charge per word to New York is 2d. for the night service and 1½d. for the week-end cable.

Brighton Tramways Committee has approved a design for an illuminated sign to be displayed at the Aquarium shelter during next summer.

Good progress is being made with the construction of the Island Falls power plant at Churchill river, the most northerly power development in Canada.

Chesterfield Gas and Electricity Sub-Committee recommends that the proposed amalgamation of the gas and electricity showrooms be not proceeded with.

It is stated that works in connection with the provision of 15 new automatic telephone exchanges in Scotland will be authorised by the Post Office during the next few weeks.

Immediate steps are to be taken by Douglas Electricity Committee to have electricity showrooms prepared in Ridgeway Street, Douglas, at a cost of £1 000, plus £500 for appliances.

New offices and showrooms of Eastbourne electricity department were opened last week, in the presence of the Mayor and Town Council and others, by Sir Andrew Duncan.

A resolution that new showrooms, storerooms, and offices be erected at the corner of Smith Street and Samuel Street, was passed by Rochdale Electricity Committee at its last meeting.

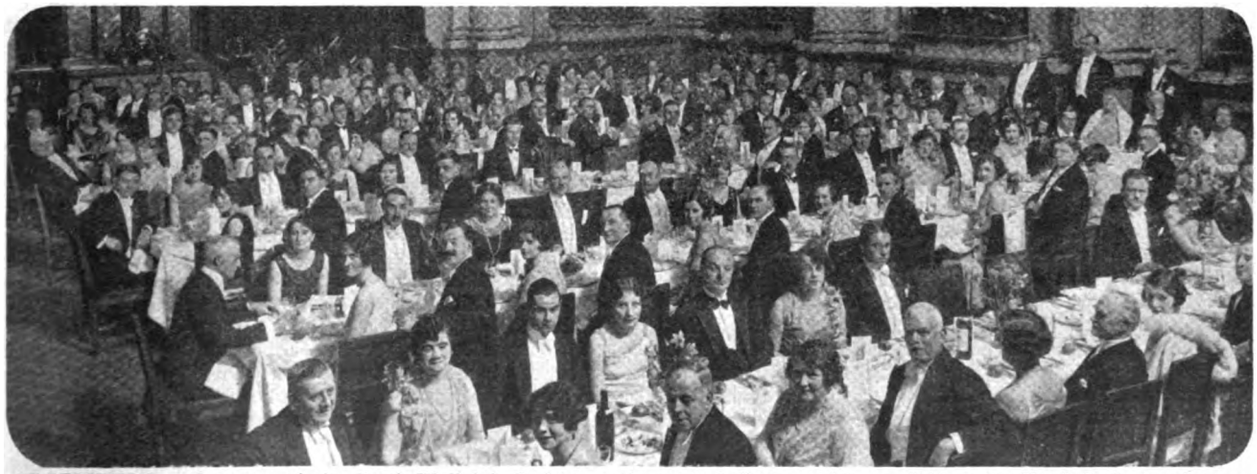
Preston Housing Committee has decided to rescind the resolution giving permission to the Preston Gas Co. to lay their service pipes in the 42 "all electric" houses being erected at Holme Slack.

Preparations for the installation of electrical plant for washing the exterior of passenger carriages on the L. and N.E. Railway at Cowlairs (Edinburgh) carriage sidings and also at Bridgeton Cross terminus have begun.

At a recent meeting of officials of the Marine Collieries, Cwm, Mr. R. Tedstone, the chief electrician, read a paper on underground telephones and signalling bells. He said bare telephone wires in mines, although permitted, were a potential danger. There was no danger in using bare wire in the signalling apparatus, as there was a safety device on the bell itself.

The Ministry of Transport has received an offer from a company to instal illuminated road "white lines," as an experiment, and the Ministry has asked Paddington (London) Borough Council to grant facilities for the experiment. The Council is recommended to agree to the provision of an illuminated white line 25 to 30 ft. in length, at the junction of Bayswater Road and Edgware Road.

The Leicester Isolation Hospital takes a supply of electricity from the Corporation electrical mains, and the cost during the past year was over £1 000. The Health Committee intends to instal two 75 kW generating sets, with the necessary switchgear, etc., the cost being estimated as follows:—Two 75 kW generating sets, £1 358; foundations, £44; pipe work and valves, £100; switchboard and cable, £180; alterations to existing engine room, £120. The committee is advised that the necessary supply can be generated by the proposed new plant for 0·366d. per kWh.



MEMBERS and guests of the Batti Wallahs' Society at the annual dinner which was held at the Hotel Cecil, London, on Friday, March 1st. Another photograph appears on our picture page.

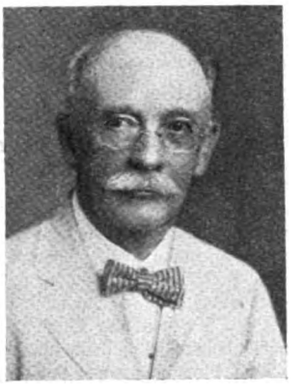
PERSONAL.

SIR James Donald has joined the board of the Calcutta Electric Supply Corporation, in the place of Mr. P. V. Luke, deceased.

The late Sir Henry Trueman Wood, who was for many years secretary of the Royal Society of Arts, left £47 210, with net personalty £46 943.



Dr. E. Weston, who has established a Fellowship with the American Electro-Chemical Society.

Dr. Edward Weston has established the Edward Weston Fellowship with the American Electro-Chemical Society. The candidate will be selected by the Society and selection will be based on marked capacity in carrying out research in electro-chemistry or its applications. The award will be made without distinction on account of sex, citizenship, race or residence, and the successful candidate may carry out his research at any university or institute approved by the Society. Dr. Weston was born in England in 1850, and went to the United States in 1870, when he devoted his time to the invention of new types of low voltage generators, and established in Newark, in 1875, the first factory in America devoted exclusively to that class of machine. In 1881 his plant was consolidated with the United States Electric Lighting Co., of which he was electrical engineer till 1888. At that time he formed the Weston Electrical Instrument Co., of which he has been president for many years.

Mr. V. Bingham has resigned his appointment as publicity manager to Crompton Parkinson, Ltd., and is taking up a similar position in the North of England.

Estate of the gross value of £4 412, with net personalty £4 069, was left by the late Mr. John Ferguson, general manager of the Perak River Hydro-Electric Power Co., Ltd.

Mr. Gordon Robbins, deputy chairman of Benn Bros., Ltd., publishers of THE ELECTRICIAN, has been elected chairman of the Council of the Newspaper Press Fund for the ensuing year.

Alderley Edge and Wilmslow Urban Councils, which have taken over the undertaking of the Alderley and Wilmslow Electric Supply, Ltd., have appointed Mr. E. Hesketh as manager.

Nelson Corporation has approved the Electricity Committee's recommendation that Mr. G. F. Nayler, borough electrical engineer, be permitted to act as consulting engineer to Barnoldswick U.D.C.

Col. the Hon. Francis V. Willey, a member of the Central Electricity Board and a past president of the Federation of British Industries, by the death of his father, Lord Barnby, assumes the peerage.

Mr. W. P. Hicks, who has for nearly 16 years held a responsible position in the technical sales department of Crompton Parkinson, Ltd., has left to join the Haviland Engineering Co., of Alloa. His colleagues presented him with a silver cigarette case.

Mr. H. C. Spence, assistant maintenance engineer with the Yorkshire Electric Power Co., has been appointed electrical engineer by the Holmfirth Urban Council in succession to Mr. J. W. Fawcett. There were 66 applicants for the post. He joined the Yorkshire Electric Power Co. in 1926.

Mr. G. A. Halmshaw, of Dewsbury, late inspector of telephones, who has retired after 40 years' service, has been presented by the staff of the engineering department with a divan easy chair and a mahogany clock. Mr. Halmshaw commenced his career with the National Telephone Co.

Mr. Robert Roper, the power station engineer of the South Wales Electrical Power Distribution Co., and a member of the Pontypridd U.D.C., and chairman of the Electricity and Tramways Committee of that Council, has just been appointed to the Bench of Magistrates for the County of Glamorgan.

Mr. T. Parker, of Ribble power station, has accepted an appointment at Calcutta Electricity Works and sails for India to-morrow (Saturday). On March 1st he was presented with a gold wristlet watch, a travelling trunk and a case of electrical instruments by Mr. S. Wood, superintendent of the station, who referred to the valuable services of Mr. Parker. Mr. R. Dickinson (deputy superintendent) and Mr. Lucas (Blackpool transmission cable superintendent) added their tributes.

The Lamme Medal Committee of the American Institute of Electrical Engineers has awarded the first (1928) Lamme Medal to Mr. Allan Bertram Field " for the mathematical and experimental investigation of eddy current losses in large slot wound conductors in electrical machinery." The Lamme Medal was founded as a result of a bequest in the will of the late Mr. Benjamin G. Lamme, chief engineer of the Westinghouse Electric and Manufacturing Co., who died on July 8th, 1924. Mr. Allan Bertram Field, consulting engineer of the Metropolitan Vickers Electrical Co., Ltd., was born at New Barnet, Herts, in 1875. After receiving his early education in London, he attended the Finsbury Technical College (1890-1893) and was awarded diplomas in both electrical and mechanical engineering. Following studies at St. Johns College, Cambridge, from 1896 to 1899 and the passing of the Mathematical Tripos examination, he was awarded the Honours B.A. degree. He was later awarded the M.A. degree in the regular course. He took the Honours Science examination of the University of London, and received the Honours B.Sc. degree in 1900. Previous to his education at St. Johns College, Mr. Field had been employed in shop work and drafting in and near London for about two years. From 1899 to 1902, he was engaged in engineering work in traction, power, and lighting projects with the British Thomson-Houston Co. in London. In order to become more familiar with American practice, he joined the General Electric Co. of America in 1902 and spent more than a year in the Testing Department in Schenectady, afterward being engaged in transformer design. From January, 1905, to October, 1908, he was employed in the Bullock Electric Manufacturing Co. and the Allis-Chalmers Co. in the design of a.c. generators and motors. He joined the engineering forces of the Westinghouse Electric and Manufacturing Co. in 1909 and was engaged in the design of salient pole alternators. In 1911 he was appointed engineer-in-charge of turbine-generator design. During the next two years he was responsible for the development and commercial introduction of the built-up rotor design, which has ever since been followed by that company, and solved, in collaboration with Mr. Lamme, many problems of turbine-generator design. He was consulting engineer and professor of mechanical engineering at Manchester University from 1914-1917, and during the next three years was with Vickers, Ltd., in London. Since 1920 he has been consulting engineer with the Metropolitan-Vickers Electrical Co., Ltd., Manchester, England. Mr. Field is the author of a number of important papers on electrical machinery which appeared in the Transactions of the Institute and other engineering publications. He joined the Institute in 1903 and became a Fellow in 1913. He is a member of the American Society of Mechanical Engineers, the Institution of Electrical Engineers and the Institution of Mechanical Engineers.

Obituary.

MR. W. R. SPAVEN, on March 1st. He was for twenty-four years manager of Portsmouth Corporation Tramways. He retired two years ago.

MR. C. E. CROCKER, on March 4th, as the result of a motor accident. He was general manager of Perth (W.A.) City Council Electricity and Gas Department.

MR. JOHN DUGDILL, aged 66 years. He was one of the oldest electrical installation contractors in the country, but, some years ago, devoted himself almost exclusively to the design and manufacture of " Dugdill's Patent "—lighting arms and fixtures of every conceivable shape and size to meet any special individual lighting problem that might arise.

MR. M. H. BOLLINGER, aged 45 years. He was born at Wellington, N.Z., and in 1905 came to this country as test bed assistant with the Phoenix Dynamo Co., later taking a position as draughtsman with Siemens Bros. Dynamo Works, Ltd., on d.c. motor and a.c. generator design until 1908. He then returned to New Zealand, subsequently becoming, in 1920, general manager of the electrical department of A. S. Paterson and Co., Wellington, the position he held at the time of his death.

DR. CHARLES S. DU RICHE PRELLER, at his home in Edinburgh, on Sunday, aged 84 years. Dr. Preller was an eminent civil and electrical engineer and also found opportunity for much literary work. He had been engaged in earlier years in railway and electrical undertakings in Saxony, Italy, and Switzerland, and was formerly chairman and chief engineer of the Dimmat Valley Electric Railway. He was the author of a number of papers on engineering, and was awarded prizes by the Institution of Civil Engineers.

LEGAL INTELLIGENCE.

Application for Extention of Patent by British Thomson-Houston Co., Ltd.

IN the matter of letters patent bearing date May 8th, 1913, numbered 10 918/1913, and granted to the British Thomson-Houston Co., Ltd., for "Improvements in Incandescent Electric Lamps," an originating summons issued on behalf of the company and asking that the terms of the patent may be extended for five years will come before Mr. Justice Luxmoore on April 9th for directions as to the hearing, and any notices of objection must be lodged at least seven days before that date.

Lamp Patents Infringed.

In the Chancery Division, on February 20th, Mr. Justice Clauson, on a motion for judgment in default of appearance and defence, granted an injunction to the British Thomson-Houston Co., Ltd., restraining J. Isow, of Alvington Street, Hackney, and Alfred L. Finegold, of Blakesby Street, Commercial Road, E., from infringing two incandescent electric lamp patents, and passing off.

His Lordship also made an order for the delivery up of infringing lamps.

Mr. Tookey, for the plaintiffs, said the particulars of sale referred to 44 cases of infringing lamps.

In the Chancery Division before Mr. Justice Eve on February 22nd, Mr. Trevor Watson again mentioned the case of the British Thomson-Houston Co., Ltd., against the City Incandescent Light Co., in which his lordship on the previous Friday granted ex parte an injunction restraining infringement of plaintiffs' letters patent with respect to gasfilled lamps. His Lordship granted a perpetual injunction.

NEW YEAR HONOURS LIST.

Electrical Names in the List of Awards.

THE official list of New Year Honours issued on February 28th, the publication having been delayed two months by the illness of the King, contained the following:—KNIGHTS: Prof. J. A. Fleming, F.R.S., Emeritus Professor of Electrical Engineering, University College, London; Lt.-Col. C. B. Levita, chairman of London County Council; Col. T. F. Purves, engineer-in-chief, Post Office. ORDER OF ST. MICHAEL AND ST. GEORGE: Mr. M. F. Headlam, chairman, Pacific Cable Board. KNIGHTS BATCHELOR: Mr. G. A. Julius, chairman of the Council for Scientific and Industrial Research, Commonwealth of Australia. ORDER OF THE BRITISH EMPIRE (G.B.E. Civil Division): Sir W. S. McCormick, F.R.S., chairman of the Advisory Council of the Department of Scientific and Industrial Research; (O.B.E. Civil Division) Major J. A. Sadd, Mr. P. A. Theis, assistant secretary, Pacific Cable Board; (M.B.E. Civil Division) Mr. J. A. B. Jones, assistant electrical engineer, Sudan Government Railways and Steamers; ORDER OF THE INDIAN EMPIRE (C.I.E.): Mr. E. E. Gunter, director, Persian Gulf Telegraphs, Indo-European Telegraph Department (retired). See page 307.

LAMP MANUFACTURE.

Large Increase in Efficiency of British Standard Electric Lamps.

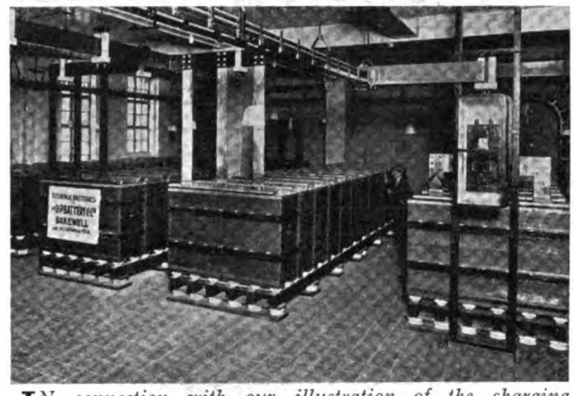
A recent reference to the issue of the British Standard Specification for electric lamps called attention to some of the improvements which have been established in lamp manufacture. It is interesting to note that the Specification reflects the results of the large amount of research work carried out in recent years by the British manufacturers, in that the efficiencies of gasfilled electric lamps have been substantially increased, whilst still retaining the average life of 1 000 hours. The improvements in manufacture have also made it possible to keep the light centre length constant within less than half the variation found necessary in 1925 when this specification was last revised.

A contract has been let for the construction of the dam in connection with the British Columbia Power Co.'s hydro-electric works on the Stave river. The new plant will have an initial capacity of 43 000 H.P. and provision is made for the addition of a further unit of similar capacity when necessary. The total cost is estimated at $7 250 000.

I.E.E. STUDENTS.

Big Attendance of Members and Guests at London Section's Annual Dinner.

THERE was an attendance of nearly 140 members and guests of the London Students' Section of the Institution of Electrical Engineers at the 22nd annual dinner at Les Gobelin's Restaurant on Tuesday. Mr. S. H. Hart was in the chair and the guests included Mr. P. V. Hunter, Mr. H. T. Young, and Mr. P. F. Rowell. Lieut.-Col. K. Edgcumbe was prevented by illness from attending.



IN connection with our illustration of the charging plant at the Metropolitan Telephone Exchange, Wood Street, London, in the February 22nd issue, the D.P. Battery Co., Ltd., has sent us the above picture showing two batteries at the exchange, each consisting of 25 cells, "D.H. 69-plate" D.P. type of 9 987 Ah capacity.

Mr. L. S. CRUTCH, in proposing the toast of the Institution, drew attention to the fact that about 25% of the Institution's membership of 13 000 was furnished by students. He deplored the small attendances at the students' meetings, and hoped that in future more students would go to the meetings. The Institution played a great part in electrical affairs and it was up to the students to do their share.

Mr. P. V. HUNTER, in reply, said that following many years of association with the Institution, he believed that it was, and would continue to be, of great benefit to the electrical industry. The fact that all sorts of sectional associations were growing up was no weakness of the Institution. On the contrary, it showed that electrical engineers were virile and keen on their work. He looked to the young people in the Institution to play a larger part in conducting its affairs.

Mr. MOFFAT, in proposing "Our Guests," revealed the fact that the Students' Section now had several lady members in its ranks, and Mr. H. G. COUSINS, who replied, remarked that the Students' Section of the Institution of Civil Engineers had been similarly favoured. He expressed regret that the I.C.E. Students had not recently found a suitable opportunity for a joint meeting with the I.E.E. Students, but it was hoped that further meetings of this kind would be arranged in the future.

Mr. H. T. YOUNG proposed "The Students' Section." He thought that the London Section, with its 1 290 members, should get a better muster at its meetings. There was a great future for trained electrical engineers. Referring to the distinction conferred upon two well-known members of the I.E.E., Prof. J. A. Fleming and Col. T. F. Purves, Mr. Young said that the field open for young electrical engineers to-day was still wide enough to make it possible for many of the students present to rise to similar heights of achievement.

Mr. S. H. HART, in a brief reply, mentioned that the attendance at the dinner was the largest they had had for six years. Although attendance at discussions and meetings could not be called satisfactory, it was improving gradually. The Committee had authorised him to invite suggestions for means to increase the numbers of students attending meetings.

An enjoyable entertainment was provided by Messrs. Morland Hay and Jay Greene, and Mr. F. Corthesy was again prevailed upon to give some of his dramatic recitations.

A photograph taken during the evening is reproduced on page 303.

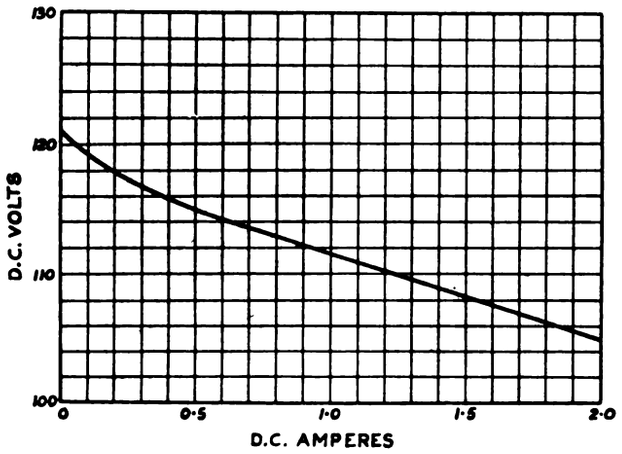
BATTERY CHARGING.

WE have received from the WESTINGHOUSE BRAKE AND SAXBY SIGNALLING CO., LTD., of 82, York Road, King's Cross, London, N.1, particulars of the Westinghouse metal rectifier style R.P.20, for charging large batteries. In these



The voltage regulation curve of the Westinghouse R.P. 20 rectifier.

sets the adjustable reactive transformer, as used in the R.T.10 and R.P.10 models, is replaced by a transformer and tapped reactance housed in the rectifier casing, the connections from the reactor taps being taken to a six-way switch, each of the six studs giving a different charging rate. This R.P.20 rectifier is made in six types for an a.c. input up to 600 V, with outputs in d.c. volts of 110–114, 110–114, 55–57, 200, 6, and 22–26, the amperage being in each case as written, 0·3–2·0, 0·4–3·0, 0·5–6·0, 0·2–1·5, 1·5–2·0, 1·0–10. In larger sizes, three-phase sets can be built, although for battery charging this introduces some complication in respect of economical regulation of the output.

The construction is much the same as for the other Westinghouse models, while the efficiency curve gives a high reading even to a 1/10th of the full load. It is claimed that in the event of the a.c. supply failing when the rectifier is charging, the value of the reverse current from the battery is negligible, while charging will restart immediately the supply is again available. Uses for the rectifier other than charging include the operation of solenoids, relays and contactors to avoid noise and chatter, magnetic chucks, faceplates, clutches, separators and small speed motors, alternator excitation, synchronous motor excitation, alarm and signalling systems, and electro-medical apparatus. The makers point out that in cases where it is desired to avoid using a transformer, it may be worth while designing the d.c. apparatus for working at such a voltage that it can be used on the rectifier direct-coupled to the supply. When this is done, it should, however, be borne in mind that the rectifier still forms a direct link with the supply system and must therefore be insulated accordingly.

It will be appreciated that the d.c. output voltage for any given a.c. voltage is not easily defined as being the a.c. voltage less a certain resistance drop, but depends on the form factor of the workin; conditions. In most cases it may be taken that the ratio of a.c. to d.c. voltage is on open circuit 1·2 to 1, and on full load 1·4 to 1, giving approximately 20% drop in volts from no-load to full-load, as shown by the voltage regulation curve above.

CHECKING ALTERNATOR FREQUENCY.

We are informed that in the United States successful efforts are being made to keep the average frequency of alternators at a constant speed. For this purpose, the Warren Company supply a Graham dead-beat clock with seconds pendulum as a master in each generating station, and provide a seconds hand concentric with a Telechron seconds hand so that any lag or advance is at once revealed.

The linking up of our own generating stations under the Central Electricity Board demands something better and it is interesting to learn from the Synchronome Co., Ltd., of 32/34, Clerkenwell Road, London, E.C.1, that the London Power Company, Ltd., is combining the use of Telechron synchronous motors with the Synchronome system of electric clocks.

IN PARLIAMENT.

Replies to Questions of Electricial Interest in the House of Commons.

IT is proposed to instal 23 police telephone boxes in the Metropolitan Police Richmond sub-division, and 20 in the Wood Green sub-division.

There are now 237 centres approved by the Ministry of Health or the Board of Education for artificial light treatment. It is understood that steady progress is being made with the provision of these facilities.

The B.B.C. and Income Tax.

Assessments to Income Tax have been made on the British Broadcasting Corporation in respect of its profits, including any profits derived from publishing newspapers, etc., but the Corporation disputes liability.

There is at present no known system of wireless communication capable of being worked at a cost which would justify its installation for communication between the small outlying islands round the coast of Scotland.

Certain fatal accidents have been due to faulty insulation of electricity in bathrooms. The wiring arrangements in private houses are not under the control of the Ministry of Transport or the Electricity Commissioners.

Replying to a question whether he would interchange electricity and the merchant marine which are at present under the Ministry of Transport and the Board of Trade, respectively, the Prime Minister states that he has noted the suggestion but does not think it practicable.

For the period from April 1st to December 31st last the gross receipts of the Post Office from the Imperial beam wireless services are estimated at about £380 000. The credit balance in respect of the same period (before charging depreciation or interest on capital) is estimated at about £152 000.

The Communications Co. in connection with the cables and wireless merger scheme has not yet been formed, and no agreements or contracts have yet been concluded. The Government intends to lay before the House of Commons any agreements or contracts for which the Government is responsible.

The Minister of Transport does not think there is at present any prospect of the introduction of complete uniformity in the charges for electricity in London, but the Joint Electricity Authority is reviewing the existing tariffs, and proposes to consider how far a greater uniformity in the methods of charge could be recommended.

There is no Post Office wireless station at Stornoway. The existing wireless station at Lochboisdale, with which Stornoway is connected by wire, is brought into use as quickly as possible when the cable between Stornoway and the mainland breaks down. It is not considered that the expense of re-opening of the Stornoway wireless station would be warranted.

The President of the Board of Trade understands from the chairman of the Baird Television Development Co. that the annual meeting was deferred in view of negotiations with the General Post Office and British Broadcasting Corporation (which were in progress in the latter part of the year) for the provision of facilities for an experimental broadcast of television, that arrangements have only just reached a stage at which progress can be reported to the shareholders, and that a general meeting has now been held.

With regard to a question as to the proposed disconnection of Stockport telephone subscribers resident in the Heaviley and Cale Green wards from the Stockport automatic telephone exchange and their connection with a new manual exchange to be known as Hazel Grove, the Assistant Postmaster-General says the Stockport automatic exchange is one of the older type of automatic exchanges, and the manual exchange is the most economical method of arranging for the telephone extension in this area.

The Postmaster-General informed both the British Broadcasting Corporation and the Baird Television Development Co. a few months ago that he would be prepared to agree to the use, subject to suitable conditions, of one of the corporation's stations for experiments with television apparatus. The corporation decided, after their officers had witnessed a demonstration of the Baird system, that it did not then fulfil the conditions which would justify a trial through one of their stations, although they expressed their readiness to review this decision if and when development justified it. A further demonstration was given last week and the question of using a broadcasting station for television is to be reconsidered.

IMPERIAL CHEMICAL HOUSE.

A Brief Description of the Electrical Effects in New London Offices.

THE fullest possible use of electricity is made in Imperial Chemical House, Millbank, the new head offices of Imperial Chemical Industries, which were opened publicly on February 22nd. Among the unique features of the building is the installation of panel cooling, the system being driven by an electric motor of 130 H.P. There are nine passenger and two goods electric lifts, each being provided with a micro-levelling device which automatically brings the car within a quarter inch of floor level on stopping. The power supply is taken from the mains of the Westminster Electric Supply Corporation and practically all motors in the building are three-phase in type; the collective loads are light, 400 kW; heating, 168 kW; cooking, 285 kW; and power, 779 H.P. Artificial daylight is used throughout, and in the offices lamps are concealed in glazed recesses in the ceiling. Staircase halls are lighted through special "laylights," the lamps behind being fitted with specially designed reflectors having matt white surfaces. No natural lighting is provided in the corridors, the illumination being carried out by means of rectangular ceiling panels, reaching a maximum of 6 ft. candles under panels. Octagonal diffusing ceiling fittings are used in the conference rooms and elsewhere.

The directors' rooms are illuminated by electro-mechanical ceiling lights, consisting of reflectors fitted with daylight lamps, and a mechanism incorporating a solenoid which raises and lowers the ceiling by way of controlling the amount of light. The device is actuated by means of a push button, either at the desks or the doorway, which completes a low voltage circuit, for energising a series of relays; these latter then simultaneously bring the solenoid into operation. This results in the movable portion of the ceiling being raised, and the light gradually coming into effect with a dimmer in circuit. A second pressing of the push button completes a circuit which causes the intensity of the lighting to be reduced by 50 per cent. without affecting the raising and lowering device, while a third pressing of the button causes a complete reversal of the operation—i.e., the lights gradually fading out, and the movable portion of the ceiling being lowered into position.

Cornice lighting is employed in the refectory and special fittings also project light from outside through lunette windows. The colonnades are lighted by means of Allom reflectors behind the columns causing the latter to stand out in bold relief. The main interior courts are floodlighted, while in the basement area daylight lamps are used in diffusing pendant globes. In lavatories, combined door locks and switches are fitted, operating small local lights. These are run at low voltage from small local transformers. Desk lamps in the form of globes are provided in the more important offices. On each globe the map of the world is reproduced in relief.

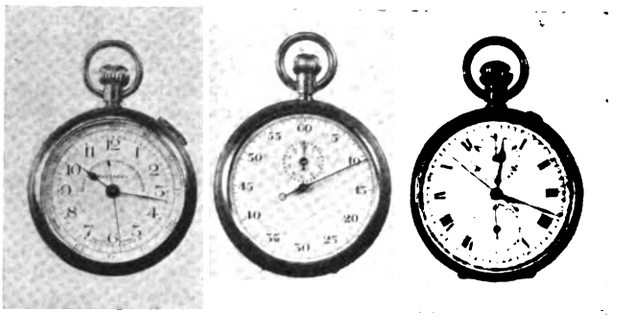
Other Details.

Among other interesting electrical features of the building are the operation of the main doors on the Millbank front by means of a push button actuating electric motors. There are electric bells with indicators of a specially designed luminous type and electric clocks are installed on the Synchronome system, one master clock controlling approximately 540 dials throughout the building.

The whole of the wiring for the electric lighting, power, bells, etc., was carried out by T. Clarke and Co., Ltd., electrical contractors, of 129, Sloane Street, London, S.W.1. The magnitude of the work can be estimated when it is mentioned that the number of points installed runs into several thousands and the amount of wires and cables installed is well over 70 miles, also the steel conduits exceed ½ million feet. To control the installation, a switchboard has been installed which is made up in three panels, which cover a length of 41 ft.; the power panel is equipped with one 1 000 A t.p. main breaker and seven 200 A t.p. outgoing control breakers; the heating panel is equipped with twelve 500 A s.p. breakers and three 1 000 A s.p. breakers and the lighting panel is equipped with three 500 A s.p. main breakers and nine 250 A s.p. sub-breakers. The board was made by the Astral Engineering Co. to T. Clarke and Co.'s specification. Other firms connected with the installation are Lighting Trades, Ltd., Newbury and Thomas, Waygood and Otis, Ltd., the Reliance Telephone Co., Ltd., the Synchronome Co., Ltd., Neon Lights (1928), Ltd., Metro-Vick Supplies, Ltd., W. T. Glover and Co., Ltd., the Steel Tubes and Conduit Co., and the Walsall Hardware Manufacturing Co., Ltd.

ENGINEERS' STOP WATCHES.

A RANGE of stop watches suitable to the needs of electrical and other engineers has been placed on the market by A. ARNOLD AND Co., of 17, Elmcroft Avenue, Golders Green, London, N.W.11. The "Fortress" pattern shown in the



The range of stop watches offered by A. Arnold & Co.

left-hand picture serve the purpose of both an ordinary watch and a stop-watch, giving accuracy to within a fifth of a second. It is a 30-hour lever movement instrument, guaranteed for 12 months. In addition to the usual minute and hour hands a centre seconds hand is fitted, one complete revolution being made per min. over a scale graduated in fifths of a second. The stopping and starting movement is given by a small projection on the outer rim of the case. The centre illustration shows the Arnold "Racing Recorder," fitted with lever movement, and minute and second hands only. It has starting and stopping and fly-back actions, re-setting both hands to a zero reading. Still another product is the fly-back "Chronograph," illustrated on the right. This is a 15-jewelled lever with independent centre seconds hand.

ELECTRICAL WOMEN.

Activities of the Electrical Association for Women during February.

ON February 7th, a large party of members of the Electrical Association for Women visited the Soho School of Cookery when Miss Mabel Collins, the principal, gave a lecture-demonstration on a "Five Course Dinner." During the afternoon Miss Collins gave some useful cooking hints which were very much appreciated.

The second evening lecture of the association was given on February 12th at the E.L.M.A. Lighting Service Bureau, by Mr. A. de H. Donisthorpe, of the General Electric Co., Ltd. Mr. Donisthorpe dealt with the history of wireless and the development of television and radio pictures; lantern slides and films and practical experiments added to the interest of the evening.

On February 19th many members availed themselves of the invitation to visit the showrooms of the Singer Sewing Machine Co. Talks were given on the history of the sewing machine, and members were both interested and amused at the contrast between the model of the first Singer machine made and the latest electric model.

The Birmingham and Midlands Branch of the association held another "Outlet Campaign" meeting on February 12th, with Lady Brooks (president) in the chair. Mrs. L. A. Wilson spoke on "House Problems from the Woman's Point of View."

Mr. T. R. Martin spoke on the "Red Seal" Campaign in Canada, and how well the movement was progressing.

Mr. Forrest, in a very clear and lucid manner, dealt with off-peak loads.

At the last meeting of the North Wales branch of the association, Mr. Price F. White, borough electrical engineer, Bangor, gave an address on domestic electrical appliances and his views were reinforced by Mrs. White's experiences. Among the apparatus demonstrated were electric cookers, heaters, radiators, ultra-violet rays, artificial sunlight, and washers.

The British Thomson-Houston Co., Ltd., has tendered an invitation to members to visit the Ideal Home Exhibition on March 13th, and the Hotpoint Electric Appliance Co. is inviting the party to luncheon and tea. Parties of members from Birmingham, Cheltenham and Ashford will be attending and it is expected that well over 200 members will take part in this visit.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

LIVERPOOL CORPORATION.—Electrically driven pumps for Aubrey Street pumping station. Specification, etc., from the Water Engineer, 55, Dale Street, Liverpool; deposit £2 2s.

PORTSMOUTH CORPORATION.—Supply and installation of four electrically driven vertical circulating pumps, each capable of pumping 10 000 gallons of water per minute. Specifications from Mr. B. Handley, Electricity Department, High Street, Portsmouth.

WALSALL AND WEST BROMWICH UNIONS JOINT COMMITTEE, March 8th.—Supply of electric fittings, etc. Forms of tender, etc., from the Clerk, 22, Lombard Street, West Bromwich.

LEEDS CORPORATION, March 9th.—Supply of single-phase (2 000 and 6 600 V), three-phase (6 600 V) and Scott-connected transformers, as required over a period of two years; and 11 000 V three-phase transformers (10 500 kVA), for early delivery. Specification from Mr. C. N. Hefford, Electricity Department, 1, Whitehall Road, Leeds; deposit £1 1s.

Supplies for Poor Law Institutions.

OLDHAM GUARDIANS, March 11th.—Supply of electric lamps and fittings. Forms of tender from Mr. F. W. Fletcher, Union Offices, Oldham.

PERTH CORPORATION, March 11th.—Electric lighting work, in connection with erection of 16 houses at Crieff Road, Hillyland, Perth, 44 houses at Darnhall Drive, and 36 houses at Rigg's Road. Schedule, etc., from the Burgh Surveyor; deposit £1 for each.

WARRINGTON CORPORATION, March 11th.—(1) Motors; and (2) transformers. Specifications from the Borough Electrical Engineer; deposit £1 1s. for each.

BELFAST GUARDIANS, March 12th.—Twelve months' supply of electrical fittings, etc. Forms of tender from Mr. R. H. Wilson, clerk to the Guardians.

MANCHESTER CORPORATION, March 12th.—Supply of trucks for electric tramcars. Specifications, etc., from the general manager, Corporation Tramways, 55, Piccadilly, Manchester.

NORTH BRITISH ALUMINIUM CO., LTD., March 12th.—Supply and installation of all material required for electric power and lighting distribution system, at the company's works, near Fort William, Inverness-shire. Specification, etc., from the Company's Offices, Adelaide House, King William Street, London, E.C.4.

BERMONDSEY (LONDON) GUARDIANS, March 13th.—Six months' supply of electric lamps (item 68). Form of tender from the Clerk, 283, Tooley Street, S.E.1. Stamped, addressed envelope to be sent.

DUNDEE CORPORATION, March 13th.—Supply of l.t., paper insulated, lead covered and double steel tape armoured cable, to B.E.S.A. specification for working pressure up to 660 V. Specifications, etc., from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee.

LEEDS CORPORATION, March 13th.—Electric lighting installation at Gateforth Sanatorium, Hambledon, near Selby. Form of tender, etc., from the City Engineer.

ISLINGTON (LONDON) GUARDIANS, March 14th.—Six months' electrical supplies. Forms of tender from Mr. Albert King, Guardians' Offices, St. John's Road, Upper Holloway, N.19. Stamped, addressed envelope to be sent.

SHEFFIELD CORPORATION, March 14th.—Buildings, civil engineering works and constructional steel work (specification B.M. 64); transformers (B.M. 66); pipework and valves (B.M. 69); e.h.t. three-phase switchgear (B.M. 71); battery locomotive and accessories (B.M. 74). Specifications (deposit £3 3s. for each) from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield.

BELFAST EDUCATION COMMITTEE, March 15th.—Electric light installation in Riga Street and Montcollyer Elementary Schools. Specifications, etc., from the Education Architect, Victoria Street, Belfast; deposit £1 1s. for each.

EDINBURGH CORPORATION, March 15th.—One 1 500 kW motor-converter, for Dewar Place sub-station. Specification from Mr. E. Seddon, engineer and manager, Electricity Department; deposit 10s. 6d.

BRADFIELD RURAL DISTRICT COUNCIL, March 18th.—Electric motors (with switchgear) for driving air compressors, at Pangbourne sewage works. Specification from the engineer, Mr. C. H. Stafford, 209, King's Road, Reading; or the Clerk, Town Hall Chambers, Reading.

EDMONTON GUARDIANS, March 18th.—Six months' supply of electric lamps, and X-ray, light, massage, etc., requisites. Forms of tender from the Clerk, 77, Bridport Road, Edmonton, London, N.18. Stamped, addressed envelope to be sent.

LANCASTER CORPORATION, March 18th.—Two water-tube boilers, to evaporate 36 000 lb. of water per hour, with mechanical stokers, etc., at Caton Road generating station. Specification, etc., from the Borough Electrical Engineer; deposit £2.

MANCHESTER CORPORATION, March 18th.—Twelve months' supply of incandescent lamps. Forms of tender, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

NEWTON ABBOT URBAN DISTRICT COUNCIL, March 18th.—Supply of pumping and other equipment, with electric motors, control panels, etc., for sewer construction works. Specifications from Mr. F. W. S. Stanton, 5, Victoria Street, London, S.W.1.

CARDIFF CORPORATION, March 19th.—Supply of e.h.t. and l.t., paper insulated cables during 12 months, commencing April 1st (specification No. N 64), and supply and erection of natural draught cooling tower (specification N 65). Specifications, etc., from the City Electrical Engineer, The Hayes, Cardiff. Only members of the King's National Roll are invited to tender.

HOLBORN (LONDON) GUARDIANS, March 20th.—Supply of electrical fittings, for six months. Forms of tender from the Clerk, 53, Clerkenwell Road, E.C.1. Stamped, addressed envelope to be sent.

METROPOLITAN ASYLUMS BOARD, March 20th.—Automatic telephone system at North Western Fever Hospital Hampstead, N.W.3. Specification, etc., from the Board's Office, Victoria Embankment, E.C.4; deposit £1.

PADDINGTON (LONDON) GUARDIANS, March 20th.—Six months' supply of electricians' sundries, etc. Forms of tender from the Clerk, 313-319, Harrow Road, W.9. Stamped, addressed envelope to be sent.

HULL CORPORATION, March 21st.—One 2 000 000 gal. per hour, electrically driven circulating water pump, motor, motor starter, etc. Specification from Mr. J. N. Waite, Electricity Works, Sculcoates Lane, Hull; deposit £1 1s.

STOURBRIDGE GUARDIANS, March 21st.—Supplies of electric lamps for six months. Particulars from the clerk, Mr. G. F. James, 12, Hagley Road, Stourbridge.

HARROGATE CORPORATION, March 23rd.—Twelve months' supply of cables, joint boxes, joint box compound, service meters, service cut-outs, and transformers. Specifications, etc., from Mr. N. McLean, borough electrical engineer, 33, Swan Road, Harrogate.

Electric Lighting of Tenement Buildings.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, March 25th.—Electric lighting installation in seven blocks of tenement buildings. Specification, etc., from Mr. David J. Keep, town clerk, Town Hall, Cambridge Road, E.2; deposit £2 2s.

EDINBURGH CORPORATION, March 25th.—Supply of materials to the electricity department for 12 months, including cables, conduits, fuses and fuse boards, electrical material, electricity meters, meter boards, etc. Specification from the Engineer and Manager, Dewar Place, Edinburgh.

GLOUCESTER CORPORATION, March 25th.—Supply and erection of two 1 000 kW motor generators, for conversion of 11 000 V 50 cycle a.c. to 460/500 V d.c. Specification, etc., from the City Electrical Engineer, Commercial Road, Gloucester.

ILFORD CORPORATION, March 25th.—Supply of paper insulated cables. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Ley Street, Ilford.

BROOK MOTORS, LTD., March 29th.—Electric lighting work, in connection with extensions to Empress Works, St. Thomas's Road, Huddersfield. Plans, etc., can be seen at the offices of Mr. J. Arnley, 55, New Street, Huddersfield.

Digitized by Google

RHONDDA URBAN DISTRICT COUNCIL, March 30th.—Supply of house service, a.c., ordinary and prepayment meters, cable joint boxes, compound, cut-outs, etc., for one year. Specifications, etc., from the Electrical Engineer, Electricity Works, Porth, Glam.

CENTRAL ELECTRICITY BOARD, April 15th.—Supply and erection of 33 000 V overhead transmission lines, in connection with the North West England and North Wales Electricity Scheme. Specification (No. N.W.E.-S.L.2) from Sir J. R. Brooke, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

MAYO COUNTY BOARD OF HEALTH, March 9th.—Electric lighting installation at Creagh House, near Ballinrobe. Specification from Mr. T. Flanagan, county surveyor, Castlebar; deposit £2 2s.

YUGO-SLAV MINISTRY OF COMMUNICATIONS, March 10th.—Supply of various materials, including electric welding apparatus, machine tools, Diesel engine with electric generator and switchboard, two electric motors (25 and 20 H.P.), various electric generators and other electrical materials, for the River Shipping Board; telegraph and telephone materials for the Construction Department; electric lighting sets for passenger coaches, for the Machinery Department, etc. (Reference C.X. 2 982.*)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 12th.—Supply of telephone relays (schedule C. 408). (Reference B.X. 5 078.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 12th.—Supply of switchboard cords (P. and T. 151/1 247). (Reference B.X. 5 017.)

BELGIAN MINISTRY OF RAILWAYS, MARINE, POSTS, ETC., March 13th.—Supply of bronze and copper wire. (Reference A.X. 7 604.)

BENGAL NAGPUR RAILWAY CO., LTD., March 15th.—Supply of five-ton overhead electric travelling crane. Specification, etc., (10s.), from the Company's Offices, 132, Gresham House, Old Broad Street, London, E.C.2.

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 26th.—Switchboard cords. (Reference B.X. 5 067.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 26th.—Supply of telephones and dials (schedule C. 401). (Reference B.X. 5 023.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 27th.—Supply and installation of electric lighting system for the town of Fashn. (Reference B.X. 5 037.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, March 28th.—Supply of telephone switchboard cords. (Tender No. 148), (Reference B.X. 5 048.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 2nd.—Supply of jumper rings and terminal strips (schedule C 405). (Reference B.X. 5 066.)

ARGENTINE MINISTRY OF PUBLIC WORKS, April 4th.—Supply of Diesel electric Titan crane. (Reference A.X. 7 583.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission line towers (specification 29/13). (Reference A.X. 7 401.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 15th.—Conductor cords (No. P. and T., 151/1 319). (Reference B.X. 5 098.)

Tenders Accepted.

ADMIRALTY.—Edison Swan Electric Co., Ltd., lampholders and insulators.

LONDON COUNTY COUNCIL.—Edison Swan Electric Co., Ltd., insulating blocks.

TONBRIDGE URBAN DISTRICT COUNCIL.—English Electric Co., Ltd., switchgear for sub-station.

METROPOLITAN WATER BOARD.—W. T. Henley's Telegraph Works Co., Ltd., supply of copper wire, £170.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL.—Edison Swan Electric Co., Ltd., supply of gasfilled lamps.

RUGBY URBAN DISTRICT COUNCIL.—W. T. Henley's Telegraph Works Co., Ltd., cables for extensions, £331 16s.

WEYMOUTH CORPORATION.—English Electric Co., Ltd., supply of isolation panel for sub-station switchboards, £117 3s.

MAIDENHEAD GUARDIANS.—Maidenhead Radio Co., electric light installation at The Gables scattered home, £13 4s. 4d.

LONDON COUNTY COUNCIL.—Edison Swan Electric Co., Ltd., supply of push keys, punch case parts and electric lamps.

CAMBERWELL (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., supply of electric lamps for 12 months. (Recommended.)

HALIFAX CORPORATION.—Gath Electrical Engineering Co., Ltd., electricians' work in connection with Moor End housing scheme (64 houses).

HORNSEY CORPORATION.—Synchronome Co., Ltd., installation of 27 electric clocks at town hall, £40, and rental of £16 6s. 6d. per annum.

SURREY COUNTY COUNCIL.—V. G. Middleton and Co., electric lighting work in connection with extensions at Brookwood Mental Hospital, £1 225.

LONDON COUNTY COUNCIL EDUCATION COMMITTEE.—Stegman and Co., electrical installation at Beaufoy Institute, Lambeth, £390. (Recommended.)

NEWBURY CORPORATION.—Hathorn Davey and Co., Ltd., electrically-driven pumping plant, to deal with storm water at sewage pumping station, £899 5s.

LANCASTER GUARDIANS.—E. W. Shepherdson, electric light installations at the institution, £645, the isolation hospital, £27, and the children's home, £99.

BRIDLINGTON.—S. Kilvington, electrical and other works in connection with alterations and additions to 83, 85 and 87, Hilderthorpe Road, for Mr. E. Wilson.

DONCASTER CORPORATION.—Callender's Cable and Construction Co., Ltd., extra high pressure cables, £106; Enfield Cable Works, Ltd., low pressure cables, £368.

CHELMSFORD CORPORATION.—Carter and Co., electric fire alarm system, £280; Post Office Engineering Department, wiring and maintenance of wiring for same.

GLOUCESTERSHIRE EDUCATION COMMITTEE.—Edwards and Armstrong, Ltd., electric light installation in meals room at Boys' Central School, Strand, Gloucester, £14 9s.

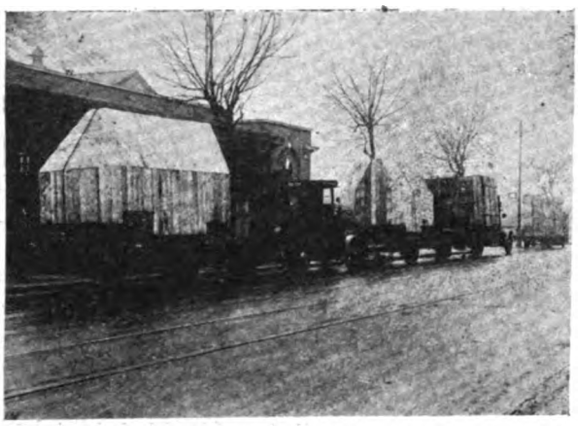
METROPOLITAN WATER BOARD.—Liverpool Patents Co., Ltd., electrically-driven "Trident" boiler scaling machine, with 1½ H.P. motor, etc., for Kempton Park Works, £65.

MEMBERS of the London Students' Section of the Institution of Electrical Engineers and their friends at the annual dinner at Les Gobelin's Restaurant, London, on Tuesday. The chair was taken by Mr. S. H. Hart, and in the absence, through illness, of Col. K. Edgcumbe, the guest of honour was Mr. P. V. Hunter. *A report of the speeches is given on page 299.*

Digitized by Google

LEEDS GUARDIANS.—Crompton, Parkinson, Ltd., supply of nine electric motors, for the laundry at the Institution, including two 25 H.P., one 10 H.P., one 7 H.P., four 3 H.P., and one 6 H.P.

CHESTERFIELD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., electric governing control gear, £168 6s.; English Electric Co., Ltd., spare armatures for turbo-condenser motors, £182.



WHAT are claimed to be the two largest searchlights in the world are here seen packed on Pickford's vans ready for shipment from the works of the London Electric Firm to a continental State, the total weight being 20 tons.

ILFORD CORPORATION.—A.F.A. Accumulators, Ltd., new cells for electric tower wagon battery, £147. British Insulated Cables Ltd., supply of trolley wire, 10½d. per lb. (Both recommended.)

ESSEX COUNTY COUNCIL.—Power Contracts, Ltd., electric wiring and installation of motors at Brentwood asylum, £9 674 5s.; Waygood-Otis, Ltd., two electric lifts at new county offices, Chelmsford, £1 379. (Both recommended.)

WESLEYAN CHAPEL, PWLLHELI.—Electrical Contracting Co,. electrical installatio., in connection with alterations and repairs, £30. Also tendered: B. W. Sprowell and Co., £25; West Wales Electric, Ltd., £29; National Electric Construction Co., Ltd., £35.

LONDON, MIDLAND AND SCOTTISH RAILWAY CO.—Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of Siemens gasfilled and vacuum lamps; Metro-Vick Supplies, Ltd., 12 months' supply of Met-Vick carbon, metal filament, vacuum and gasfilled lamps.

BRENTFORD GUARDIANS.—Reliance Telephone Co., Ltd., intercommunication telephones, for Warkworth House, Toolands House, and West Middlesex Hospital, £1 115, plus £10 for two indoor and two outdoor extension bells; re-wiring wireless installation at the Hospital, £100, less 7½%.

BATTERSEA (LONDON) BOROUGH COUNCIL.—British Electric Transformer Co., Ltd., two 500 kVA transformers, £467; Bertram Thomas, supply of switchgear, £1,167 5s.; Metropolitan Vickers Electrical Co., Ltd., provision of earthing system at power station, £203 19s. 9d. (All recommended.)

STEPNEY (LONDON) BOROUGH COUNCIL.—Wm. White and Co., 12 months' supply of steel conduits, for wiring department, £567 8s. 8d. (recommended). Also tendered: Wholesale Fittings Co., Ltd., £572 6s. 3d., P. L. Dwyer and Co., £603 16s. 3d., General Electric Co., Ltd., £643 14s., Sloan Electrical Co., Ltd., £661 18s. 2d.

WIMBLEDON CORPORATION.—A. Reyrolle and Co., supply of e.h.t. switchgear, and extensions to existing switchboards, £2 921 10s. 6d.; English Electric Co., Ltd., supply of h.t. switchgear equipments, £1 258 12s. 6d.; George Ellison, supply of l.t. switchgear equipments, £2 064 17s. 6d.; Metropolitan-Vickers Electrical Co., Ltd., one 2 000 kVA 10 000/2 000 V transformer, £635.

SWINDON CORPORATION.—Griffin, Harding and Bryant, wiring installation at the new power station, Moredon, £2 018 16s. 1½d.; Carter and Co. (Nelson), Ltd., supply, erection, connecting, wiring, etc., on open circuit system, of a Carter-Micro street fire alarm system, £853 12s., plus additional cost of special leading in wiring, and a 2 H.P. syren for calling members of the fire brigade, £70.

CROYDON CORPORATION.—British Electric Transformer Co., Ltd., supply of the following transformers: 1 000 kVA Scott-connected, 6 300 to 2 100 V, £570; two 750 kVA Scott-connected, 6 300 to 460/230 V, £872; two 500 kVA Scott-connected, 6 300 to 2 100 V, £660; two 400 kVA Scott-connected, 6 300 to 460/230 V, or 400/200 V, £604. W. Lucy and Co., Ltd., 133 electric lamp standards, £1 097 5s.

BIRKENHEAD CORPORATION.—Switchgear: New Switchgear and Construction Co., Ltd., three h.t. sheet steel switchgear cubicles, £329 5s.; English Electric Co., Ltd., one 11 000 Volt truck-type cubicle, £156 2s. 3d.; Ferguson, Pailin, Ltd., one h.t. outgoing feeder switchgear cubicle, £100 4s. 6d. W. T. Glover and Co., Ltd., supply of cable, £1 952 10s.; English Electric Co., Ltd., two 100 kVA indoor type transformers, £163.

GLASGOW CORPORATION—R. J. M'Intyre, electrical installations at 318 houses on Hagill estate, £1 240 18s. 2d., and at 174 houses on Saracen estate, £715 12s.; A. Reyrolle and Co., Ltd., sub-station switchgear; Ferranti, Ltd., four 400 kVA transformers; Bruce Peebles and Co., Ltd., six 200 kVA transformers; Waygood-Otis, Ltd., passenger lift, £1 173; and A. and P. Steven, Ltd., goods lift, £411, at Glasgow Cross Buildings; British Insulated Cables, Ltd., copper bonds. (All recommended.)

STOKE-ON-TRENT CORPORATION.—Painter and Madew, electric light installation at Stoke police station, £95 13s.; Barnett and Soans, overhead wiring and services to 170 houses on Hanford estate, £476 19s. 9d.; Metropolitan-Vickers Electrical Co., Ltd., supply of sub-station switchgear for 12 months; Callender's Cable and Construction Co., Ltd., supply of cables and laying mains for 12 months. Supply of sub-station transformers for 12 months: British Thomson-Houston Co., Ptd., 200 kVA; Metropolitan-Vickers Electrical Co., Ltd., 800 kVA.

LONDON COUNTY COUNCIL.—Alex. Hawkins and Sons, electric lighting, cooking and heating installation in central (No. 1) block of dwellings on Ossulston Estate, St. Pancras, £1 739. Also tendered: C. Lindop and Son, Liverpool, £1 393 3s.; G. V. Francis, £1 794 3s.; Hall's Longitudinal Lighting Co., Ltd., £1 834 17s. 5d.; Electricity Services, Ltd., £1 960; A. V. Gifkins and Co., Ltd., £1 999; Alpha Manufacturing and Electrical Co., Ltd., £2 150; E. Dyne, £2 246 10s.; Eons Electrical Co., £2 347 19s.; Tredegars (1923)Ltd., £2 354 8s.; Harland and Wolff, Ltd., £2 357 13s. 6d.; W. Davey, £2 362; Engineering Works (Electrical and General) Ltd., £2 367; Joseph Vigor, £2 492 11s. 11d.; A. Higginbotham and Sons, £2 530; Aldwych Electrical, Ltd., £2 592 10s. 5d.; H. H. Bucklar, £2 701; E. Wight and Co., £2 857 17s. 2d.; Fred Hodgson and Co., Ltd., £2 879; J. Nicoll, £3 684 10s.; General Electrical Maintenance Co., £4 219. Chief engineer's estimate, £1 790.

THE NATIONAL REGISTER.

Nineteen Contractors Accepted for Registration at March Meeting.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors, held at the Institution of Electrical Engineers on March 1st, 33 applications by electrical installation contractors for admission to the Register were considered. It was decided that 19 of these applications be accepted, and that the remaining 14 be declined.

The names and addresses of the newly registered contractors are given below: Ainley, John R., 196A, Roundhay Road, Leeds; Aspin, James A., Keighley Road, Colne, Lancs; Brentwood District Electric Installations, Ltd., King's Road, Brentwood, Essex; Brown and Roberts, 2, Albert Street, Barnsley, Yorks; Chapman and Inman, Tennant Street, Stockton-on-Tees; Collins and Sharp, 123, Meanwood Road, Leeds; Engineering Works (Electrical and General), Ltd., 7 and 8, Great Winchester Street, London, E.C.2; Graham and Zebedee, 75, Donegal Street, Belfast; Gray, James, and Son (Ironmongers and Electricians), Ltd., 89, George Street, Edinburgh; Kay and Morris, 176, North Road, Preston; Leonard, Vincent, 36, Berry Street, Belfast; Lucas, A. W., and Co., St. Martin's Chambers, 12A, Bull Ring, Birmingham; Peat, Herbert, 4, Dodsworth Court, Briggate, Leeds; Pritchard, A., and Co., High Street, Lye, near Stourbridge; Ryan, Leo. R., 37, High Street, Marlow, Bucks; Smith, Harold C., 1, Banstead Terrace, Roundhay Road, Leeds; Taplin, H. C., and Sons, 27, South Front, Southampton; Yewdall, Harry, 573, Meanwood Road, Meanwood, Leeds; Young, N., Albany House, Amble, Northumberland.

ELECTRICITY SUPPLY.

Extension of Electric Street Lighting in Battersea—Wallasey's Profitable Undertaking—Loan for Liverpool's New Station—Hampstead Pays Off All Loans—Additional Lines Between Blackpool and Preston.

CROYDON Electricity Committee is to extend mains at a cost of £1 042.

Barnstaple T.C. has decided to instal another 300 kW Diesel generating set in the spring of 1930.

Borrowing powers for £10 000 are being sought by Prestatyn U.D.C., for new meters and extensions to mains and services.

Lowestoft Works Committee recommends the expenditure of £648 per annum for the lighting of Normanston Drive by electricity.

The Derbyshire and Nottinghamshire Electric Power Co. is to erect overhead cable lines to supply electricity to Spondon and Hatton.

Winchester City Council has applied to the Ministry of Transport for consent to use overhead lines for the supply of electricity to Twyford and Compton.

Bromley (Kent) T.C. has entered into a new agreement for ten years with the West Kent Electric Co., Ltd., for a bulk supply. It is estimated that there will be an annual saving of from £1 700 to £2 000.

Wing R.D.C. has decided to approach Luton T.C. with the object of obtaining a supply of electricity for the Ivinghoe district from the h.t. line to be carried between Cheddington and Ivinghoe to Aylesbury.

West Ham T.C. has received sanction to a loan of £19 081, balance of an application for extensions, made up of buildings, £2 020; switchgear, £7 575; cooling towers, foundations, etc., £2 323; superstructures and pipework, £7 163.

Stepney (London) Electricity Committee recommends authorising the Borough Electrical Engineer to give effect to proposals for the wiring of the Calvert Buildings, Fulcher's Buildings, Allen House, and Plough Street Buildings.

Battersea (London) Electricity Committee has decided to substitute electric for gas lamps in further streets, at a cost of £1 468. Mains are to extend from Park Road, Battersea Bridge Road, to the premises of Hovis, Ltd., Anhalt Road.

Despite the fact that the assessment of Wallasey electricity undertaking has been increased from £3 000 to £10 000, it has been decided to place £10 000 to reserve, to allocate £5 000 to the relief of rates, and to reduce charges by ½d. per kWh.

Liverpool City Council is recommended to apply to the Electricity Commissioners for sanction to a loan of £1 767 644 for the acquisition of the Clarence Dock site and for the first stage of the erection and equipment of a capital generating station to contain two 50 000 kW alternators.

Hampstead (London) B.C. has decided to pay off all outstanding loans on the electricity supply undertaking, amounting to £32 310, out of accumulated surplus, thus leaving the undertaking free from debt as from March 31st. The prices charged for current are 3d. for lighting and ¾d. for power, heating and cooking.

During the frost, in the week ended February 17th, the electricity generated by Blackpool electricity department showed an increase of 36 per cent. compared with the average of the previous weeks. The maximum demand amounted to 13 290 kW, compared with 9 614 kW in the corresponding period of last year.

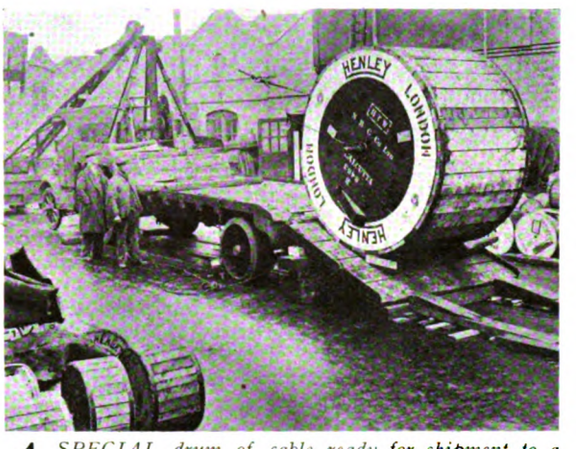
In the report on the Glasgow lighting department for the year ended May last it is stated that the total number of public lamps, gas and electric, had increased from 29 920 to 31 164. There was a reduction in the number of employees from 1 175 to 1 163, in consequence of the continued conversion of lighting from gas to electricity.

The estimate of cost of Hornsey Corporation's new sub-station in Oakfield Road amounts to £18 966. An amount is included for a balancer, and the borough electrical engineer (Mr. N. Staniland) is endeavouring to arrange with the Hewittic Electric Co. for a new type of single bulb rectifier, with change-over arrangements, to be made for the purpose.

Guildford Electricity Committee has decided to erect a transformer kiosk and lay cable at a cost of £2 082, to supply electricity to residents in the Shamley Green and Lords Hill districts.—The Central Electricity Board is in communication with the Electricity Committee regarding a bulk supply to the Hindhead and District Electric Co.—Mains are to be extended to supply residents in the Blackheath and Chilworth districts. The cost of the mains extension and a kiosk and transformer will be £2 872.

Barnsley Electricity Committee recommends that new distributing and public lighting mains be laid in the Pit Street West and Blenheim Road area, at an estimated cost of £432.—The Committee has received sanction to borrow £10 000 for hired wiring purposes.

Application is being made by the Preston Electricity Committee to the Electricity Commissioners for permission to borrow £23 000 for the erection of buildings, etc., in connection with the supply of electricity to Kirkham. Sanction has been given by the Commissioners to the borrowing of £42 000 for works in connection with the provision of additional main transmission lines between Blackpool and Preston.



A SPECIAL drum of cable ready for shipment to a colliery in India. As neither of the two winches at the colliery was suitable for this cable, W. T. Henley's Telegraph Works Co., Ltd., supplied an extra strong drum, fitted with boss plates and an accurately fitting spindle, so that the drum was actually used as a sinking drum. The cable was cleated at intervals of 20 to 25 ft. to the pump rising main, so that the actual vertical weight of cable supported by the drum at the surface was merely the weight of 20 to 25 ft. of cable.

Mr. C. H. Yeaman, city electrical engineer, has been authorised by Stoke-on-Trent Electricity Committee to negotiate for the purchase of a site for a static transformer sub-station, in connection with the change over of the supply in the Dresden area to three-phase a.c. An e.h.t. overhead line is to be erected from Greenbank Road sub-station to Fegg Hayes, for supply to the Fegg Hayes Mills, at a cost of £2 000.

The Central Electricity Board has informed Hastings T.C. of its intention to erect an overhead line from Stonestile Lane to Broomgrove power station, in connection with the South-Eastern scheme. There have been strong petitions from private residents against the proposal.—Electricity for power is to be supplied to Battle U.D.C. for three pumping stations, on an agreement for five years, with a guaranteed minimum of 40 000 kWh per annum, at 1d. per kWh, subject to an increase should it become necessary. The cable extensions will cost £1 160. The mains are also to be extended, at a cost of £1 045, to supply 28 houses at Batchelor's Bump.

The Electricity Commissioners have given formal sanction to the borrowing of £144 152 by Hull Corporation, without prejudice to the consideration of any application the Council may make for consent to change the system of supply to consumers, and on the understanding that any consents necessary to the appropriation of sub-station sites will be obtained.—The Tramways Committee has considered the question of the power station in Osborne Street, and agreement had been reached upon the technical and financial conditions of supply, but the terms quoted do not provide for the absorption by the electricity undertaking of any of the displaced staff of the tramway department. The Tramways Committee asks that the Electricity Committee definitely state its proposals relative to absorption, and that other Committees when making new appointments, consider the question of absorbing the displaced tramway staff.

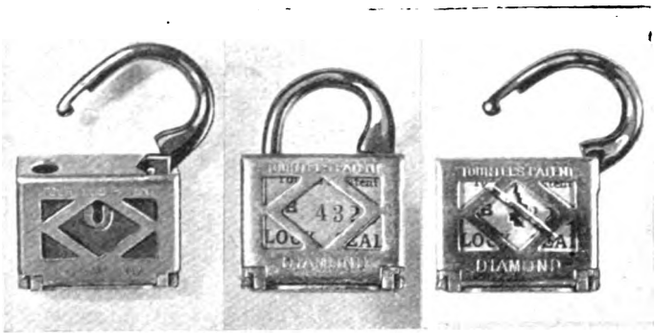
METER SEALING DEVICE.

WE have received from the TOURTEL MANUFACTURING CO., of 48, Uxbridge Road, Ealing, London, W.5, a sample of the "Diamond" type padlock for meter sealing. This lock is fitted with a hinged front which accommodates a numbered



Illustrating the meter sealing lock of the Tourtel Manufacturing Co., Ltd.

ticket covering the keyhole. Before the lock can be opened the key is required to pierce the paper ticket before it can be inserted for turning, thus indicating that the meter has been opened. Seals are available in five different colours, each seal of individual series carrying a different number. Our illustration of the unit shows on the left the lock ready for taking the seal, with the device locked and sealed in the centre; on the right the seal is broken with the key in position for opening the lock.

ELECTRIC TRACTION.

"Southern" Electrified Scheme over Sutton-Mitcham Line now Working.

ON Sunday, March 3rd, the last strip of the 875 miles of the Southern Railway system which have been undergoing conversion to electric traction was opened. Something like 14 000 additional seats have been provided by the introduction of new electric rolling stock; signalling systems have been improved; and stations have in many cases been extended. Further schemes for electrification are to be brought before the board very shortly.

London County Council Highways Committee has decided to take no further action in regard to heating the tramcars. Estimates have been prepared for an electrical system of heating, and this would involve a total initial expenditure of £56 000.

At a recent sitting of the Royal Commission on Transport, Mr. C. J. Spencer, chairman of the Tramways and Light Railways Association, said the road maintenance burden upon tramway owners had become very heavy since the advent of mechanically self-propelled road vehicles, and the road-bed, which was sufficient for rail-borne traffic, had proved inadequate to meet the added strain. In the five years, 1923 to 1927, privately owned tramway undertakings had spent over £2 000 000 on the repair and maintenance of permanent ways. In certain circumstances there was a great future for trackless trolley vehicles. It all depended on the character of the load. With a peak load they must have the largest capacity unit, and they could not have that without rails.

The conversion of one of the old-type escalators at Oxford Circus Underground station to a machine of the latest comb pattern was commenced last week. Its speed will be 100 ft. a minute compared with the present 90 ft. a minute. There are now five escalators at this station handling a daily traffic of 90 000 passengers. On the whole Underground system there are 83 escalators, of which 15 have been installed in the last twelve months.

Transport workers of the Underground companies started the New Year with an excellent batch of suggestions for improvements in the equipment and operation of the services. The number of suggestions received averages 500 a month. Those submitted in January were exceedingly good, and they included an improvement to facilitate the cleaning of steam pipes at the Chelsea power house (from a fitter), a magnetic locking device for oil pumps on the tube cars (from a fitter's mate), an electric clock to control automatically furnace doors at Chiswick overhaul works (from a fitter), improvement to omnibus driver's canopy and handle of destination sheet on single-decked vehicles (from a driver), and improvement to dash lights on trams (from a motorman).

WIRELESS NOTES.

National Radio Exhibition Poster Competition.

THE Radio Manufacturers' Association is again offering a prize of £50 for the best poster design advertising the National Radio Exhibition, 1929. In addition to the premier award, five other prizes are offered, viz., 2nd prize, £25; 3rd prize, £10; 4th, 5th and 6th prizes, £5 each.

The designs, which must be submitted by May 31st (finished rough, in colour), must be full size upright, double crown 30 in. by 20 in., and must be treated with a view to reproduction by lithography in not more than nine colours and reduction for use as poster stamps (2½ in. by 1½ in.). They should, of course, be applicable to radio, and should incorporate the following wording: "The National Radio Exhibition, Olympia (New Hall), September 23rd to October 3rd, 11 a.m. to 10 p.m. Admission 1s. 6d. daily (Tuesday, September 24th, up to 5 p.m. 2s. 6d.)." Sketches should be sent to the Secretary, The Radio Manufacturers' Association, Astor House, Aldwych, London, W.C.2.

Entries will be judged by a Committee appointed by the R.M.A. Prize winning and other selected sketches will be exhibited at the National Radio Exhibition.

It is officially reported that the Government of South Africa is withholding the licence to which the South African Wireless Telegraph Co. which works the "Beam" system in South Africa is entitled under the agreement of 1923, ratified by Parliament, provided the system is working at full efficiency. It appears that the Government proposes alterations which the company is unwilling to accept. No interruption of the service is anticipated.

It is reported that a company will shortly be formed under the name and style of the "Nederlandsch-Indische Radio-Omroep Mattschappij" (Netherlands Indian Broadcasting Company). The company will be established in Holland, and will be represented locally by two delegates. The capital required is f. 600 000, of which f. 300 000 have been promised by Messrs. Maintz and Co., Radio-Holland and the Philips group in equal shares. The main station will be built in the neighbourhood of Batavia; it is estimated that it will cost f. 400 000.

THE SOCIAL SIDE.

THE students of the Brush Electrical Engineering Co., Ltd., held their annual dance at the Town Hall, Loughborough, on February 22nd. About 120 guests attended, amongst whom were Mr. W. Johnstone, managing director, Mr. A. T. Brotherton, works director, and Mr. F. G. Healey, secretary. Mr. W. H. Cooke, chief electrical engineer, Luton Corporation, was also amongst those present. An enjoyable evening was spent, a feature being the attendance of a number of ex-students, who make this dance the occasion of an annual re-union.

The annual dinner and concert of Evershed's Social and Athletic Association was held on February 23rd, at the Clarendon Restaurant, Hammersmith. There was a good attendance under the chairmanship of Mr. Vines, president of the association. Following the dinner a very successful concert was enjoyed, with talent enlisted from the staff and works.

The committee of the Igranic Electric Company's Rugby Football Team is to be congratulated on a successful dance which was held on March 1st, at the Crofton Rooms, Bedford. Over 200 guests were present, and dancing continued until 2 a.m.

L. McMichael, Ltd., Slough, recently held their second annual dinner at the White Hart Hotel, Windsor. The seats of honour were occupied by Mr. and Mrs. L. McMichael. The dinner was followed by a dance.

The staff of the Rheostatic Co., Ltd., of Mackenzie Street, Slough, last month held a social evening, at which the managing director, Mr. L. Satchwell and Mrs. Satchwell, were present.

The staff of Messrs. James Scott and Co., electricians, Inglis Street, Dunfermline, held their annual staff dance last month.

The staff of J. H. Tucker and Co., Ltd., held a social evening on February 14th, when a dance was given at the Marshal Foch Hotel, Birmingham. The evening was thoroughly enjoyed by everyone, though it was regretted that the principals of the firm were unable to be in attendance due to indisposition in some cases and other engagements with others.

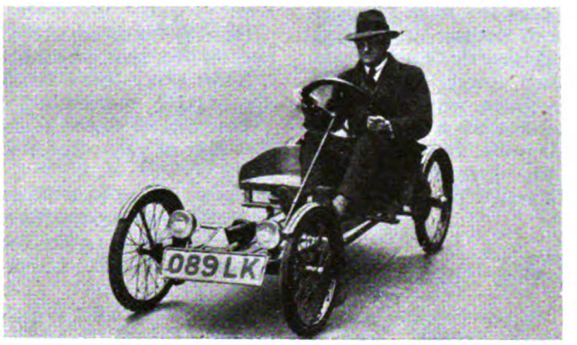
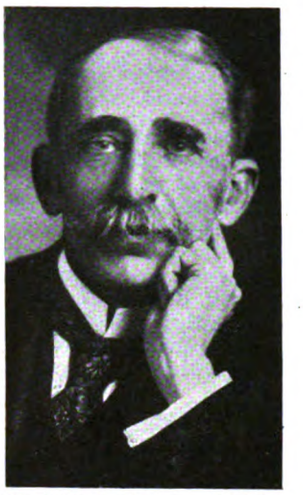
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Col. T. F. Purves, engineer-in-chief of the Post Office, whose name appears in the New Year Honours List on page 299.



Among the 'buses, cabs and other traffic of the London streets, there appeared last week this two-seater electric runabout. It is driven by a 16 V battery and is, we understand, capable of attaining a speed of 12 miles per hour.



Prof. J. A. Fleming, F.R.S., Emeritus Professor of Electrical Engineering, London, upon whom has been conferred a knighthood.

Members and guests of the Faraday House Old Students' Association and Faraday House Rugby Club, at the annual dance which was held at the Victoria Hall, London, on Tuesday.

Group taken on the occasion of the annual dinner of the Batti Wallahs' Society, at the Hotel Cecil, London, on March 1st, showing vice-presidents, together with those ladies present whose "millinery" won prizes for originality. "Admiral" H. L. Howard, the president-elect, is seen standing second from the left. Members of lower rank wore "flag" officers' caps, summer rig. Another photograph, showing the diners, is given on page 297.

COMPANY NEWS.

Manufacturers' Shares Weaker—Enfield Cable, Proposed New Capital—Marconi International Co.'s Increased Receipts—Underground Railways Improved Position—Meeting of Electrical Distribution of Yorkshire, Ltd.

THE market for electrical shares has shown all round weakness since we last wrote. General Electrics have relapsed to the tune of 7s. 6d., and at the time of writing are quoted 57s. 6d. Callender's Cable, Siemens, and Electric Construction ordinary shares are each half a crown lower, and W. T. Henley's 1s. 3d. Ever Readies have given way a further shilling to 23s., and English Electric shares at a shade over 8s. are 7½d. down. Ferranti 7% 2nd prefs. have changed hands recently at a higher level of 21s. 3d. Eastern Telegraph Stock is a point or two weaker, and Marconi's Wireless shares have lost half a crown.

CLAUD HAMILTON, LTD.—Div. for year 5%, less tax. Fwd. £6 441.

HURST, NELSON AND CO., LTD.—Intm. div. of 7½%, less tax, on ord. shs., payable on May 15.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD.—Fin. div. of 3½%, making 6% for year, is proposed.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO., LTD.—Fin. div. of 7½%, tax free, for 1928, makg. 10% (same as last year).

ATLAS LIGHT AND POWER CO., LTD.—This co. has passed a resolutn. providg. for the sale of all its holdgs. in electric supply and tractn. cos. to the American Foreign Power Co., Inc.

INTERNATIONAL LIGHTING ASSOCIATION, LTD.—Pft. for 1928, £1 270, agst. £1 077. After paying pref. div. and directors' fees, blce. is £281, transferred to special res. for div. on pref. shs.

ENGLISH ELECTRIC CO., LTD.—Directors announce that financial results of past year did not admit of paymt. of div. on pref. shs.

TOTTENHAM AND DISTRICT GAS CO.—Net rev. for 1928, £122 014, includg. £16 254 from electricity. Divs. for half-year to Dec., 1928, at rates of 5½% p.a. and 5% p.a. on pref. stks. and £6 12s. 6d. p.a. on ord. stk.

LAUNCESTON AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Rev. for 1928, £5 217, agst. £5 022; gross pft. £2 623; net pft. £1 326, plus £1 726 brt. in. To res. £600; depreciatn. £800; ord. div. for year 8%, tax free. Fwd. £1 141.

LONDON AND SUBURBAN TRACTION CO., LTD.—Divs. and int. on investmts. and loans and sundry pfts. for 1928, amt. to £55 381, increase £4 922, exes. £45 240, increase £1 007, leavg. £10 141, plus £25 996 brt. in, makg. £36 137, increase £10 141, which is carried fwd.

NORTHALLERTON ELECTRIC LIGHT AND POWER CO., LTD.—Pft. for 1928, £69 183, agst. £71 858, plus £3 209 income from investmts. To gen. res. £8 000, agst. £9 849; to benevolent fund £2 000, agst. £1 000. Fin. div. 5%, makg. 9% (same as last year); fwd. £9 690, agst. £9 910.

LIVERPOOL OVERHEAD RAILWAY CO.—Gross rev. for 1928, £97 493, workg. exes., includg. appropriatn. to res. funds. £79 610, surplus on year's workg., £17 883. Int. on deb. stk, £6 755, leaving blce. £11 127, plus £534 brt. in. Div. 5% on pref. shs. for year, payable March 14. Fwd. £3 730.

ENFIELD CABLE WORKS, LTD.—Pft. for 18 months ended Dec. 31, 1928, £142 000. Fin. div. 10%, makg. 30%. A mtg. will be held on March 20 to consider resolutns. authorisg. creatn. of 350 000 additional ord. shs. of £1 each. Directors will propose to issue 100 000 of these to existg. sh. holdrs. at 40s. per share in proportn. of two for every five held.

YORKTOWN (CAMBERLEY) AND DISTRICT GAS AND ELECTRICITY CO.—Gross pft. for 1928, £13 181. After providg. for deb. and other int., divs. on pref. shs. and stk. and intm. div. for half-year to June, 1928, blce. is £13 134. Divs. recommended at rate of 12½% p.a. on original shs., and 8¾% p.a. on additional shs., including intm. div. already paid, both less tax. Fwd. £10 421.

MARCONI INTERNATIONAL MARINE COMMUNICATION CO., LTD.—Gross rev. and receipts for 1928, £905 816, compared with £912 640. Net pft. £193 420, agst. £179 730. Investmts., £514 561, showed a decrease of £99 943, and this is mainly offset by an increase of shrs. in a foreign associated co. Intm. div. 7½% was paid on Oct. 17, 1928, and directors recommend fin. div. of 7½% for year 1928. Fwd. £36 689, increase £13 011.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON, LTD.—Rept. for 1928 shows increases of £160 170 in investmt. income and £28 782 in miscellaneous receipts, total rev. being £188 952 higher at £1 153 798. Expenditure was reduced by £11 724, to £68 277, net receipts £200 676 greater at £1 085 521. Int. on 4½% and 6% income bonds £303 496, agst. £427 279; int. on 5% deb. stk. £74 253, increase £74 253; and int. on 6% 1st cum. income deb. stk. £76 380. Fin. div. 4% on ord. shs. makg. 7% for year, compared with 5%. Fwd. £262 504, agst. £169 761.

KOLSTER-BRANDES, LTD.—This co., on Monday, invited subscriptns. for an issue of 350 000 ord. shs. at par. The co., which was incorporated on Feb. 26, 1929, to manufacture and sell apparatus and equipmt. used in connectn.

Digitized by Google

with radio, gramophone and kindred industries, has acquired the exclusive right to exploit, in the British Isles, in all British colonies and possessions, except Canada, Australia and New Zealand, and in the whole of Europe, all inventions belonging to the Kolster Radio Corporation. The co. has also acquired the entire undertakg. of Brandes, Ltd., which was incorporated in England in 1924.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD.—Net pft. for 1928, £33 569, plus £15 513. Intm. divs. paid during year at rate of 3% on 1st pref. shs. in respect of 6 mths. to June 30, at rate of 3½% on 2nd pref. shs. in respect of 9 mths. to Sept. 30, and at rate of 9d. per sh. on ord. shs. Directors propose blce. div. on 1st pref. shs., in respect of 6 mths. to Dec. 31 at rate of 3%, accrued div. on 2nd pref. shs. in respect of 3 mths. to December 31 at rate of 1¾%, makg. 5% for year, and blce. div. on ord. shs. at rate of 10·181d. p. sh., makg. standard div. for year of 1s. 7·1811d. p. sh. To special res.-ord. shhldrs. benefit under sliding scale for 1926, 1927 and 1928, £7 544. Fwd. £10 664.

GENERAL ELECTRIC CO., LTD.—An extraordinary gen. mtg. will be held on March 13 to consider and if thought fit, to pass resolutions that the capital of the company be increased to £7 600 000 by the creatn. of 1 600 000 new shs. of £1 ea.; that the new shares be called "British ord. shs" and that they be issued only subject to the conditn. that they shall not be registered in the name of or transferable to or held on behalf of any foreigner, foreign corporation, or corporation under foreign control as defined by the articles of association of the co. for the time being but that in all other respects (including participatn. in profits and surplus assets of the co. and voting rights) they rank equally with the existing ord. shs.; and that the articles of associatn. be altered accordingly.

YORKSHIRE CO.'S MEETING.

Large Increase of Consumers—Effect of National Schemes upon Charges.

THE 25th ordinary general meeting of Electrical Distribution of Yorkshire, Ltd., was held in Leeds on Tuesday, March 5th. The chairman, Mr. R. W. Wickham, said: We have again increased our list of consumers by a large number. It is interesting to know that we have actually made 15 248 new connections in the last two years.

We recently made an application for powers to supply in part of the rural district of Worksop in the county of Nottingham. The Order has been made by the Electricity Commissioners, and when it has been confirmed by Parliament the company's area of supply will be increased to 1 197 square miles, with a population of 744 000.

Our extensions are being made partly by underground and partly by overhead mains, and I want to say a word about the latter. A lot of letters have been written and protests made about the use of overhead mains in rural districts, and demands have been put forward that, although it will cost more, mains should be laid underground wherever there is a likelihoood that overhead mains would interfere with the amenities of the district. In our own area there is an average population of less than one person to the acre, and the length of mains for each consumer is proportionately greater than in urban and more densely-populated areas. To justify development, financial considerations cannot be overlooked, and to provide supply in such sparsely-populated districts it is necessary to proceed by that method which entails the least capital expenditure. The problem is not so simple as it is assumed to be. It is frequently not a choice between underground and overhead mains, but between overhead mains and no mains at all.

The scheme of the Electricity Commissioners for Mid-East England has recently been issued by the Central Electricity Board. Much has appeared in the Press about the low costs of generation under the various schemes, and there is a tendency to assume that the costs of generation which have been quoted are the prices at which electricity can be sold to the consumer. Generation is not all: the costs of distribution also must be met, and when electricity is supplied in small quantities to users spread over a thinly-populated area it cannot be expected that great reductions for small users will result because of reductions in the cost of generation.

The directors' report and accounts were adopted, and the dividend at the rate of 9%, less tax (of which 4½% was paid in August last) was approved.

COMMERCIAL INFORMATION

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ELECTRICAL INSTALLATION CO., 25, St. Mary's Road, Moseley, electrical engineers. £16 7s. December 19th.

GOWING, John Fowler, 209, Leeds Road, Huddersfield, radio contractor. £25 13s. 6d. January 17th.

MASTERMAN AND CO., LTD., R/O, Sykes Street, Castleford, electrical contractors. £13 16s. 6d. January 17th.

PARKER BROS., 135, School Road, Moseley, electricians. £22 13s. 5d. January 23rd.

ROBERTS, T., 125, Commercial Street, Batley, wireless dealer, £14 11s. 1d. January 17th.

THOMAS, H. C., Belle Vue, Tenby, radio engineer. £25 2s. 5d. December 14th.

YELDON, Gerald, 20, New Road, Portsmouth, wireless dealer. £11 14s. January 1st.

ZONE WIRELESS CO., LTD., 167, Oxford Street, W. £11 6s. 4d. January 21st.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

HAMBLING CLAPP AND CO., LTD., London, W.C., wireless manufacturers. Registered January 28th, £1,700 debenture, to W. H. Sayers, 14, Rectory Road, Beckenham; general charge. *Nil. August 12th, 1927.

LANCASHIRE TELEPHONE SYSTEMS, LTD., Manchester. Registered February 13th, series of £4,000 debentures, present issue £550; general charge. *—, January 4th, 1929.

LONDON POWER CO., LTD.—Registered February 8th, supplemental trust deed dated February 4th, 1929, securing £3 000 000; general charge. *£10 928 400. March 2nd, 1928.

PRECISION RADIO AND MANUFACTURING CO., LTD., Woking. Registered January 31st, £300 debenture, to W. C. Powers, 56, Fleet Street, E.C., paper merchant; *general charge.

REASON MANUFACTURING CO., LTD., electrical manufacturers.—Registered February 6th, mortgage to bank charged on property in Lewes Road, Brighton, etc. *£11 000. December 27th, 1927.

TRE-COIL WORKS, LTD., London, E.C., electrical engineers.—Registered February 7th, £400 debenture to Semi Freudenberger, 79, Chatsworth Road, Brondesbury; general charge.

Satisfactions.

FOOTS CRAY ELECTRICITY SUPPLY CO., LTD., London, E.C.—Satisfaction registered February 8th, £3 800 and 5% premium, registered October 20th, 1909, to January 6th, 1914.

KESWICK ELECTRIC LIGHT CO., LTD.—Satisfaction registered January 29th, £550, part of amount registered July 1st, 1901.

QUEENSWAY, LTD., London, W.C., electric light engineers,—Satisfaction registered February 8th, £300, registered May 15th, 1928.

RADIO SERVICE (LONDON), LTD.—Satisfaction registered February 13th, part of amount registered July 26th, 1927.

RANGOON ELECTRIC TRAMWAY AND SUPPLY CO., LTD., London, E.C.—Satisfaction registered February 12th, £11 042, part of amounts registered February 15th, 1906, December 31st, 1908, November 18th, 1913, and March 10th, 1924.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Satisfaction registered January 29th, £130,000, registered February 18th, 1909.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

EPOCH ELECTRICAL SOCIETY, LTD., late Gracechurch Street and Cannon Street, London, E.C., and at Manchester.—The statutory meeting of the creditors in this voluntary winding up was held on February 28th, at the offices of Linett, Hughes and Co., accountants and auditors, 24/25, Ironmonger Lane, E.C. Mr. G. Hughes, the liquidator of the company, occupied the chair, and submitted a statement of affairs which showed ranking liabilities of £2 059. The assets consisted of cash in hand and at bank £73;

Digitized by Google

book debts £267, estimated to realise £166; stock £450, valued at £150; furniture and fittings at cost £164, expected to produce £39; deposits £65, valued at £40; making a total of £470. After allowing £147 for preferential claims, the net assets were £323, or a deficiency of £1 736. The landlord had distrained prior to the liquidation and the stock had been seized. It had been offered for sale by public auction, and it was estimated that it would realise £150 to £170. The company was registered September, 1927, with a nominal capital of £1 000 and the whole of the shares were issued for cash. The company started an entirely new business, and between September 6th, 1927, and February 9th last, the turnover was £9 871, with a gross profit of £1 765. The expenses in the same period were £3 775, including salaries of £1 706, and there was a net loss of approximately £2 000. No directors' fees had ever been paid. Asked how the present position had arisen, the Chairman said he was given to understand that the company was forced to vacate its premises at an unfortunate moment, the Christmas trade being interfered with. A certain amount of price cutting had possibly taken place; when a man entered a shop to purchase a wireless set, he invariably asked for a discount, and, practically speaking, no purchaser paid the full amount. A resolution was passed confirming the voluntary liquidation of the company, with Mr. Hughes as liquidator, and an advisory committee was appointed, consisting of Messrs. C. Latham, of the Wireless and Radio Trades Guardian Association, A. Ball (Marconiphone Co., Ltd.), and R. A. Bishop (C. D. Dickeson and Sons, Ltd.). The following are creditors:—Marconiphone Co., Ltd., £142; Rolls-Caydon Sales, Ltd., £126; Phillips Lamps, Ltd., £111; Sun Electrical Co., Ltd., £105; Dickeson, C. D., and Sons, Ltd., £96; Harris and Russell, Ltd., £87.

GREENWOOD (A. I.), LTD., Guildford Street, Leeds, electrical engineers, etc. At the statutory meeting of the creditors in this voluntary winding up, the liquidator (Mr. B. Armitage) submitted a statement of affairs which showed assets estimated to realise £3 692, less £198 preferential claims, leaving a balance of £3 494 to meet debentures of £5 000, and nothing available for the unsecured creditors, whose claims aggregated £2 280. The company was registered in March, 1926, and took over the business as from the previous November. The widow of the late proprietor was allotted as purchase consideration the whole of the £6 000 shares and debentures for £5 000. During the period to September, 1926, the turnover was £3 595, with a net loss of £2 140, and in the following year there was a net loss of £2 063, on sales of £27 795. During the year to September 30th, the sales were £19 350, with a net loss of £2 433. Since September 30th last the sales had been £4 336, with a net loss of £1 176.

RUTHERFORD, Albert, electrician, Plowman's Yard, Finchley, N.W. A meeting of the creditors was held on February 27th, when a statement of affairs was presented by Hereward Scott and Co., C.A., 133, High Street, N.16, which disclosed liabilities of £735 (trade creditors £661), and net assets expected to realise £177, from which had to be deducted preferential claims of £169, or a deficiency of £566. The debtor's solicitor stated that the business was commenced just after the war, but he could not say what capital was put into it. The present position had been brought about by the debtor recently incurring a bad debt of £143. That item had been included in the list of sundry debtors and had been written off in the usual way. The accountant stated that it was impossible to prepare any proper trading accounts as the debtor's books had not been fully written up, and the time at his disposal had not enabled him to complete any investigations. An account prepared as at June 30th, 1928, showed that the stock at cost was £259, whilst there were debtors of £259. The liabilities to trade creditors at that time were £692. In reply to questions, the accountant reported that there was no offer to put before the meeting. It was decided that Mr. W. A. J. Osborne, of Corfield and Cripwell, should be appointed to investigate the matter and report to a further meeting of creditors.

London Gazette, etc.

Bankruptcy Information.

HALL, Sidney, trading as E. GREEN and CO., 13, Caledonian Road, Leeds, and 30, Leighton Lane, Leeds, electric lamp dealer. Receiving order, February 27th. Creditor's petition.

HORSFALL, Robinson, trading as HARRISON AND HORSFALL, Midland Street, Barnsley, electrical engineer. Receiving order, February 28th. Debtor's petition.

TRUSS, Thomas Frederick John, 28, Wincobank Avenue, Sheffield, electrical engineer. Receiving order, February 26th, creditor's petition.

WHEELER, Thomas Charles, 6, South Scarborough Street, West Hartlepool, Durham, electrician. Receiving order, February 25th, debtor's petition.

Bankruptcy Proceedings.

JACQUES, Roysentul, electrical engineer, 45, Woodbury Grove, Finsbury Park, London. When this debtor's name was called on the day appointed for his public examination in the London Bankruptcy Court, he failed to answer to his name, and no statement of affairs had been filed. The official receiver said that the receiving order was made on December 17 and the debtor had not surrendered to the proceedings. He had no knowledge of his whereabouts beyond the fact that he might possibly be abroad. Both the bankruptcy notice and the bankruptcy petition were served by substituted service and in these circumstances he applied for an adjournment of the public examination *sine die*, which was granted.

MULTIRAY WIRES AND ALLOYS, LTD. In this compulsory liquidation the statement of affairs shows liabilities £1 122, of which £1 103 are expected to rank, and assets £14 net, a total deficiency of £3 089 being disclosed with regard to the shareholders. The company was registered in March, 1927, with a nominal capital of £2 000 in £1 shares to take over from Thomas Brown his formula for the manufacture of nickel chrome alloy billets to be drawn into wire for use in the construction of electrical apparatus, as founders. According to the promoter, Eric Pickard, it was not the intention of the company to manufacture the wire, but to manufacture the billets and place out at contract the drawing of the billets into wire. To this end and in order to procure capital for the manufacture of the billets and the execution of other orders in foundry metal which the company might obtain, he negotiated with a Swiss metal company, but since the Multiray company was unable to demonstrate the drawing of the billets into wire such negotiations came to an end as did negotiations in other directions. As a result of an apparent misunderstanding between Pickard and Brown the company has from its inception carried on business with insufficient capital. During the negotiations with the Swiss company and afterwards the company carried on business in the manufacture and sale of castings, etc., in nickel chrome alloy and also experimented with a product in stainless iron. Some extremely good orders seem to have been obtained, but the company did not possess the capital to execute them profitably and to develop the business. An overdraft guaranteed by the directors was obtained from the bank and one of the directors advanced small sums from time to time to enable wages to be paid. A net loss of £1 019 is shown in the books of account in the carrying on of the business. Shortly before the presentation of the petition to wind up the company various judgment creditors levied execution on its effects, and on the seizure and sale the company's business came to a standstill. The failure and insolvency of the company are attributed by Pickard to the shortage of working capital occasioned by the failure of the expected arrangement with the Swiss company, the fulfilment of which was calculated to provide the company with ample capital and the source of considerable profit in the sale of the wire. In the opinion of the Official Receiver the failure is attributable to mismanagement on the part of the directors in that the working capital provided was totally inadequate, with the result that the company which was formed to acquire and place on the market a commodity manufactured from a patent formula had been handicapped throughout by a shortage of working capital.

METAL AND CHEMICAL PRICES.

TUESDAY, March 5th.

		Price.	Inc.	Dec.
Copper—

Rubber—Para fine, 1s. 1 1/4d.; plantation, 1st latex, 1s. 0 7/8d.

The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

A more hesitating tone was noticeable in the market last week, and according to James Forster and Co., after opening 5s. lower on Monday prices slowly recovered 7s. 6d., when an easier tone was again in evidence. The raising of the American quotation 15 points to 7.10 cents on Wednesday gave a small fillip to prices in London the next day.

Closing prices on March 1st were £23 15s. for March and April, and £23 16s. 3d. for May and June, 2s. 6d. and 1s. 3d. higher on the week.

EXPIRING PATENTS.

BELOW is a list of patents of interest to electrical engineers which, unless extended, will expire during 1929 :—

No.	Date (1913)	Name of Patentee.	Subject of Patent.
212	Jan. 3 ..	Turner	Casings for electrical switches.
818	Jan. 10 ..	Siemens Bros. & Co., and Pettigrew	Selecting devices for telephone circuits.
882	Jan. 11 ..	Lawson	Electricity meters.
1 182	Jan. 11 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Centrifugal air compressors.
1 600	Jan. 20 ..	British Thomson-Houston Co. and Young	Electric measuring instruments.
1 855	Jan. 22 ..	British Thomson-Houston Co. and Young	Electric measuring instruments.
1 902	Jan. 23 ..	Western Electric Co. (Western Electric Co., Belgium)	Telephone exchange systems.
1 915	Jan. 23 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Manufacture of tungsten.
2 901	Feb. 4 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Incandescent lamps.
3 271	Feb. 7 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Manufacture of material suitable for electrical insulation, etc.
3 566	Feb. 11 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Manufacture of a material suitable for electrical insulation.
4 091	Feb. 17 ..	Helm	Winding coils.
4 618	Feb. 24 ..	Western Electric Co., Ltd. (Western Electric Co. U.S.)	Selective signalling systems.
4 862	Feb. 26 ..	Gambrell	Resistance boxes, Wheatstone bridges, switches, contact makers, breakers, etc.
4 869	Feb. 26 ..	Cooper and Barlow ..	Controller for electric lifts and hoists.
5 295	March 3 ..	Marks (Landers, Frary and Clark, U.S.)	Electrically heated apparatus.
5 481	March 5 ..	Thomson (Ateliers de Constructions Electriques de Charleroi, Belgium)	Starting groups of electrical machines
6 285	March 13..	British Thomson-Houston Co. (Cie Francaise Thomson-Houston, France)	Regulation of electrical machines.
6 376	March 14..	British Thomson-Houston Co. (G.E. Co., U.S.)	Centrifugal compressors.
6 982	March 22..	Quilliam	Scaling means for boxes containing electric point controllers, switches, etc.
7 128	March 25..	Siemens Bros. and Co., and Pettigrew	Circuit arrangement for telephone exchanges with selecting devices.
7 311	March 27..	Smith and Garnett ..	Manufacture of electric cables.
7 994	April 5 ..	Chadburn's (Ship) Telegraph Co., and Howie	Speed indicating apparatus.
8 417	April 9 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Manufacture of a material suitable for electrical insulation.
8 746	April 14 ..	Irving, and British Pneumatic Railway Co.	Electro-pneumatic systems and apparatus for railway signalling.
8 821	April 15 ..	Thompson (Ges. für Drahtlose Telegraphie m.b.H., Germany)	Receiving arrangement for use in wireless telegraphy and telephony.
9 166	April 18 ..	Siemens Bros. and Co., and Christian	Observation circuits of telephone systems.
9 278	April 19 ..	Earl	Regulation of electrical installations.
10 841	May 8 ..	Railing and Garrard ..	Operating rotary converters and other a.c. machinery.
10 918	May 8 ..	British Thomson-Houston Co.	Improvements in incandescent electric lamps.
10 919	May 8 ..	British Thomson-Houston Co. and Taylor	Winding for electrical machines.
11 274	May 14 ..	Greville	Regulating electric currents passed through the human body or through electric lamps.
11 503	May 17 ..	Kelvin and James White, Field and Renfrew	Mariners' compasses.
11 623	May 19 ..	Irving and O'Donnell ..	Electrically-operated or controlled valve.
11 888	May 21 ..	Baron (Georg Hiemann, Germany)	Automatic or semi-automatic graded service telephone system.
12 162	May 24 ..	Automatic Telephone Manufacturing Co. (Automatic Electric Co., U.S.)	Telephone systems.
12 424	May 28 ..	Western Electric Co. (Franklin Tuthill Woodward, U.S.)	Machine telephone switching systems.
12 566	May 29 ..	Siemens Bros. and Co. (Siemens and Halske A.G. Germany)	Circuit arrangements for telephone systems.
13 315	June 9 ..	Otis Elevator Co. (Otis Elevator Ges. m.b.H., Germany)	Alternating current electromagnets.
13 636	June 12 ..	Marconi's Wireless Telegraph Co. and Franklin	Receivers for use in wireless telegraphy and telephony.
14 310	June 20 ..	Childs, and Reason Manufacturing Co.	Electrolytic meters.
14 423	June 21 ..	Helzelberger, and New British Ever Ready Co.	Electric lamps.
14 614	June 24 ..	Siemens Bros. and Co., and Petithory	Number dial for automatic and semi-automatic telephone.
14 796	June 26 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Motor control systems.
14 816	June 27 ..	Conner and Kahl	Electric switches.
14 892	June 27..	British Thomson-Houston Co. (G.E. Co., U.S.)	Vacuum tubes.
15 348	July 3 ..	Bey	Electrically illuminated letters.
15 579	July 5 ..	Reeves and Lundell ..	Automatic telephone exchanges.
15 636	July 7 ..	Ford	Magnetos.
15 875	July 9 ..	Ateliers de Constructions Electriques de Charleroi	Arrangements for starting groups of electrical machines.
16 040	July 11 ..	Berry	Electric heating.
16 048	July 11 ..	Faerber	Incandescent electric safety lamps.
16 208	July 14 ..	Mond (Maschinenfabrik Oerlikon, Switzerland)	Controllers for electrical apparatus.
16 428	July 17 ..	Campbell	Electro-motors for portable drilling machines.
16 753	July 21 ..	H. Aron Electricitatszahlerfabrik, g.m.b.H.	Electric meters.
17 899	Aug. 6 ..	Hirst and Brook	Switchgear.
18 018	Aug. 7 ..	Western Electric Co. (Franklin Tuthill Woodward, Belgium)	Telephone transmission systems.
18 765	Aug. 18 ..	Fessenden	Oscillatory electrodynamic apparatus for submarine signalling, etc.
18 841	Aug. 19 ..	Morcam	Applying coatings or deposits to surfaces.
19 109	Aug. 22 ..	Hancock and David ..	Plates for secondary batteries.
19 733	Sept. 1 ..	Moller	Electrically separating suspended bodies from electrically non-conducting fluids.
20 179	Sept. 6 ..	Western Electric Co. (Franklin Tuthill Woodward, Belgium)	Telephone transmission circuits.
20 195	Sept. 6 ..	W. T. Henley's Telegraph Works Co., and Bishop	Bonding clamp for metal-sheathed electric wires and cables.
20 853	Sept. 16 ..	Campbell	Electrically operated winch.
21 109	Sept. 18 ..	Hay and Sullivan	Electrical resistances.
21 646	Sept. 25 ..	Beaver and Claremont ..	Electric joint, and apparatus therefor.
21 689	Sept. 25 ..	British Thomson-Houston Co. (G.E. Co., U.S.)	Power systems.
22 198	Oct. 2 ..	St. Helens Cable and Rubber Co., and White	Connecting up cables, etc., and protection of exposed ends and terminals.
22 222	Oct. 2 ..	Lewis	Carbon electrodes for arc lamps.
22 405	Oct. 4 ..	Western Electric Co., Nash and Grace	Lamp annunciators for telephone switchboards.
23 035	Oct. 13 ..	Donovan	Replacement fuses or switches for electric circuits.
23 127	Oct. 13 ..	Norballe and Lawson ..	Motor starters.
23 449	Oct. 16 ..	Waters	Electric protective systems.
23 720	Oct. 20 ..	Jackson (Horace N. Packard)	Electrical resistances and resistance thermometers.
24 274	Oct. 27 ..	Hope	Electric fittings.
24 305	Oct. 27 ..	Akt. Ges. Brown, Boveri et Cie	Rotary converter with commutating poles.
24 337	Oct. 27 ..	Akt. Ges. Brown, Boveri et Cie	Rotary converter with commutating poles.
25 171	Nov. 4 ..	Snyder	Electric furnaces.
25 415	Nov. 6 ..	Jenkins, Pattinson and Wellesley	Electrolytic cells.
25 774	Nov. 11 ..	Western Electric Co. (Franklin Tuthill Woodward, Belgium)	Electric code impulse signalling systems.
26 361	Nov. 17 ..	Engelke and Bloodworth	Adjustable resistances.
26 635	Nov. 19 ..	Bonnella and Bonnella ..	Switches.
26 646	Nov. 20 ..	Ferguson and Johnstone ..	Voltage and output regulators for electrical machines.
26 899	Nov. 22 ..	Hatfield, and Chamberlain and Hookham)	Electrolytic measuring instruments.
27 249	Nov. 26 ..	J. Stone and Co., and Darker	Switches.
27 533	Nov. 29 ..	Automatic Telephone Manufacturing Co., and Newforth, Junr.	Telephone systems.
27 753	Dec. 2 ..	Graham	Telephone systems.
27 754	Dec. 2 ..	Graham	Telephone exchange switchboards.
28 376	Dec. 9 ..	Aitken	Telephone relays, etc.
28 527	Dec. 10 ..	Amberton	Electrical systems and switch mechanism therefor.
28 559	Dec. 11 ..	Murray	Telegraph tape transmitter.
28 746	Dec. 12 ..	Holt	Terminal pieces and contacts for circuit interrupters.
28 826	Dec. 13 ..	British Thomson-Houston Co., and Young	Alternating current meters of induction type.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by* GEE AND CO., *Patents and Trade Mark Agents, 51 and 54, Chancery Lane, London, W.C. 2, from whom further information may be obtained.

Opposition to the registration of the following trade marks can be lodged up to March 13th.

CINETROPE.—495 282. Class 8. Loud speakers and wireless telephonic receiving sets in combination with gramophones. "M.P.A." Wireless, Ltd., 62, Conduit Street, Regent Street, London, W.1 ; manufacturers. September 24th, 1928.

ATTENTOR.—496 591. Class 8. Thermostat devices. G. A. and E. S. Seddon, trading in co-partnership, 11, King Street, West, Manchester : manufacturers and merchants. November 2nd, 1928.

JUNEECO.—497 764. Class 8. Wireless telephonic apparatus and parts. A. T. Smee, trading as The Junction Engineering Co., 149a, Junction Road, Highgate, London, N. 19 ; mechanical and electrical engineer. December 5th, 1928.

FILMAVOX.—497 880. Class 8. Sound reproducing apparatus. "M.P.A." Wireless, Ltd., 62, Conduit Street, Regent Street, London, W.1 ; manufacturers. December 7th, 1928.

TRIALMO.—498 075. Class 8. Wireless telegraphy and telephony apparatus. Hyam Scott, 21a, Barbican, London, E.C.1 ; manufacturer. December 13th, 1928.

KENT'S.—491 709. Class 8. Apparatus for indicating the efficiency of turbo-generators, meters for recording readings at a distance by means of electricity, and automatic water flow regulators. George Kent, Ltd. 199 to 201, High Holborn, London, W.C.1 ; engineers. May 22nd, 1928. (To be associated. Sect. 24.) Advertised before acceptance, the applicants alleging distinctiveness.

FLUST, 496 373, and MAROG, 496 372. Both Class 50. Electric insulators and insulating boxes. Henry Peter Bayon, King's Farm, Little Shelford, Cambridge ; manufacturer. Both October 26th, 1928.

ANHYDRENE. 498 281. Class 50. Electric insulating preparations. Berry, Wiggins and Co., Ltd., Halling Works, Channelsea Road, Stratford Market, London, E.15 ; manufacturing chemists. December 19th, 1928.

Opposition to the registration of the following trade marks can be lodged up to March 20th.

TEFAG CONTINENTAL (Sign).—492 017. Class 8. Telephonic and telegraphic instruments. Telephonfabrik Berliner Aktiengesellschaft, Siemenstrasse 27, Berlin-Steglitz, Germany ; manufacturers and merchants. June 1st, 1928. (To be Associated with No. 464 149 (2 503) and others.) Registration of this trade mark shall give no right to the exclusive use of the word "Continental" or of the device of a wireless aerial.

VOLTEX (Sign).—493 844. Class 8. Electric dry batteries. Matthew Frederick Bockh, 234, Perry Hill, Catford, London, S.E.6 ; radio dealer. August 3rd, 1928. (By consent.) This trade mark is limited to the colours, blue, white and red.

SELECTA.—B493 936. Class 8. Wireless receiving sets. Selecta Gramophones, Ltd., 81, Southwark Street, London, S.E.1 ; manufacturers. August 9th, 1928. User claimed from October 16th, 1922. The applicants undertake that this mark, when registered, and the marks Nos. 390 927 and B457 869, shall be assigned or transmitted only as a whole and not separately.

STRADONELLE.—497 087. Class 8. Sound reproducing and recording instruments for use in wireless telephony and telegraphy. A. J. Balcombe, Ltd., 51, Tabernacle Street, London, E.C.2 ; manufacturers. November 15th, 1928. (To be associated with No. 388 533 (2 142) ix and another.)

PHONOTROL.—494 497. Class 8. Wireless instruments and apparatus. Igranic Electric Co., Ltd., 147, Queen Victoria Street, London, E.C.4 ; electrical engineers, August 27th, 1928. (By consent.)

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

304 882 E. R. Groie. Electric incandescent lamps and holders thereof. (13/12/27.)
304 888 T. H. Tuite. Diaphragms for use in connection with gramophone sound-boxes, and loud speaking telephone receivers, and for like purposes. (17/12/27.)
304 891 J. H. Reyner. Inductances. (22/12/27.)
283 872 Askania-Werke Akt.-Ges. vorm. Centralwerkstatt Dessau and C. Bamberg-Friedenau. Process of and apparatus for the regulation of engine and generator sets. (18/1/27.)
304 906 H. C. Hansen. Sound amplifiers for use with wireless apparatus, gramophones, and the like devices. (12/1/28.)
304 912 Soc. Italiana Pirelli, and L. Emanueli. High-tension electric cables. (20/1/28.)
304 928 Santon, Ltd., and H. C. Sanders. Electric liquid heaters. (26/4/28.)
304 933 F. H. Royce. Electrical training gear for starting internal combustion engines. (14/2/28.)
304 946 R. Ladrier. Device for replacing electric lamps on stationary fittings at any height without the use of a ladder. (15/3/28.)
304 947 Electroflo Meters Co., Ltd. (Republic Flow Meters Co.). Electrical signalling means. (19/3/28.)
304 919 W. Harrison and T. Wood. Amplification of electric currents. (22/3/28.)
304 951 E. Schrack and Dr. R. Ettenreich (trading as Radiowerk E. Schrack). Electric discharge tubes. (21/3/28.)
288 218 A. Piton. Electric current distributing and reversing devices for ringing swinging bells. (4/4/27.)
288 557 Soc. Francaise des Lampes a Incandescence Luxor. Glow lamp filaments. (11/4/27.)
304 978 Electrical Apparatus Co., Ltd., and R. H. Barbour. Electric resistances. (24/5/28.)
304 982 B. Kellermann. Electrical distant observation system with automatic control means. (5/6/28.)
293 051 P. Mourey. Time-controlled mechanisms for actuating valves and electric switches. (30/6/27.)
294 244 Akt.-Ges. Brown, Boveri et Cie. Apparatus for extinguishing back ignitions in mercury vapour rectifiers. (21/7/27.)
294 182 Keller Mechanical Engineering Corporation. Electrical control of planers and the like machine tools. (19/7/27.)
295 603 Electrical Research Products, Inc. Optical sound recording and reproducing apparatus. (21/5/27.)
295 693 Marconi's Wireless Telegraph Co., Ltd. Wireless signalling. (17/8/27.)
298 245 Siemens and Halske Akt.-Ges. Scanning mechanism for the transmission or reception of picture telegrams. (20/7/26.)
298 246 Siemens and Halske Akt.-Ges. Arrangement for the compensation of inequalities in exposure in scanning mechanism for picture telegraphy. (20/7/26.)
305 243 R. H. D. Barklie. Electric fuses. (4/11/27.)
305 160 British Thomson-Houston Co., Ltd., H. W. H. Warren, and R. G. Green. Electric heating devices. (11/9/28.)
291 042 M. Zack. Method for electric arc welding. (25/5/27.)
305 079 J. J. Rowe and C. L. Rowe. Television and other signalling-apparatus employing light-sensitive devices. (26/9/27.)

Applications for Patents.

January 21st.

2 074 Associated Telephone and Telegraph Co. Switches for telephone systems. (27/1/28, U.S.)
2 075 Automatic Telephone Mfg. Co., Ltd., and S. R. Smith. Switch mechanism for telephone systems.
2 084 H. Baron (Ateliers J. Carpentier). Telegraphic systems.
1 992 E. A. Bellow. Combined electric lamp and battery.
2 001 Brandes, Ltd. Electric condensers. (5/3/28, U.S.)
2 012 British Thomson-Houston Co., Ltd. Method of exhausting vacuum tubes. (21/1/28, U.S.)
2 047 Bullers, Ltd., and J. G. Miller. Insulators.
2 077 Bullers, Ltd., and J. G. Miller. Suspension clamps for cables.
2 073 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric discharge tubes.
1 986 V. H. Gilbert, and Radiovisor Parent, Ltd. Operating d.c. relay off a.c. supply.
2 046 F. J. Humphrey. Cable making, etc., machines.
1 966 Kelvin, Bottomley and Baird, Ltd., and F. A. King. Instrument for gauging sensitiveness of bodies to light, etc.
2 018 F. A. Kirsten. Electric immersion heaters.
2 029 M. Leff. Commutator for electric lamps.
1 962 S. Loewe. Electron tubes. (21/1/28, Germany.)
2 010 Metropolitan-Vickers Electrical Co., Ltd. Electric switches. (25/1/28, U.S.)
1 965 G. Thornton-Smith. Electric torsionmeter.
2 066 Telefunken Ges. für Drahtlose Telegraphie. Potential supply devices. (20/1/28, Germany.)
2 078 Westinghouse Brake and Saxby Signal Co., Ltd. Electrical control of railway points. (31/8/28, U.S.)
2 040 Wico Electric Co. Magnetos. (31/8/28, U.S.)

January 22nd.

2 175 J. W. Barstow. Radio apparatus, etc.
2 176 J. W. Barstow. Loud speakers.
2 185 Benjamin Electric, Ltd., and C. Campbell. Shock absorbing mounts for thermionic valves, etc. (2/7/28.)
2 186 Benjamin Electric, Ltd., and C. Campbell. Shock absorbing mounts for thermionic valves, etc. (21/9/28.)
2 120 R. V. Broberg and L. E. Wood. Operating mechanism for electric motors.
2 156 A. C. Clark. Electric junction boxes.
2 218 Fluor Light, Ltd. Electric discharge luminous tubes.
2 133, 2 134 Graham Amplion, Ltd., and W. J. Ricketts. Electromagnetic devices for recording sound.
2 098 W. Lambert. Inductor alternators for modulating carrier waves.
2 191 C. Lipmann, A. Quincha and A. Strahm (F. Strahm). Electric relays. (25/1/28, France.)
2 188 Siemens-Schuckertwerke A.G. Long distance communication cable. (23/1/28, Germany.)
2 209 Siemens-Schuckertwerke A.G. Arrangement for limited power transmission. (24/1/28, Germany.)
2 203 Soc. Technique d'Etudes et d'Entreprises pour l'Industries. Electro-magnetic apparatus for indicating positions at a distance. (1/2/28, France.)
2 097 C. L. Stokoe. Electric switches.
2 218 H. H. A. Wolfe. Electric discharge luminous tubes.

January 23rd.

2 354 Allmanna Svenska Elektriska Aktiebolaget. Arrangements for improving commutation in electric machines. (27/1/28, Sweden.)
2 404 British Thomson-Houston Co., Ltd. Vibration recording apparatus. (23/1/28, U.S.)
2 375 R. H. Cosky. Transformers.
2 347 Electrical Research Products, Inc. Acoustic devices. (31/3/28, U.S.)
2 382 Ferranti, Ltd., and S. Z. de Ferranti. Electricity meters.
2 385 Ferranti, Ltd., and S. Z. de Ferranti. Meter indicator mechanism.
2 321 F. C. Gore. Thermionic valves.
2 244 F. A. Lindemann. Photo-electric cells.
2 257 E. Longbottom and R. Milne. Electric plug and socket connectors.
2 284 R. Scott. Galvanic cells.
2 353 Siemens-Schuckertwerke A.G. Arrangements for limited power transmission. (2/2/28, Germany.)
2 328 P. D. Tyers. Electric gramophone pick-ups.
2 370 P. Wilson. Telephone instruments.

COMING EVENTS.

Friday, March 8th (To-day).

Birmingham Electric Club.—Grand Hotel. Annual dinner.
Ex-British Westinghouse Association.—Hotel Cecil, Strand, London. Annual dinner and reunion.
Institution of Electrical Engineers (North-Eastern Students' Section).—Armstrong College, Newcastle-on-Tyne. Debate on the motion "That the Electrical Industry is Moribund."
Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, Westminster. Informal meeting. Display of a collection of recent industrial cinematograph films of engineering subjects, including one on "Electro-Farming," by Mr. R. Borlase Matthews. 7 *p.m.*
Junior Institution of Engineers.—39, Victoria Street, Westminster. Chairman's address on "Road Transport." 7.30 *p.m.*
Institution of Electrical Engineers (Scottish Centre).—Cowdray Hall, Aberdeen. Faraday lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things." 8 *p.m.*

Friday, March 8th-March 23rd.

"Daily Mail" Ideal Home Exhibition, Olympia.

Saturday, March 9th.

Institution of Electrical Engineers (London Students' Section).—Visit to works of Marconi's Wireless Telegraph Co., Chelmsford. 2.15 *p.m.*
Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford on "Molecular Motions in Rarefied Gases." 3 *p.m.*

Monday, March 11th.

Electrical Contractors' Association (Hastings Sub-Branch).—Lewcock's Restaurant. Ordinary meeting.
Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting. 3 *p.m.*
Institution of Electrical Engineers (Western Centre).—Merchant Venturers' Technical College, Bristol. Paper by Mr. W. Phœnix on "Electricity in Agriculture, with Special Reference to Electro-Culture." 6 *p.m.*
Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Faraday lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things." 7 *p.m.*

Tuesday, March 12th.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers. Ordinary meeting.
Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.
Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, Leeds. Annual dinner. 7 *p.m.* for 7.30 *p.m.*
Institution of Electrical Engineers (Scottish Centre).—North British Station Hotel, Edinburgh. Paper by Messrs. Johnstone Wright and C. W. Marshall on "The Construction of the Grid Transmission System in Great Britain." 7 *p.m.*
Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, London. Paper by Capt. P. Dunsheath on "The Design of Feeder Pillars, Cable End Boxes, etc." 7.15 *p.m.*

Wednesday, March 13th.

Electrical Contractors' Association (Eastbourne Sub-Branch).—South Street. Ordinary meeting.
Electrical Association for Women.—Visit to the Ideal Home Exhibition, Olympia, London.
Polytechnic School of Electrical Engineering.—307-309, Regent Street, London. Lecture VI (Course of eight lectures) on "Picture Telegraphy" by Mr. E. S. Ritter. 5 *p.m.*
Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting. 5.30 *p.m.*
Institution of Electrical Engineers (North-Eastern Centre Students' Section).—Armstrong College, Newcastle-upon-Tyne. Joint meeting with graduates of North-East Coast Institution of Engineers and Shipbuilders. 7.15 *p.m.*
Royal Society of Arts.—John Street, Adelphi, London. Paper by Mr. R. P. G. Denman on "Loud Speakers." 8 *p.m.*
Institution of Mechanical Engineers (Sheffield Branch).—Paper by Mr. A. P. Hague on "Alloy Steels at Ordinary and High Temperatures."

Thursday, March 14th.

Institute of Transport.—Savoy Hotel, Strand, London. Annual dinner.
Institution of Mechanical Engineers.—Leeds. Paper by Mr. A. P. Hague on "Alloy Steels at Ordinary and High Temperatures."
Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.
Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.
Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting.
Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Papers by Messrs. T. N. Riley and T. R. Scott on "Electrical Insulating Papers for the Manufacture of Power Cables," and Messrs. S. G. Brown, F.R.S., and P. A. Sporing on "The Prevention of Ionisation in Impregnated Paper Dielectrics." 6 *p.m.*
Institution of Electrical Engineers (Dundee Sub-Centre).—University College. Paper by Mr. W. Woodiwiss on "Distribution." 7.30 *p.m.*
British Electrical Development Association.—Piccadilly Hotel. Annual dinner. 7 *p.m.* for 7.30 *p.m.*
Electrical Power Engineers' Association (Manchester Group).—St. Mary's Parsonage, Deansgate. Lecture by Mr. G. Cluley on "Modern Switchgear Practice." 7.45 *p.m.*

Friday, March 15th.

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. C. F. J. Morgan on "Wave-form Analysis." 6.15 *p.m.*
British Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Water Heating Developments." Speaker, Mr. M. O. F. England. 7.30 *p.m.*

Saturday, March 16th.

Association of Mining Electrical Engineers (Western Sub-Branch).—60, Wind Street, Swansea. Informal discussion of H.M. Electrical Inspector of Mines' Report for 1927.
Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford on "Molecular Motions in Rarefied Gases." 3 *p.m.*
Electrical Power Engineers' Association.—New Princes Galleries, Piccadilly, London. Dinner and dance. 7 *p.m.*

Current Topics.

The Balfour Report.

THOSE who are always on the look out for tabloid remedies for this or that commercial disorder will find little to interest them in the long-awaited final report of the Committee on Industry and Trade which has been sitting for four-and-a-half years, under the chairmanship of Sir ARTHUR BALFOUR. Happily the slogans and nostrums of the patent trade-revivers are conspicuously absent from the report, and its many pages are, for the most part, filled with observations which are well worthy of careful study as honest and serious contributions towards the elucidation of a highly complex problem. Possibly the most outstanding feature of the work is the emphasis laid throughout on the need for abolition of restrictions in many directions, and on the futility of looking to others for remedial assistance in cases where the remedy is in our own hands. There is little direct reference to the electrical industry in this report, but it will be remembered that more detailed references were contained in one of the six voluminous interim reports previously issued by the Committee. The real message for our industry seems to us to be contained in the Committee's statement that "British industries' organisation and equipment must be subjected to a thorough process of reconditioning." There is no surer or easier way of doing this than by introducing electrical equipment into the many factories and workshops which are, under present conditions, permanently handicapped by obsolete machinery and lighting. The "reconditioning" of industry will naturally lead to that increased output for which so many are striving, and there is no better aid to greater productivity than the fullest and most up-to-date usage of electrical power, a very effective indication of which was given by the Factory Lighting Campaign.

Electric Vehicles and Petrol Prices.

WHILE electrical engineers, as motorists, may share the general resentment at the big advance in petrol prices, the increase will not be without its redeeming feature if it can be used to regain public interest in the claims of the electric battery road vehicle. At present, except for town work, the private electrically-propelled car has but a poor chance of competing with internal-combustion engine propulsion, but the increased petrol prices will fall most heavily upon commercial transport, a field in which the electric vehicle is even now making some headway. Apart from the special advantages of the electrically-propelled vehicle for short haulage and delivery work, and the many other incidental advantages inherent in the electrical method, wherever applied, owners of electric vehicles enjoy complete freedom from the effects of petrol price manipulation, and can, in fact, look to a steady and progressive decrease in the cost of their "fuel," based on an increasing demand for battery charging facilities during off-peak hours. The present seems a most opportune time for a concerted effort to put more electric vehicles on the road.

Our Export Trade.

THOUGH during February our overseas trade did not maintain the improvement of the previous month, the position was better than it might at first sight appear. With a total of £55 664 975, exports were £11 214 632 less than during January, while imports valued at £91 349 354 were lower by £24 714 791. In spite of the fact that last month had one working day less than February, 1928, a comparison of the respective figures shows that during last month an average daily import trade of £3 806 223 was maintained against £3 954,000 for the same month last year, showing not only an actual but also relative decrease in imports. Similarly, exports for February, 1929, averaged £2 319 374 per working day, against £2 289 445 for February of last year, a relative increase of nearly £30 000 per day. So far as the electrical industry is concerned, the Board of Trade returns abstracted elsewhere in this issue show that exports for the month were valued at £1 462 365, or £19 837 less than the figure for February, 1928. On the other hand the total electrical exports for the two months of this year were valued at nearly £50 000 more than for the corresponding months of 1928. Imports during the month under review also increased, the amount being £28 292 or £53 633 for the two months. The month of February is always slightly misleading as to the position of the electrical export trade, in that considerable business is held up by the British Industries Fair, potential buyers withholding orders, pending decisions on conclusions formed at Birmingham. Further, many of our regular buyers have not by the end of February returned to their native

Digitized by Google

shores. These minor setbacks to February trade are with us each year, but this year, in addition, account must be taken of the extreme severity of last month's weather. The frost and snow were responsible for transport difficulties which held up some hundreds of ships, rendered railway transport in many cases almost impossible, and increased the influenza epidemic among workers. Taking all these things into account, the comparison of last month's figures with those of February, 1928, is still encouraging, and does not in any way justify regarding January's increased trade as only a temporary improvement in electrical export business.

Heating of Workshops.

A POLICE court case this week in which a firm of builders was fined for allowing the temperature of a workroom to fall below 50 deg., not only serves as a reminder of the obligations of employers, but also indicates a probable reason for many cases of deficient heating and the remedy therefor. In this workshop, as in others in which inflammable materials are stored, the owners had difficulty in settling on a safe method of heating, and not finding such a method, preferred discomfort to fire risks. In the case under notice an electric radiator heating system has now been put in, thus meeting all the requirements of comfort and safety. Electrical installation contractors will doubtless find numerous factories and workshops in their districts with a heating problem that can be solved by similar means, but without the necessity for preliminary prosecution and fine.

Reparations and British Industry.

IT will be gathered from the recommendations of the Expert Committee on German Reparations, now sitting in Paris under the chairmanship of Mr. OWEN D. YOUNG, that the attempts being made to extend the system of reparation in kind, are, if successful, likely to have a very considerable bearing on trade with our late Continental allies. Under the Labour Government in 1924, Germany was allowed, for the duration of the Dawes Scheme, to supply the allied countries with, among other products, engineering works of all kinds in lieu of cash. France, Italy and Belgium have taken full advantage of this section of the Dawes Scheme, and have encouraged dealing with Germany by allowing discounts and free trade in German goods. As an illustration of the position may be cited the fact that last year, German electrical engineering firms secured contracts on reparation account for large power station work in the Pyrenees, in addition to considerable work at docks and quays in France. Bearing in mind the fact that Germany's allied creditors can, if they so desire, divert deliveries to other countries by way of discharging their own indebtedness to other countries, this peaceful penetration, already referred to in these columns, is likely to flood those countries that matter with German products in direct but unfair competition with our own manufactures. That the true position is not altogether realised is shown by the fact that Sir JOSIAH STAMP, one of the three British delegates on the Committee, stated last week that for every ten letters received by him from correspondents desirous of making Germany pay in full, only one manufacturer expressed concern at the competition of German reparation goods. Though, perhaps, the industry most affected is that of coal, Germany is, nevertheless, a country to be reckoned with from the electrical point of view. It behoves us, therefore, not only to watch developments, but to give even more attention to overseas markets, and their needs.

Another Radio-Gramophone Fusion.

FOLLOWING the recent merger between the Victor Talking Machine Co. and the Radio Corporation of America, the official announcement that an agreement has been reached, by which His Master's Voice acquires the Marconiphone Company, is not altogether a surprise. The Gramophone Company, or in other words His Master's Voice, is controlled by the Victor Talking Machine Co., whereas the Radio Corporation of America is, in its turn, very closely associated with the Marconi Co., and though, as far as we know, neither of the gramophone companies has previously been connected with radio, important developments are expected. This latest merger confirms the opinions already expressed in these columns that the radio and gramophone industries are such that, in order to make the most of the latter, the patents, designs and methods of the former must be adopted. That this view is correct is not only confirmed by the amalgamations of recent months but by the fact that the best instruments manufactured by the gramophone companies all incorporate electric drive, amplifier circuits and moving coil loud speakers. On the other hand, the radio industry also has much to gain from the longer experience of the gramophone trade in catering for the needs of the public, its many exclusive rights of vocal and band performances—rights which have in many cases restricted the B.B.C. programmes—and the knowledge of a very considerable army of acoustical technicians. The long arm of electrical engineering stretches in all directions, and though its reach towards the gramophone industry is of long standing, at no time was it anticipated that the very heart of the trade would rest within its embrace. The development of the radio-gramophone along the lines suggested will, we feel sure, result in an instrument which will reproduce with faithfulness any composition of the full musical scale, an instrument which, at the moment, is mechanically impossible.

A New Aberdeen Story.

A TRUE story connected with the reading of the Faraday Lecture, at Aberdeen last Friday, might well be added to the host of tales centred on the Granite City. According to a reliable correspondent the now famous stocking experiment failed to work, and Mr. LL. B. ATKINSON, who was giving the lecture, attributed this to the damp northern air. A contrary view was, however, expressed by the chairman, Lord ABERDEEN, who thought that any moisture present would automatically be compensated for by the dry humour which was known to prevail in Aberdeen. It was left to Mr. D. S. MUNRO to impart to this incident the normal Aberdonian twist, and, in moving the vote of thanks, he based his regret at the failure of this attractive demonstration on the possibility that some Aberdonian might have seen in it a cheap cure for bow legs.

Railways and Electricity.

THE lukewarm interest of the big railways in electrification is so hard to reconcile with their professions of anxiety to make their systems both attractive and remunerative that we rarely look for signs of grace in this direction. At the L.M.S. annual meeting, for instance, no reference was made to electric traction, and in spite of the recent appalling accidents in which gas-lighted trains have been involved, it was complacently announced that at the present time less than one-quarter of the stock employed in the main line services is fitted with gas lighting, and that the bulk of gas-lighted stock is in use on local services or held in reserve for peak traffic or holiday periods. As many of the accidents involve local trains and excursion trains at holiday times, the retention of gas lighting is less excusable than it would be in other services where the risk of accident is less, though in any case the use of gas for the lighting of British railway trains is quite indefensible. A slightly more progressive attitude characterised the speech of the L.N.E.R. chairman, who spoke of the progress that is being made with the installation of track circuits, with which some 695 miles of track have now been equipped, and of experiments that are being undertaken with higher steam pressures and Diesel-electric locomotives, one of which is now under construction. In view of the potential importance of the Diesel-electric experiments, one is apt to wonder why it has been left to the chief mechanical engineer to carry out the work.

DETERMINING THE DISTRIBUTION OF ELECTRIC AND MAGNETIC FIELDS.

Some Interesting Experimental Methods—The Principal Qualitative Forms—Important Applications to Practical Problems.

By B. HAGUE, D.Sc., Ph.D., A.M.I.E.E., (Lecturer in Electrical Engineering, Glasgow University).

(*Concluded from page* 187.)

THE qualitative method of examining two-dimensional problems was introduced by de Sénarmont* in a research on the thermal conductivity of crystals and improved by Voigt for the same purpose. Mach has used the process to illustrate the lines of flow of an electric current in a metal plate, while Skinner has applied it to a number of interesting problems. The principle is a very simple one. Let a thin conducting plate be cut out to the shape of the region in which the field distribution is desired, the free edges of the plate corresponding to the boundaries of the field. If now the appropriate edges or other parts of the plate be maintained at differences of temperature proportional to the differences of potential found in the corresponding parts of the magnetic or electric field, it will follow, since the flow of heat in the plate fulfils the condition of continuity and the distribution of temperature satisfies the condition of zero curl, that lines of heat flow and the lines of equi-temperature (isotherms) are analogous to the lines of force and equipotentials respectively and correspond with them exactly in shape. The isotherms can be rendered visible by coating the plate with some indicating substance such, for example, as will show a sharp line of demarcation between its melted and unmelted parts or in which there are marked colour changes with change of temperature; the shape of the isotherm as it passes across the plate can be recorded from time to time. The indicator most often used is wax, or, better, a mixture of wax and elaidic acid, which possesses a sharper melting point; Skinner, however, has made use of the melting line and the oxidation colours on ordinary tinned iron plate. As a visual method the results obtained are fairly good with wax, but are necessarily rather indefinite with the use of colour-changing indicators since the passage of one colour into another is gradual. However, the second process might be made precise by photographing or observing the plate through a sharp-cut absorption filter, which would enable a clear line of demarcation, corresponding to a definite colour, to be obtained.

Electrochemical Method.

Another quantitative method was introduced by Guébhard† and is based upon an experiment described by Nobili in 1827. This observer noticed that beautiful coloured rings are produced upon the surface of a brightly polished metal plate when it is placed in an electrolytic cell in proximity to the electrodes. The phenomenon principally attracted the attention of artists who utilised it as an aid in designing coloured patterns. The dependence of these patterns upon the form and position of the electrodes, their geometric regularity, and in certain cases their obvious similarity to known mathematical curves, led Guébhard to investigate them very completely and to turn the phenomenon to account in the exploration of two-dimensional field problems. In practice the method consists in making an electrolytic cell with vertical walls rising from a plane base the periphery of which has the form of the region wherein the field is to be investigated; the whole can be easily constructed in modelling wax. Upon the base is placed a sheet of thin copper or iron, cut to the same shape as the base and fitted to meet the walls of the cell; the surface of the plate is polished. An electrolyte consisting of an aqueous solution of the acetates of lead and copper is poured into the cell, and suitable electrodes are immersed in it; the electrodes must be parallel to the cell walls and their ends should come near, but not touch, the metal plate. On maintaining the electrodes at appropriate differences of potential electrolysis takes place and beautiful iridescent deposits of lead peroxide are found on the plate. Guébhard showed both experimentally and theoretically that the curves of constant colour correspond in shape exactly with the equipotential lines of a two-dimensional electric or magnetic field in a region having the plan contour of the cell and electrodes in corresponding positions maintained at similar electric or magnetic potential differences. He examined in this way some fifty-seven two-dimensional fields for which the mathematical solutions are known, some giving diagrams of considerable complexity and beauty. As an aid in quantitative work this method, as in the case of the thermal method, might be improved by viewing or photographing the deposit on the plate through suitable colour filters.

The thermal and electrochemical methods are the principal qualitative methods worthy of mention. We may notice in passing, however, another principle which has occasionally been used, namely, Lichtenberger figures. Suitably shaped electrodes are arranged upon a photographic plate in a dark room; to these electrodes a high transient voltage is suddenly applied. Upon developing the plate the lines of force are represented by striæ extending from the position of one electrode to that of the other.*

Hydrodynamical Method.

We now come to a method, which has been used in a number of researches, utilising the fundamental properties of fluid motion. It is well-known that the motion of a perfect inviscid fluid in two dimensions is characterised by two functions, both satisfying Laplace's equation. The first function, called the stream function, expresses the stream lines or lines of flow of the fluid; the second function, called the velocity potential, expresses a system of curves cutting the stream lines orthogonally. The lines of flow are precisely analagous to lines of force in electric and magnetic fields; surfaces of constant velocity potential correspond to electric or magnetic equipotentials; the velocity of the fluid (gradient of the velocity potential) is the parallel of electric or magnetic force (gradient of the corresponding potential).

Prof. Hele-Shaw,† in carrying out some experiments, intended to show the flow of water past solids of various shapes by the expedient of injecting air bubbles into the flowing stream, noticed that there was a narrow, well-defined band at the surface of the solid within which there appeared to be true stream-line flow, i.e., where the flow resembled that in a perfectly inviscid fluid. By using thin sheets of water between glass plates and injecting fine jets of coloured fluid into the stream, the region of steady stream-line flow was increased and rendered more easily visible; a still more marked improvement was obtained when a viscous fluid such as glycerine was employed instead of water. This strange result was shown by Sir G. Stokes‡ to be in accord with the laws of hydrodynamics; in effect, he proved that the stream-lines of an infinitely thin viscous film are identical with those of the two-dimensional flow of a perfectly inviscid fluid. Hele-Shaw

and his collaborators thereupon used the method to solve a large number of hydrodynamical, magnetic and electric Laplacian fields. The field diagrams show the paths of the lines of force in a most beautiful way; many of these diagrams have been frequently reproduced in electrical engineering text-books and are well-known to engineers. It is, moreover, quite easy to obtain numerical results by the use of the method, so that it is not merely of qualitative interest.

Hele-Shaw and Hay* have investigated a number of magnetic problems including some for which the mathematical solutions are known, in order to indicate the degree of accuracy attainable. One of the particular features of the method is that by proper adjustment of the thickness of the liquid film any relative ratio between the permeability of the air space and that of the iron masses may be imitated in the hydrodynamical model; it is valuable, therefore, in depicting the refraction of the lines of induction at an iron-air interface. In their paper Hele-Shaw and Hay have, among other problems treated the field in the air-gap and teeth of a toothed armature opposite a plane pole, the iron having a permeability of 100; the flux distribution in a Siemens shuttle armature dynamo with its armature in two positions; and the flux-fringe at the tip of a pole shoe opposite a toothed core. In conjunction with Powell† these same experimenters investigated the permeance of the air-gap magnetic field of a toothed armature with open, parallel sided slots, finding results in agreement with the well-known mathematical work of Carter; while Powell‡ has determined by the hydrodynamical method the air-gap correction coefficient for semi-closed slots.

Thornton§ has used the method to find the magnetic flux distribution in the interpolar space and in the armature core of dynamos either with toothed or smooth armatures. In conjunction with Williams‖ he has made one of the earliest investigations of the electric field in three-phase cables.

Electrical Conductanee Method.

When an electric current flows in a plane metal sheet o uniform thickness from electrodes attached thereto and maintained at suitable differences of potential, the equipotential lines in the sheet have the same form as those of the two-dimensional electric (or magnetic) field produced by infinitely long parallel cylinders having the same shape of cross-section as the electrodes, maintained at corresponding potential differences, and situated in a region having a limiting boundary of the same form as the contour of the metal sheet. This analogy follows at once from the fact that the flow of current in the plate necessarily fulfils the continuity conditions; the problems are mathematically similar.

The method was introduced in 1845 by Kirchhoff¶ and applied, principally to cases where the electrodes on the plate are points (corresponding to the electric field of systems of thin parallel wires), by Smith, Adams, and by Carey Foster and Lodge. In practice the procedure consists in cutting out a thin sheet, sometimes of tinfoil but now more usually of some high resistance alloy, to the shape of the area in which the field is to be explored, soldering copper electrodes of the proper shape to the plate in appropriate positions, and then plotting out with the aid of a potentiometer, exploring needle and galvanometer, the equipotential lines upon the surface of the sheet when a direct current flows through it. The electrical resistance measured between the electrodes of the plate is proportional to the reciprocal of the capacity of the corresponding cylindrical condenser or to the reluctance of the corresponding magnetic field.

Important Applications.

The first application of the method to an engineering problem seems to have been described by Smoot,* who checked by its aid Carter's correction coefficient for open parallel sided slots in an armature. By far the most important use of the method, however, has been made by Douglas†; this experimenter has made by its aid one of the fullest investigations ever attempted of the magnetic field in a dynamo; the field was divided into two-dimension regions, which were treated partly by the theory of conjugate functions and, where that failed, by the Kirchhoff method. His paper should be consulted for full details of the experimental technique involved in determining accurate field maps and in measuring magnetic reluctance by this method.

In most experiments the plate is of thin, high resistivity material to imitate a region of air, while the attached electrodes are made of massive copper to imitate the boundary conductors in an electric field or the highly permeable iron parts in a magnetic field. Roeterink‡ has, however, imitated the influence of iron teeth of finite permeability on the correction coefficient of a slotted armature, by suitably grading the thickness or resistivity of the plate. We can show by the method, therefore, the phenomenon of refraction at the surface separating two media.

An important modification of the method, originally suggested by Adams, and used by Kennelly and Whiting,§ is to substitute for the metal plate a trough containing a liquid electrolyte and to immerse therein parallel, cylindrical electrodes of appropriate cross-sections; the two-dimensional field in the trough can then be investigated by means of an exploring electrode, which is usually a fine wire insulated except at its tip. Moreover, it is clear that the use of a liquid medium enables not only two-dimensional but also three-dimensional problems to be attacked; some progress has been made in this direction, as we shall see. Various electrolytes have been used, such as slightly acidulated or saline water, but in order to reduce to the minimum the effects of polarisation, most workers employ a solution of copper sulphate and use electrodes of pure copper. If measurements are made by means of direct current, occasional reversal of the current is resorted to in order that polarisation may be eliminated as much as possible; the detector is a sensitive galvanometer or a quadrant electrometer. In order to remove polarisation effects completely, many workers have used an alternating current, the detector being either a reflecting dynamometer or a telephone, the latter often in combination with a thermionic amplifier. The position of the exploring electrode may be determined either by the aid of co-ordinate slides and scales attached to the trough or by attaching the electrode to one limb of a pantograph; this latter device is widely used, not only in the electrolytic method, and was introduced by Fortescue and Farnsworth.

The applications of the electrolyte method to electrostatic problems are numerous and important. Förster, Atkinson and Sacchetto have all made investigations of the electric field and electric stress distribution in three-core cables.‖ The general principles of insulation design have been illustrated by the method in a paper by Fortescue and Farnsworth.¶

Three-dimension electrostatic problems are represented in the investigation by Rice* of the field of high voltage bushings, while Estorff† has examined the field of disc insulator chains and of petticoated pin insulators. Both these experimenters use the electrolyte to imitate the air region, and make a graphite paste model of the insulator to imitate the porcelain dielectric. Finally, Cramp ‡ has used the method to find the capacity of condensers having a form too complex for mathematical treatment; and Zschaage§ has examined the electric field near transmission lines and communication circuits.

By far the most thorough investigation made by the aid of the electrolyte method is that undertaken by Ahmed.‖ In a preliminary paper this experimenter tests the accuracy of the method by trying cases for which the mathematical solutions are known, and gives a very full discussion of the technique of the method. In a second paper he makes a complete examination of the magnetic leakage field of salient poles, deducing many results of practical value. Ahmed's work has put the electrolyte method on a sound basis and has established its accuracy as one of the best experimental ways of solving field problems.

The method has also been applied to the solution of aerodynamical problems by Relf¶, and to the investigation of water flow in water turbines by Hahn.**

Soap-Film Method.

We now come to an exceedingly original and interesting method first introduced by Griffith and Taylor†† following a suggestion by Prandtl. Consider a soap-film attached to some bounding edge, and let the film have a difference of pressure p between its two surfaces. Then it is shown in text books of physics that at any point on the surface of the film the condition $\frac{1}{R}+\frac{1}{R^1}=\frac{2p}{T}$ will express its equilibrium, where R and R^1 are the principal radii of curvature of the surface at the point and T is the surface tension. If the curvature is slight, and if in addition the difference in pressure between the two sides of the film is zero, the equation of equilibrium becomes $\frac{\delta^2 h}{\delta x^2}+\frac{\delta^2 h}{\delta y^2}=0$, where h is the height of the film above a datum plane in which axes of x and y have been chosen. This is Laplace's equation; hence we may take h as the analogue of potential. Lines of constant height on the film surface will correspond with and have the same shape as the equipotentials of a two-dimensional field in a region having the same shape of periphery as the plan form on the x, y plane of the hole over which the film extends. Lines of greatest slope on the film surface project on to the x, y plane in the form of lines of force; the slope of the film at any point is a measure of the electric (or magnetic) force.

The practical procedure can best be explained by a simple example. Suppose we are to find the field near an armature slot under a plane pole. Let two flat plates be prepared, one having a straight edge to represent the pole-face; the other has a straight edge in which the slot is cut. Arrange the two plates on a horizontal plane until they are in the correct relative positions to imitate the air gap contour, and then raise the pole face plate to a height h_0 above the datum plane; h_0 is then analogous to the difference of magnetic potential between the pole and the armature. The ends of the gap are closed by normal septa. A soap-film is now stretched over the space between the boundaries, clinging to the opposing straight and slotted edges, which are usually bevelled, and to the normal septa. Lines of constant height on the film, corresponding to lines of equipotential, are plotted by the use of a spherometer passing through a glass plate serving as the cover of the box in which the boundaries have been set up. The slope of the film surface, corresponding to the magnetic force, is easily measured by means of an optical clinometer.

The soap-film method was devised primarily for use in solving problems in technical elasticity, and full details of its manipulation are given in the papers cited. It is capable of high precision and is quick in use; it requires, however, not a little care and experimental skill, but the knack of dealing with the delicate films is easily acquired with practice. The writer has used the method at intervals from 1919 to the present time as an experimental aid in a long research on the magnetic and electric field, and has in preparation a description of some of the most striking and valuable results, which will be published in the near future.

Conclusion.

The preceding paragraphs will convince the reader that there are a considerable number of experimental methods which can be used by the engineer to solve his Laplacian field problem with adequate practical accuracy. Of all these methods probably the best, the most useful and the easiest to operate are the electrical conduction method, especially in the form of electrolyte tank, and the soap-film method; and in general research and under works conditions the former method is probably the most convenient. The conduction method has a further great advantage over all others in that it enables the magnetic reluctance or the electrostatic capacity to be found at once, from the result of a single resistance measurement, without the need of plotting out the field distribution.

This paper has been prepared partly to interest engineers in the many beautiful analogies existing between electric or magnetic fields and mathematically similar phenomena in other branches of physics; and partly to aid other workers by providing them with an index to the literature of the subject of field exploration by experimental means.

VARIABLE SPEED MOTORS.

At an informal meeting of the Institution of Electrical Engineers on March 4th, Mr. J. R. Bedford in the chair, Mr. L. J. Hunt opened a discussion on "Variable Speed A.C. Motors." He dealt with the various methods of speed variation by grouping the motors under the three standard types; pole-change, cascade, and commutator, all depending upon the development of the additional counter e.m.f.

Most of the motors he described are now well known and Mr. Hunt's remarks were mainly directed to the application of each type to its particular problem. He said the Scherbius method is an excellent solution of the problem, but the number of machines involves serious complications, and except for some requirements, a better solution is a single Schrage motor. The latter is very expensive, and he thought the all-round advantages were with the cascade method which is simple and robust while the speed can be changed by switching the connections on the slip rings without opening the stator circuit.

Mr. F. V. Schulthess described a new system of Scherbius regulation with a double rotor which seemed to be a development of the Spinner motor. It was a commutator motor with voltage regulation producing variable speed and power factor correction.

Mr. J. H. Johnson said if the user could manage with a pole-change he would be well advised to do so. The commutator motor had limitations of size and was expensive in cost and upkeep. He thought the advantages were often with a motor generator in spite of the space factor.

Mr. A. F. Harmer said the reason why the cost of variable speed machines was large was because the demand was so small. He believed the future would show a more extended use of single-phase than was generally anticipated.

Messrs. H. D. Barlow, J. R. Bedford, B. B. Bryan, B. M. Burt, W. A. Erlebach, A. N. D. Kerr, C. D. King, N. Prentice, E. S. Ritter, D. M. Robinson, L. E. Squire, E. O. Taylor and W. L. Wreford also spoke.

LIGHTING SERVICE.

New Facilities at E.L.M.A. Bureau Include Architectural Lighting Demonstration Room and Street Lighting Model—Moulded Glassware Fittings in Model Showroom—Forthcoming Series of Lectures on Street Lighting.

THERE can be few supply engineers or contractors who, on a visit to London, have not at some time visited the E.L.M.A. Lighting Service Bureau at 15, Savoy Street, but there are many who are unaware of the fact that this laboratory of lighting progress is continually changing, in order to reflect, and often to anticipate, the latest developments in the art of illumination.

Visiting the Bureau this week we noted a remarkable transformation, for not only has there been a re-arrangement

A view of part of the new architectural lighting demonstration room at the E.L.M.A. Lighting Service Bureau. The luminous wall panels are seen over the alcoves.

of the lighting equipment in the studios, but new demonstration rooms and apparatus have been constructed, thus adding considerably to the interest of the Bureau, and enabling it to give even greater lighting service during 1929.

The first room in which visitors are received, the re-designed reception room, is well equipped with modern fittings, including a large proportion of the new forms of pressed glassware designs. It serves to create a brighter and more cheerful atmosphere and literally says " welcome " with light.

The previous layout of the reception room was designed to represent a model electricity showroom with a rational display of domestic lighting fittings grouped into sections and displayed in connection with appropriate domestic demonstration interiors. In addition to this arrangement, various displays designed to give the visitor useful information on lighting matters were arranged in various parts of the room. In the room as reconstructed, this model showroom principle has been largely retained, since its value is considerable, both to the supply engineer and the contractor.

Luminous Roof Beams.

The centre section of the ceiling, however, has been cleared of pendant lighting fittings, and a modern architectural lighting arrangement, consisting of a rectangular system of luminous beams surrounding an effective modern lighting pendant, will be installed, and this, together with the flush showcase display of modern luminous ornaments, imparts a definitely modern character to the interior.

The four demonstration domestic interiors, comprising kitchen, dining room, drawing room, and bedroom, are considerably modified ; the modern glassware lighting fittings being incorporated in their appropriate surroundings.

With a view to giving architects and engineers facilities to study the new method of architectural lighting, the Lighting Service Bureau has inaugurated an architectural lighting department under the charge of a trained architect, whose whole time will be devoted to study and development of this subject. This department has already collected much important data on the lighting of public and domestic buildings, and the architect has designed a new lighting studio where some of the many aspects of architectural lighting are portrayed.

In its conception, the studio does not represent any particular interior, but is intended to show the effect of lighting in relation to space, and the importance of combining lighting as an intimate element in the architecture ; to this end, various systems of lighting have been incorporated.

Architectural lighting, the new line of thought in artificial illumination, is already revolutionising our conceptions of decorative lighting. The movement, which undoubtedly had its origin on the Continent, and was first described in this country in the columns of THE ELECTRICIAN, has a rapidly expanding sphere of application, and is already responsible for quite a number of striking installations in London and elsewhere.

The new architectural lighting demonstration room is, roughly, 450 ft. square, and is generally finished in pale green, the detail work being picked out in " modern " colours.

Outside the entrance of the room, symbolising the modern tendency, a distinctly novel porch fitting sheds a warm and inviting glow from its one-piece moulded glass surface.

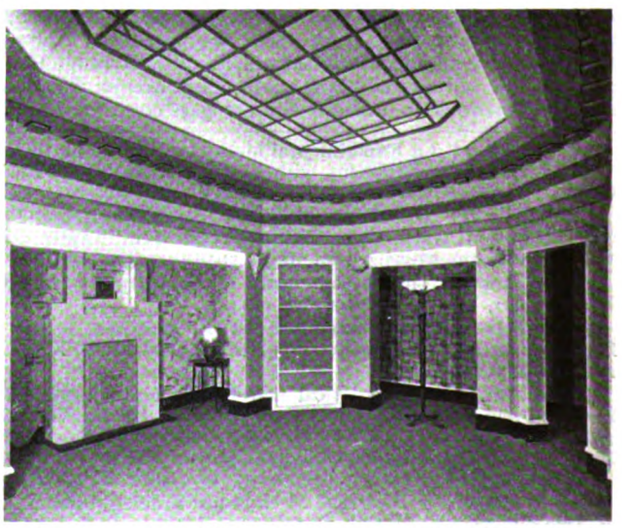
Entering the doorway, the visitor finds himself in the tiny lobby, decorated in the modern style, and lighted by a squat cylindrical fitting of warm tinted glass mounted directly on to the ceiling, while two attractive wall brackets, similar in style to the porch fitting, give additional illumination if required.

A Doorway of Light.

The main interior is reached through a low rectangular doorway which, at a touch of the switch, is transformed into a radiant frame of light by the luminous panels which form the sides of the doorway. To walk through a luminous doorway for the first time is a stimulating experience, and the visitor passes on to the main interior with a growing appetite for lighting novelty.

The main interior presents many fascinating features of a distinctly novel character. The first thing to notice is the pleasing octagonal sub-skylight which forms a large part of the ceiling of the room. Different forms of diffusing glass are employed for the sections of the skylight, which can be illuminated from above by alternative lighting systems of white and orange.

Under the skylight, and forming a strip of ceiling round the room, is a flat band which can be illuminated from concealed light sources, presenting, when the skylight is dark, an interesting feature which gives considerable character to the in-



Another corner of the architectural lighting room, an interesting feature of which is the novel treatment of the fireplace.

terior. Below this ceiling, in the form of continuous bands round the walls, are two rows of glass panels which are quite inconspicuous until illuminated, when they form two striking features which indicate the value of " built-in " lighting in imparting character to a room. Below these bands, the walls are broken into recesses, above each of which a system of

Digitized by Google

luminous lintel lighting carries out and emphasises the horizontal lines of the band lighting system.

A notable point about these systems is their inconspicuous appearance when not illuminated. They are not lighting fittings in the ordinary sense, built out from the surface, but are flush with the building line, and consequently form an integral part of the structure.

In one recess a French doorway of diffusing glass adds warmth and cheer to the room when rendered luminous by orange sprayed lamps in reflectors concealed in the background, while on each of the pillars separating the recesses, wall brackets and appliques of modern design add to the striking character of the interior. The recesses are employed to demonstrate various types of modernist pendant fittings, and also to indicate special forms of built-in lighting for shop and domestic interiors.

An interesting system of mirror lighting is shown over the fireplace, where a mirror ornamented by sand blasted designs is illuminated by two flat sheets of luminous glass set at right angles to the mirror surface.

It is the intention of the Lighting Service Bureau to develop this form of interior lighting, and by constant revision and re-arranging of this room to enable visitors who are interested in the possibilities of this new art in lighting to see for themselves the very latest practice.

A Model Street.

For some considerable time it has been the practice of the E.L.M.A. Lighting Service Bureau to employ models for demonstrating different aspects of artificial lighting. The model factory and the model retail shop are cases in point, while in the E.L.M.A. Exhibition stand, first displayed at the I.M.E.A. Convention 1928, miniature lighting demonstrations comprise the major part of the exhibit. These models possess the advantage that they can be employed where full-size demonstrations would be out of the question, due to lack of space.

Street lighting necessitates very extensive facilities if it is to be demonstrated satisfactorily, and usually requires some considerable length of private roadway; consequently, it has always been difficult to arrange effective street lighting demonstrations at the Lighting Service Bureau. The construction of a model street was, therefore, more or less a matter of course, since this field of lighting is recognised to be of considerable importance, and one which is of interest directly, or indirectly, to every member of the community.

The class of street reproduced is a first-class city street of the Kingsway type, which provides the best facilities for miniature demonstration of street lighting, while the scale of ½ in. to the foot, to which the model is built, allows the street lighting apparatus to be faithfully reproduced.

The buildings represented at the sides of the street incorporate the architecture of certain modern London buildings, which give facilities for lighting effects, and at the same time are representative of many thoroughfares.

Obviously, the number of lighting sytems which can be employed in such a model is limited, but by the use of disappearing lamp posts, five entirely different types of street lighting are available, with the additional advantage of having only one system showing at any time above the street surface.

The street length represented by the model is 215 ft., and by the use of a plate glass mirror at the end, this is made equivalent to 430 ft. The width of the street from kerb line to kerb line is 50 ft., representing an average width for a modern thoroughfare, while the pavements are 18 ft. wide.

The following five systems of street lighting are represented: Ten 12 ft. converted gas lamps on 40 ft. spacing, containing 1 lamp, equivalent to 100 W; ten 15 ft. columns on a 40 ft. spacing, carrying single pole top unit, with lamp equivalent to 200 W (5 units per side on kerb line); eight 20 ft. columns with dispersive lanterns on 50 ft. spacing, equipped with lamp equivalent to 1 000 W; eight 3-light pole top units on 20 ft. columns on 50 ft. spacing, with lamps equivalent to 300 W; three dispersive lantern units, on centre islands, with lamps equivalent to 1 000 W.

The system of switching employed in connection with the street lighting fittings enables units in each kerb line system to be controlled so that three spacing arrangements are obtained, and by this means the usefulness of the model is greatly increased, due to the comparisons which can be drawn from different spacing arrangements for any one system. No fewer than 14 different arrangements of street lighting can be demonstrated, while it is intended at a later date to instal additional experimental systems.

In addition to the street lighting itself, other lighting features are incorporated on the buildings, including lighting of the miniature shop windows, the lighting of some of the windows above the ground floor, floodlighting of the shop facades, and facilities are provided for the introduction of electrical advertising devices. By this means the model is not only rendered more valuable from a street lighting point of view, since these effects give added realism, but is also of value to those visitors not directly interested in street lighting, but more particularly concerned with lighting for shops and offices.

The model lends itself, of course, to almost endless change and extension. It is hoped, for instance, to include on the street surface model vehicles and pedestrians, while the introduction of variable street surfaces, designed to represent different road finishes under both dry and wet conditions, will increase the value of the model from a comparative point of view.

The effective model used for realistic demonstrations of street lighting. An ingenious arrangement permits the lamp standards to be changed to allow of five different types of lighting to be shown, with only one system appearing at any time above the street surface.

It is anticipated by the Lighting Service Bureau that this model will prove of very considerable value to all engaged in street lighting problems, and in particular to the non-technical members of public lighting committees.

One of the efforts which the Bureau will make during the present year will be the organisation of a series of street lighting lectures, which can now be delivered in the fascinating manner which is characteristic of all the educational work of the Bureau; every argument being backed by convincing demonstrations which accord with the Bureau slogan: "Seeing is Believing."

ELECTRICAL SALESMANSHIP.*

Developing Sales in a Small Town—Accurate Survey of Potential Users—Reaching the Local Tradesmen—Applying the "Snowball" Principle.

By "SALES MANAGER."

THE position of the manager of an electricity undertaking seems an enviable one to the man whose job it is to market a highly competitive line which is by way of being a doubtful seller, or rather a seller which needs a great deal of selling. These difficult lines are the acid test of sales-management, and it is rightly argued that a man who can put across a line which bristles with difficulties may be regarded as an "ace" of salesmanship.

The man who has the job of selling electricity has an interested potential clientéle already made for him. His customers want the many conveniences electricity can give them, and they do not use that phrase which has broken the hearts of many would-be salesmen—"Not interested."

Ready-made Interest.

Electricity grips the average man or woman with a sort of wonderment. They do not understand how it functions; they do not know positive from negative; the mysteries of amps and volts are profound to the ordinary citizen. What they do know, however, is the cleanliness and convenience of electricity; and they are willing, anxious indeed, to know more.

Let us assume that this undertaking we are using for illustration purposes has the usual competition of gas to face in its community. A long-established, well-run and courteous service is given by the gas company, and the advantages that gas claims are driven home with a steady persistence that holds gas in its position.

A certain number of customers are already on the books of the electricity undertaking, and the problem before the manager is the rapid extension of the present business. How can he best set about the job?

In the first place, he must make himself a local figure, a man who is known to all the townsfolk and a man who is a good "mixer" has a great advantage over a taciturn, slightly misanthropic individual. The ideal manager is a member of all local societies worth joining. He knows the tradespeople of the town, and he is regarded favourably by the local magnates.

During his "probation"—for that is what it amounts to—as a local inhabitant, he has caused an accurate survey of potential users to be made, and on the return he has obtained he proceeds to canvass his potential customers. He must not expect to run before he walks: he is dealing with one of the most conservative types of community we possess, and that is certainly saying something!

His showroom needs to be a place of real interest, and he can often secure valuable co-operation from other people in the town. He may one day find an opportunity for the local sewing machine people to use his window for a demonstration of hem-stitching by an electrically-driven sewing machine. I cannot imagine anything likely to interest women more than the sight of the beautiful work that is done so speedily by such means, unless it is the comfort and convenience of an electric iron, a demonstration of which can be given on another day. Then he has the opportunity of demonstrating such articles as cookers, washers, suction cleaners, etc. Possibly sales will not be over large in some of these lines, but this need not worry him, as he has a twofold purpose in view—first, certainly, selling, and, secondly, creating interest in the many manifestations of the uses to which electricity may be put.

Simultaneously with his showroom work, our manager will carry on an intensive campaign amongst the local tradesmen and residents. He will be at pains to show how electrical illumination can make the dullest shop front attractive and bring those dull back parts, which so many shops in our smaller towns possess, into active selling agency. He may go so far as to fix up a demonstration in his own showrooms, using a conglomeration of merchandise for the purpose.

The local tradesmen as a general rule are not handicapped by lack of funds, and so the advantages of electricity will not be demonstrated to an impecunious audience. Each local tradesman who adopts electricity will be a "booster" of electricity amongst his customers, and so the "snowball" principle will apply—each new user being determined to get recruits for the new "marvels," to show how wise he has been in moving with the times.

Visitors to the showroom will have been identified, and a card index of callers will have been brought into existence. Each of these obviously interested potential customers will be called upon, and close contact will be kept with those who are not immediate buyers! All the usual arguments, pro and con, will be dealt with, and by degrees there will be created a local prestige atmosphere for electricity. It will not do for Mrs. So-and-so to be ahead of Mrs. This-and-that, and a more or less friendly competition for electricity can be developed. Each buyer of an electric iron, an electric fire, an electric cooker or a suction cleaner will make others anxious not to be outdone, and the possibilities of selling equipment will be continuous so long as manufacturers continue to exercise ingenuity and imagination.

The "shyest" elements amongst the local inhabitants will need more drastic treatment. They must be circularised systematically and ingeniously, with sales-promotion matter calculated to arouse interest and create a desire for possession. Matter of this kind is not easy to define, but local interests can be used to create interest; nothing personal, of course, but local communities are very "community conscious."

All these systematised efforts sound simple enough when you read of them; but no one knows better than the writer that they are all too rarely practised. He knows so well the seeming apathy that is encountered in our smaller towns; the apparent lack of enterprise which seems to possess the local tradespeople: the scarcely veiled antagonism that appears to confront a newcomer.

But all these difficulties are more difficult in imagination than they are in fact. The undercurrent of social and civic life runs very vigorously in these smaller communities. The local tradesmen are as quick of grasp as their metropolitan or urban counterparts, and the apparent antagonism is often enough nothing more formidable than shyness.

The manager who has the right temperament can achieve both success and happiness in the peace of a country town, but he must have patience and courtesy combined with capacity for consistent hard work.

*This is the third article on this subject. Our contributor places himself in the position of the manager of a local electricity undertaking.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Electricity Supply and the Consumer."

[To the Editor.]

SIR,—Mr. H. M. Sayers seems to object to my having criticised, or made an occasion of Dr. Lulofs's recent discussion on "Domestic Tariffs." I do not know why, so I am unable to reply to his opening observation.

I am next accused of making sweeping statements. All that I intended to convey was that Dr. Lulofs, having found a workable quantity tariff, considered it wiser to abandon it in favour of a general average, whereas, in this country a large body of opinion, including Mr. Sayers, considers it a duty to afford the maximum of amenity, etc., by tariffs which approximately charge each consumer in proportion to what it costs to supply each. "That this cannot be carried out exactly is obvious and admitted."

In reply to Mr. Sayers's observation that to charge on the basis of consumption is a serious departure from equity and sound commercial principle, I would refer to the quantity tariff indicated by Dr. Lulofs.

With regard to the ordinary man's demand for "equal quantities of the same article at the same price," I suggest that the growing popularity of the rateable value system, recently approved by the Electricity Commissioners, is a sufficient answer. Under this system a consumer buys electricity for any purpose, or for use at any time, at a decreasing rate for quantity. In large power supplies a quantity tariff is extensively used. I leave it to those concerned to defend their position.

With regard to mains, I think that Mr. Sayers agrees that

Digitized by Google

it is most improper to charge on the basis of kW demand without regard to the degree of utilisation. Also management charges on the kW demand. If it is agreed that some of these heavy charges should be deleted from the kW demand charge and recovered as a charge per consumer, or per kWh sold, it is obvious that the remaining load factor element must be watered down considerably. In these circumstances it remains to be seen whether an assumed load factor, for a large number of consumers of similar quantity, say, up to 100, 500, 1 000, 5 000 20 000, 100 000 kWh per annum, etc., would not be reasonably equitable, bearing in mind the watered down load factor element of cost.

The only serious difficulty would be the change-over from the many existing forms of tariff; but if it was undertaken in easy stages by a large number of supply authorities it could no doubt be accomplished.

The present dissatisfaction, I suggest, arises more from the comparison of the charges in different areas of supply than from the consumer's estimate of the value of electricity in comparison with other agents.

For example, a 1 H.P. motor at 3d. or 4d. per kWh for small quantities would be cheap compared with manual labour, but a sudden jump from 1d. to 3d. would no doubt raise a storm of protest. It might be done if spread over four or five years.

So long as we use underground mains for l.t. distribution I think that it will be agreed that a supply cannot be given to small consumers, say, 100 kWh p.a., at anything like 4d. per kWh. If the charges all over the country were nearly double for this amount, it would still be saleable, and a more equitable charge might relieve the tax on other quantities where the competition with other agents is more acute. By such a tariff, which covers the whole range, from small consumers up to those of a million or more kWh per annum, the whole system is kept under review, which I suggest is a sounder commercial method than the mixture of tariffs on different principles, applied to various groups of consumers, which is customary to-day.—I am, etc.,

J. RUTHERFORD BLAIKIE.

29, Stanley Street,
Bedford.
March 11th.

[TO THE EDITOR.]

SIR,—Mr. Blaikie's views on the effect of load factor will not be universally accepted. Is it not witnessed, both by theory and by practice, that neglect to take into consideration this important factor will result adversely, both to consumer and to supply authority, in more cases than is convenient?

The writer has never met any fairer system than that adopted by the companies formed by the Power Development Co., as to the means by which a suitable fixed charge (in addition to the unit charge) may be arrived at for each class of consumer.

Mr. Sayers's objection to the defect of such methods—which is admitted, i.e., suspicion on the part of the consumer—can surely be met by good salesmanship, the solution, indeed, to many of our problems.—I am, etc.,

J. A. D. LAWTON.

Electricity House,
Chapel-en-le-Frith.

Steel Conductors for Power Lines.

[TO THE EDITOR.]

SIR,—The writer referred to the use of steel conductors of almost a quarter a century ago, and at a time when the grades and qualities of ferrous metals were different to those of to-day.

For a country such as this, which can hardly be excelled for the maximum amount of rust formation on metal surfaces, etc., the writer cannot very well recommend steel conductors at these times for the majority of branch rural lines.

Two of the chief reasons why they were given preference, in the early days referred to, was because the I^2R loss did not matter much due to hydro-electric excess and so forth, and the climate was a very dry one nearly all the year round. From the conductor viewpoint only, at the present time there are a few high-strength and/or high-conductivity, non-rusting and semi-ferreous and/or non-ferreous, durable and dependable factor-of-safety, composite-metal conductors. In the matter of higher strength, cadmium copper can be drawn to 50% greater tensile strength than ordinary commercial copper; cadmium copper is usually based on a standard alloy giving 60% of the conductivity of *pure* copper as against about 10 to 12 per cent. for steel often used. A conductor of aluminium-bronze is better than steel, and it may well be considered technically, etc., because of its resistance to corrosion, its high tensile strength, and its resistance to fatigue; in manufacture, it can be drawn to a tensile strength of 60 tons per sq. inch. Aluminium-bronze also compares well in weight, being less in weight than copper.

The paper by Mr. Walton has been noted. The discussion would seem to show that the factor of inductive reactance can become serious, as already mentioned. Just what this condition refers to is not mentioned in the discussion. However, based entirely on 15 000 V a.c. overhead-line operating experience of long ago, the excessive voltage drop during heavy current flow or partial short-circuit and other fault conditions differed widely from d.c. circuit conditions, etc. The ratio of resistance to reactance for steel and copper cannot be compared for the two distinct metals.—I am, etc.,

WILLIAM T. TAYLOR.

London, N.2.

Qualifications for Wireless Trade Membership.

[TO THE EDITOR.]

SIR,—Your correspondent "Quizzical" in the issue of your journal for March 8th indicates that "some of the 'dabblers' have far more technical knowledge than some of the radio retailers." The only logical inference to be drawn from this observation would be that he considers "dabblers" more entitled to trade terms than "radio dealers." If, as is to be supposed, he does not really mean this, he would not appear to be helping in the solution of an already sufficiently complicated issue.

As a matter of fact "the exception proves the rule," and there is little doubt that in the great majority of cases the position is the exact reverse of that suggested. Dealers are, indeed, continually complaining that sets constructed by the "dabbling" fraternity are constantly being brought to them to be overhauled.

He goes on to say that "the radio trade in general is at fault in not encouraging the development of its retail sales through electrical engineers." But why blame the trade, and, presumably by implication, the wireless trade associations? Surely electrical engineers started with an advantage over all others than genuine experimenters and students of wireless!

If they neglected their opportunity they cannot blame the trade associations, and certainly not the Wireless Retailers' Association, which has always encouraged the membership of *bona fide* dealers with suitable premises, adequate stock and technical knowledge. It still does, and will continue to do so.

A very considerable number of electrical engineers are already members of the W.R.A., and it welcomes all those who have definitely embarked in wireless as part of their business.

The only reasonable and practical course is for them to join the Association and help to mould their own destinies in the wireless world.—We are, etc.,

CLIFFORD AND CLIFFORD,
Hon Secretaries, The Wireless Retailers' Association.

70, Finsbury Pavement,

Telephones in China and Japan.

[TO THE EDITOR.]

SIR,—From certain statements made in the article—"Telephones in China and Japan"—which appears on page 235 of your issue dated February 22nd, it is evident that the writer is not thoroughly *au fait* with his subject.

Thus, to label the Japanese telephone authorities as unprogressive in respect of telephone system and equipment in Japan is scarcely consonant with their policy in regard to Tokyo, the chief city, already equipped with automatic telephones to the tune of some 57 000, served by 11 automatic exchanges.

Other towns similarly equipped or in process of equipment are Kyoto, 9 300 lines; Kobe, 6 700 lines; Osaka, 10 500 lines; Nagoya, 6 300 lines; and Yokohama, 12 000 lines, all operating, or shortly to operate, on the latest and most approved dial system.

Thus the automatic telephone equipment at Dairen, manufactured by this company and installed eight years ago, although marking an early appreciation by the Japanese of

Digitized by Google

the desirability of marching with the times in telephone practice, is not the largest of its kind in the Far East, as stated in the concluding paragraph of the article.

In point of fact, Japan was displaying a close interest in the Strowger dial system over ten years ago, the installation at Dairen being the first practical trial of the system on a large scale. A year later we supplied a small equipment for Teishinsho, Tokyo, the Japanese equivalent of our General Post Office.

So satisfied were the Japanese telephone authorities with these early trials that they were planning to introduce the system gradually in the capital when the great earthquake of 1923 precipitated a complete reconstruction of Tokyo's telephone service, and since that date the automatic network in the city has grown to nearly 60 000 lines, the greater portion of the equipment having been manufactured at our works in Liverpool.

Our engineers are in close and regular touch with the Japanese Telephone Administration, who display marked enterprise, and are straining every nerve to bring the telephone service of their country into line with the latest approved American and European standards.

In the circumstances, we think you will agree that the writer of the article in question scarcely does justice to a nation which is at least on a level with this country in modern telephone practice, if not in development.—I am, etc.,

For the AUTOMATIC TELEPHONE MFG., CO., LTD.
J. W. CATCHPOLE.

[We have submitted this letter to the writer of the article, who replies as follows:—" Japan had about 600 000 telephones in use in 1928 as against a population of over 65 000 000. The trouble is, there are not sufficient telephones to meet the demand, and the organisation by the Department of Communications is imperfect. In some of the larger cities the Japanese Telephone Administration has shown marked progress in recent years, but, taken as a whole, Japan is still far behind American and European standards, and when it comes to actual operation and efficiency, it cannot compare with either. In spite of the remarks your correspondent makes, I am still of the opinion that Japan would benefit by adopting the course suggested in the penultimate paragraph of my article. As regards my statement that the automatic telephone exchange in Dairen was the largest of its kind in the Far-East, a larger one may have been erected since I wrote this article, but this, as well as every statement and all statistics given in it, were carefully checked by reference to reliable reports. I spent nine years in the Far-East (China and Japan) in business."—ED.]

HOW WILL SHODDY WIRING BE STOPPED?

Wide Recognition of the Evil but no Practical Remedy Offered—Recent "Shoddy" Examples include 3 kW Fires and Electric Washers on Lampholder Adaptors.

By HARRY MOSS, A.M.I.E.E.

ALTHOUGH I am told that my articles on "Shoddy Wiring" and "Registration" have made a great impression in electrical circles all over the country, and that the photographs of shoddy work have been a means of focussing the closer attention of supply engineers and their inspectors on the work carried out for connection to their supplies, the absorbing question, "How will shoddy wiring be stopped?" is still unanswered.

During the past few weeks I have been in conversation with many representatives of the supply, manufacturing and contracting sections of the industry, and whilst everyone, without a single exception, is deeply concerned about the whole subject and would like to see an end put to the present state of affairs, not one could see how the desired result would be attained.

It will not, however, be out of place to summarise the opinions and to broadcast what is being done.

A very large manufacturer, noted for his first-class products, is intensely keen on the abolition of the "kerb-stoner" and the complete cessation of shoddy wiring, and thinks that combined action of the respective representatives of the various electrical organisations could do much to curb the evil. Manufacturers and factors, by a careful survey and analysis of their clients, with a weeding out and refusal to supply those, whom they often must know, who are not doing good work and not carrying out an electrical installation business as it should be, and the supply authorities by a much closer inspection of any installation to be connected to their supply that has been put in by a firm that is not a member of the E.C.A. or is not registered.

A central station engineer with whom I was discussing the question has made a point of having every application form carefully scrutinised and if the contractor's name that appears on it is not an E.C.A. or registered firm an inspector goes on the job every day, examines the work and materials, and when any kind of a specification has been given to the customer, sees that he gets his full value and is not "twisted" out of C.M.A. made wire, English accessories and E.L.M.A. lamps, and also keeps a careful watch on the wiring that is going out of sight, and the workmanship that is being put in. In fact, generally speaking, this engineer is a big thorn in the side of the "shoddy" firms in his district, and his efforts will either kill them and their cut-throat prices, or will be the means of improving their work to such an extent that it will be respectably good.

The factors with whom I have spoken do not want the "jerry" man or firm, but their difficulty appears to be that if the big, genuine, reliable factors do not, or will not, supply these "shoddy" firms with small parcels of goods, the same materials are obtained from other firms who call themselves factors; this is a big weakness in the electrical industry. The sooner the list of wholesalers and factors is reduced to about one-tenth of what it is at the present time, the better, as this would be the means of stopping the source of supply to the "parasites" in the contracting industry.

Other people ask why the old-established E.C.A., with its membership of reputable firms, cannot run in double harness with its younger brother, the Registration Authority, and go all out for the "elimination of the unfit" in contracting, as the E.C.A. has a power through its allied associations that the other organisation has not.

How does the "shoddy" man carry on and get the work? Simply on price. Take the following instances, which have come to my notice during the last few days: A cheap-jack man put a 3 kW radiator in a house. Did he wire up a 10-15 A plug for this? Oh, no. He put in a lampholder adaptor and plugged into a lampholder! Needless to say, trouble developed.

I, personally, was called into a house to give a price for an extension of lighting, and was told the previous contractor who had done the work was a very cheap man; he is now bankrupt, and I soon found out why. When this shoddy man added radiators to the old installation he never altered the mains and he hung his wires upon the walls like string. Needless to say, the supply authority was never informed of this extension and it has not been inspected. (I am, however, attending to this.) This prospective customer expected 150 W lighting points, each on a separate switch, complete with shade, at 10s. per point!

The automobile engineer and so-called "electrician" gets a job to fit up some new houses in his locality and uses "jerry" switches of a very doubtful quality, such as are used on some motor cars on a 6 V supply, for controlling the lights in the houses he fits up. Poor devil, he knows no better, but the genuine trade is suffering.

A few days ago one of my men found an electric washer, which has been installed 18 months working on a twin flex with a plug adaptor from a lampholder on a 230 V a.c. supply. When I reported this to the owner and notified him of the risks, he said they had had several shocks since it was installed, but he did not know that there was anything really wrong. This was another case of installation by an incompetent fool. It is now being remedied.

The following conversation on the training of "electricians" took place in a County Court a few days ago:—

BOY, TO THE REGISTRAR: "I have been learning the electrical engineering trade."
REGISTRAR: "Let me test you. What is an ampere?"
BOY: "I don't know."
REGISTRAR: "What is a short circuit?"
BOY: "I don't know."
REGISTRAR: "What did you do?"
BOY: "I painted a fence and broke up two perambulators."

In view of this, I again repeat my question: "How will shoddy wiring be stopped?"

DOMESTIC ELECTRICAL & RADIO APPLIANCES.

Brief Description of New Apparatus and Equipment—Lighting Fittings, Skirting Panel Heaters—Fountains for Use in the Home—Special Kettles for Electric Cookers—A New Radio-gramophone Instrument.

A WIDE range of "Luminia" fountains has been introduced by Messrs. PHILLIPS AND MACCONNAL, of 16, Conduit Street, London, W.1. These fountains are fashioned in bronze, are easily installed and work automatically, on a given quantity of water, that is to say there is neither inflow nor outflow. The devices produce over forty colour effects during motion.

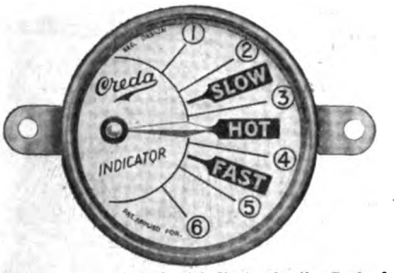
The MIDLAND ELECTRIC MANUFACTURING CO., LTD., Barford Street, Birmingham, has now introduced a larger size of their well-known "Memset" combined double pole switch and 2-way double pole fuses. The new size of this pattern is rated at 30 A and the unit makes it possible to use this very useful combination in small houses where cooking and heating is installed. Each fuse is of the same rating as the switch, so that the load may be split into any convenient values. It is pointed out by the makers that it sometimes happens that the circuits are split into lighting and heating, with practically all the capacity of the switch on one pair of fuses. Another advantage is that the larger the fuses the more effective the protection in the event of serious overload or short circuit.

A range of specially made kettles constructed to the design of Mr. J. Mould, electrical engineer of the Leicester Corporation electricity undertaking, is being manufactured by SIGG, LTD., of 469, Holloway Road, London, N. These kettles do not contain heating elements but have been so made as to exactly fit the hot-plate opening of the cookers supplied by the corporation. The kettle is of the 3-pint size, with an 8-in. diameter and is made entirely in one piece from a single circle, with a welded spout. The makers advise us that the design is for use with the products of the MANOR ELECTRIC OVEN AND FIRE CO., LTD., 305, High Road, Chiswick, London, W., and boils in about 7¾ to 8½ minutes.

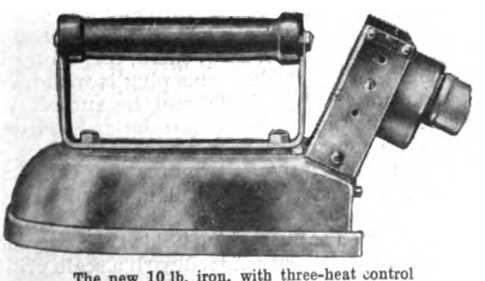
Mr. H. H. PERRY, 23, Holland Road, Kensington, London, W.14, has produced a new type of skirting heater which is intended to fill those needs where it is desired to use other than tubular, though similar, devices. The skirting panel heater is designed so that the projection from a wall will be not more than 1¼ in., and the standard lengths may be joined up as one continuous length by means of saddle covers. The heater is provided with a stout backing of heat resisting material so that only a small proportion of heat is absorbed by the wall, while the greater proportion is radiated at right angles from the wall in the direction most effective for general heating. The heating curve is much the same as with a tube, but it is claimed that the cooling extends over a longer period for the same energy consumption. Heating elements are arranged to give a 2-heat control. The series-parallel arrangement is not advocated by Mr. Perry and in the new heater a tapped series circuit is used so that the low heat can be adapted to any proportions of 100 per cent.—preferably 70 per cent. Three terminals are provided at the ends of each sectional length and are bridged across under the saddle covers where multiple lengths are used. The supply connections can be joined up at either terminal end as may be convenient, or at any of the saddle covers. The appliance is extremely simple, reliable for good insulation and inexpensive to manufacture. The standard lengths are 3, 4, 6 and 7 feet and the covers can be painted in any colour suitable to the surroundings. The heating element is run at a black heat and is therefore not subject to oxidisation. The depth of 4½ in. can easily be accommodated on most skirting.

As recently announced, PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, are introducing a comprehensive range of commercial and industrial fittings. Details are now available of some of the commercial fittings which will be known by the trade name of "Phililite." The accompanying illustration shows type D.B. which is made in two sizes suitable for 40-100 W and 100-200 W lamps respectively. Among the advantages claimed for these fittings are ease of erection, low absorption, three-ply glass being used. The chain suspension is of a new design and permits links to be removed or added for the purpose of shortening or lengthening the chain, with minimum labour and time.

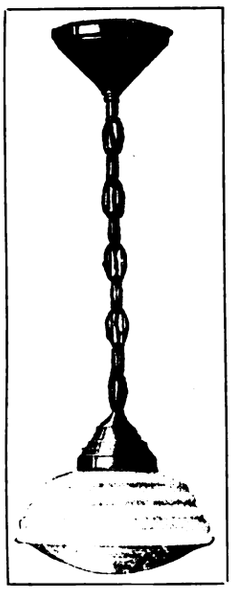
The ATTRACTA ELECTRICAL CO., 2 and 3, Tichfield Street, London, W.1, has put on the market a rotating mirror bowl for spectacular lighting effects in cinemas, dance halls, windows, etc. The bowl is made of aluminium and is studded with a quantity of small glass mirrors. The whole outfit is automatic in action and is suspended on chains to a clockwork motor which will revolve the bowl for 7 to 8 hours with one winding. Beams of white or coloured light are projected on to the bowl by means of one or more spotlight fittings which can be supplied with the bowl if desired and the reflected beams produce a pleasing colour-changing spectacle. The bowl is made in two types, A and B, with diameters of 18 in. and 24 in. respectively. Two types of projector lantern are available with 6 in. lenses, with or without a telescopic stand.



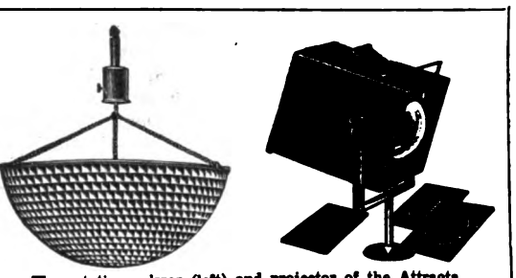
The non-mercury type heat indicator by the Credenda Conduits Co., Ltd.



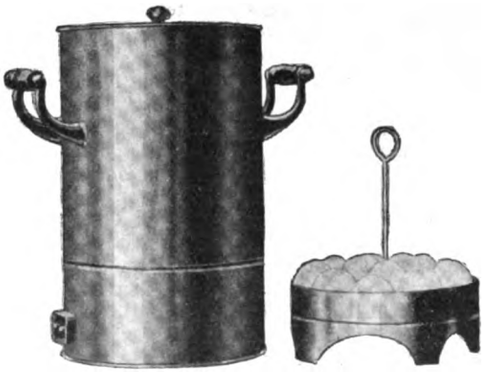
The new 10 lb. iron, with three-heat control by the Electric Heating Co.



The new type D.B. "Phililite" fitting by Philips Lamps, Ltd.



The rotating mirror (left) and projector of the Attracta Electrical Co., for dance halls, etc.



The egg boiler introduced by the Electric Heating Co., two tiers may be used if desired.

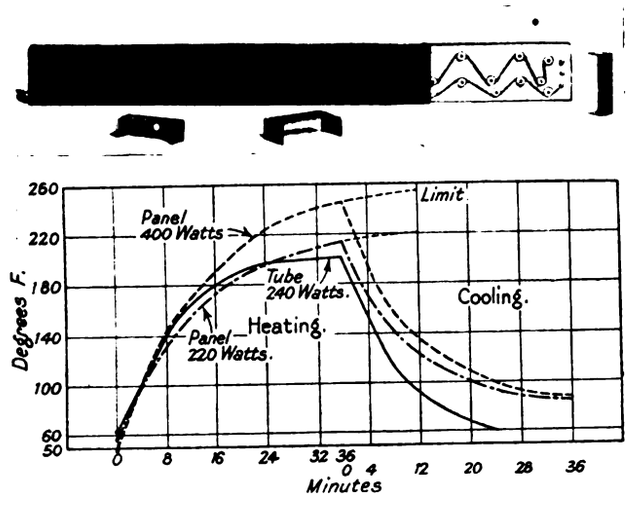
It may not be generally known that WALKER, HUNTER AND CO., LTD., Port Dominic Iron Works, Falkirk, has for some considerable time placed on the market commercial apparatus, such as electric bakers' ovens, baking plates, dough-nut cookers, fish fryers, etc. A large range of fires is also available. Referring to the bakery equipment in particular,



Above, the Perry skirting panel heater and, below, some of the efficiency curves obtained.

the ovens have many special patented features embodied in the design, while the dough-nut and fish fryers are fitted with a special lifting gear which permits of the basket being lifted and suspended directly above the pan, a considerable saving in oil thus being effected, while the cooked products are freed from surplus fat. Another product is a large grill fitted with a warming compartment situated below the grill chamber in which plates are heated on edge. This grill is fitted with a gravy drawer, the base of the grilling compartment being in the form of a chute with a draining hole in the centre through which the fats given off during the grilling, pass into the gravy drawer beneath. Above the grilling compartment another hot chamber is situated for keeping the food hot, this being heated by conduction from the grill. A large roasting oven in several types is also manufactured with the control gear mounted above the ovens. A range of hot cupboards is another line, and these are fitted with heating elements below the bottom shelf of the cupboard, also beneath the top plate which can be arranged either as a plain top or fitted with carving dishes and covers.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C., has recently placed on the market a double-pole double-break interlocked earthed pattern 3-pin switch-plug for 15 A at 250 V. This accessory, which is of robust construction, complies with the I.E.E. regulations. The switch is of the underslung type, having a long throw with rapid make-and-break, and the whole mechanism, together with socket tubes, is mounted in an English vitreous porcelain base. The dimensions of the face plate are 5 in. by 3 in. This plate is of heavy gauge brass and can be fitted either flush with the skirting board or semi-recessed with a teak surround, which is supplied as standard. The finish of the metal parts is of black bronze, but alternative finishes in polished brass, oxidised copper and oxidised silver are also available.

Among the many applications to which electricity was put at the Business Efficiency Exhibition which concluded at Olympia, London, recently, none was more prominent than that of "individual" lighting as applied to desks, etc. A large variety of suitable fittings, shades, standards, etc., was shown by the TYPERLITE COMPANY, LTD., 86, Cannon Street, London, E.C.4. In addition a number of other exhibitors showed these lamps as one of the accessories to their own particular products.

The ELECTRIC HEATING CO., of George Street, Croydon, has sent us particulars of a 10 lb. tailor's iron, having a three-heat series parallel control fitted on the iron. The loading is 200-400-800 W. The control is carried in a special box near the handle and the connecting lead is brought out at the side of the box and guarded at the exit by a special spring and insulation bush. A sliding panel is provided in the switch-box for easy access, the whole being nickel plated. The same company is marketing an egg boiler for hotels, tea rooms, etc. The normal capacity of the boiler is 8 eggs, but a 2-tier egg carrier can be supplied to bring the total capacity up to 16. The apparatus is constructed with a stout copper boiler to reduce radiation losses as far as possible, the loading being 1 000 W.

The CREDENDA CONDUITS CO., LTD., Oldbury, Birmingham, has introduced a new non-mercury type heat indicator, for use with electric cooking apparatus, but nevertheless suitable for any heating device. This indicator is claimed to be more reliable than a mercury type, less easy to break, easier to read, and is in many cases interchangeable. These indicators are made not only for "Creda" apparatus, but also for other interested manufacturers.

MAYFAIR ENTERPRISES, LTD., of 5 and 6, Cork Street, W.1, have recently given us a demonstration of the "Sonodyne" electrically amplified gramophone and wireless receiver. The instrument is made in four models. The ordinary house model consists of a simply controlled wireless receiver and electrically driven gramophone turn-table with either a G.E.C. or B.T.-H. pick-up and utilising two stages of amplification. The loud speaker is built into the cabinet and the instrument is self-contained. The concert model is similar to the house model but has a further stage of amplification. This instrument will work any reasonable number of loud speakers. The cinema model has no wireless equipment but is fitted with twin electric turntables, and change-over switch, two large capacity accumulators, and two loud speakers in plain polished baffles. The instrument is in a steel cabinet complying with Home Office requirements. It has three stages of amplification and gives sufficient volume to fill the largest picture house or dance hall. There is also a junior model without wireless but fitted with an amplifier. It has, however, a plug-in switch from which the output of a wireless receiver can be amplified. The clarity of the tone of these instruments is good and reproduction of the human voice from the ordinary gramophone record is free from background noises.

The REVO ELECTRICAL CO., LTD., Queen Street, Kingsway, London, W.C.2, has introduced a new bowl fire under the name of "Nouveau." The frame is of cast iron and adjustment is obtained by means of a back leg, the whole unit representing a departure from the more orthodox design. The overall dimensions are 14 in. wide, 14 in. high by 8 in. deep, the diameter of the bowl being 11 in. It is rated at 600 W.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C., has just brought out an improved design of watertight quick make-and-break switch. Enclosed in a strong cast iron case, this switch is operated by a solid brass pointer type side handle. A boss on the inside of the operating lever enters a machined hole in the side of the casting and keys with a spindle connected to an inside arm; these components are drawn together by a substantial screw through the gland, which is packed with tallowed hemp, thereby forming a well-lubricated watertight gland. The domed lid is fixed by two roundhead brass screws, and a rubber gasket is provided between lid and box. Two fixing lugs are provided with countersunk holes and a third lug is included into which is fixed a large sized brass round-headed screw with washer for earth connection. The convenient position of the conduit hole renders unnecessary any set or bend in the conduit.

The specially designed kettle for use with electric cookers, by Sigg, Ltd.

We have received from SANTON, LTD., samples of a 5A 3 pin plug made in accordance with B.E.S.A. specification. The design of the porcelain base is unique and, it is claimed, is capable of quenching the arc when the plug is withdrawn. The projecting sockets for each pole are the subject of a provisional patent. The pins are a special design, and being loose adjust themselves for smooth even contact.

We have received from FREDK. J. GORDON AND CO., LTD., 92, Charlotte Street, London, W.1, particulars of the "Break-not" hydrometer. This unit is fitted with a 24-in. nozzle and has a safety base of red rubber which holds the instrument in an upright position. The float is fitted with a scale printed in three colours, and is arranged with heavy glass beads to overcome the difficulty of preventing the float from sticking to the interior of the glass container.

NEWS IN BRIEF.

LEEDS Electricity Committee has decided upon the purchase of 5 000 prepayment meters.

Telegraphic transmission of pictures between Melbourne and Sydney will begin shortly.

York Education Committee is to obtain estimates for lighting the Fulford Road open-air school by electricity.

Hull Corporation has asked the City Engineer to report on the cost of operating the Drypool Bridge by electricity.

At the Temple Bar (London) telephone exchange a change has been made from the manual to the automatic system.

The Commissioners of H.M. Works, etc., have invited tenders for the erection of telephone exchanges at Leyton and Stockport.

The annual dinner of the Nottingham Branch of the E.C.A. was held on March 7th, with Mr. E. A. Harvey, president of the Branch, in the chair.

Stretford Electricity Committee is making inquiries regarding a suggested site in the Old Trafford district for the erection of electricity showrooms.

The Wiltshire County Architect has been instructed to arrange for an electric light installation at the Methuen Council Infants' School, at Corsham.

Brighton Lighting Committee recommends a scheme for assisted wiring, and has asked the engineer, Mr. John Christie, to obtain tenders from local contractors.

A film dealing with the application of electricity to agriculture was shown by Mr. R. Borlase Matthews on March 8th, at the Institution of Mechanical Engineers, London.

The British Columbia Power Corporation proposes to develop electrical energy at Campbell River Falls, Vancouver Island. It is estimated that 40 000 H.P. can be developed at this site and 75 000 by the use of Buttles Lake in Strathcona Park.

A deputation of Paisley Town Councillors recently visited Edinburgh and various English centres to study the working of automatic traffic signals, and it has now been recommended by them that a trial be given to the system in Paisley.

The first luncheon of the Leeds and West Riding Branch of the Electrical Association for Women was held at the Queen's Hotel, Leeds, on March 8th. The inaugural meeting of the Bristol and District Branch of the Association took place at Bristol Rotary House on March 5th.

A sectional meeting of the World Power Conference on the Utilisation of Water Power Resources will be held at Barcelona from May 15th to 23rd, during the Barcelona Fair. The meeting has been organised by the Spanish National Committee of the Conference. Programme, etc., from the Secretary, 63, Lincoln's Inn Fields, London, W.C.

The Minister of Transport informed the Conservative Parliamentary Agricultural Committee, last week, that the Ministry is considering the appointment of a whole-time expert to study the problems of electrical development in rural areas. Arrangements have been made for a practical experiment, based to some extent on the hire-purchase system.

The Faraday Lecture on "How Electricity does Things," was delivered by Mr. Ll. B. Atkinson on March 8th, at the Cowdray Hall, Aberdeen, to an audience limited only by the size of the hall. The Marquess of Aberdeen presided. Mr. D. S. Munro and Mr. D. M. McLeod proposed votes of thanks to the lecturer and the chairman, respectively.

The British Association has received from the City of London Court of Common Council the expression of a hope that London will be selected as the place of meeting in the centenary year, 1931, and offering entertainment to the Association in that event. This invitation has been accepted. The centenary meeting will be the first meeting of the Association ever held in London.

A new series of specially conducted tours is being arranged, under the auspices of King Edward's Hospital Fund, for London this year. The programme will open with a visit to the Regent and Gerrard telephone exchanges on March 23rd, at 2.30 p.m. After inspecting the two exchanges, the visitors will be entertained to tea. Tickets (price 7s. 6d.) may be obtained from the Secretary of the Fund, 7, Walbrook, E.C.4.

Coun. J. Stanworth, president of the National Chamber of Trade, at a recent gathering at Blackburn, expressed the view that firms who do not advertise pay for the advertising of those who do, for by the influence of good advertising many unbranded and unadvertised articles are being gradually displaced. Character, ability, knowledge and tact are essential to good salesmanship. The chief cause of failure among salesmen is lack of confidence, due to want of knowledge.

OVERSEAS TRADE.

Two Months' Exports of Electrical Goods Exceed Imports by £1 969 755.

EXPORTS of electrical machinery, apparatus and material shipped from the United Kingdom during February, 1929, amounted to £1 462 365, as against £1 482 202 during the same month last year, representing a decrease of £19 837. The total value of British electrical exports for the two months of this year amounted to £3 076 666, as compared with a total of £3 028 893 for the corresponding period of 1928, the increase being £47 773. Imports of similar goods during February last were valued at £508 816, as against £480 524 for the same month last year, an increase in value of £28 292, while for the two months of this year the total was £1 106 911, or £53 633 more than for the same period last year.

A comparison of export figures for the two months with those of imports for the same period shows an excess of exports valued at £1 969 755, while for the month of February only, the balance is £953 549. Among the export items which showed appreciable improvement during the month under review were electrical machinery other than tramway and railway motors, increase £61 972; batteries and accumulators, including parts, £41 349; and telegraph and telephone instruments, excepting wireless valves, £12 071.

We give below detailed figures for the month of February, 1929, and the two months of this year, contrasted with the figures for the same month and corresponding period of last year:—

	Month of February.		Two Months.	
Imports.	1928.	1929.	1928.	1929.

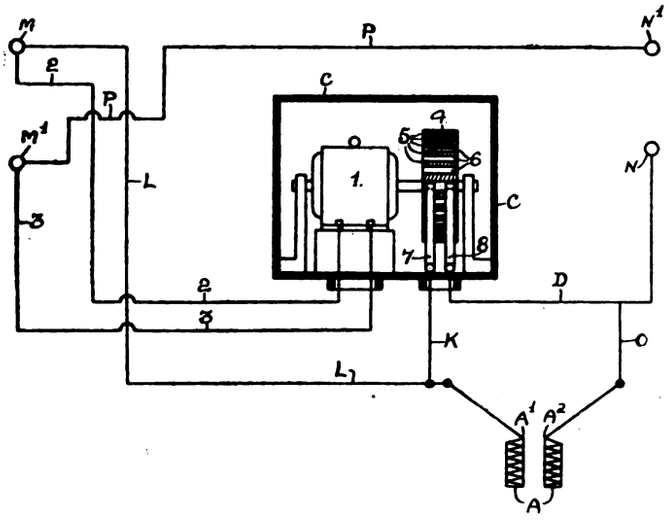
HARRISON-WOOD PATENT.

Complete Specification Now Available—The Device Described in Detail.

IN connection with the patent lodged by Mr. W. Harrison and Coun. T. Wood, for a device which, it is claimed will amplify any voltage applied across its output, Patent Specification 304 949 has now been accepted. It will be remembered that we referred to the matter, as far as we were able at that time, in our issues of November 16th and 23rd, 1928, a picture of the device also being given.

We reproduce below an illustration of the device as it appears in the specification, and a description of the patent



The theoretical arrangement of the Harrison-Wood patent.

reads as follows: "A denotes a static condenser, and C a vacuum chamber within which is disposed an electro-magnetic make and break appliance comprising a small electro-motor and a revoluble commutator with connected brushes, said commutator being coupled with the motor in any convenient manner. 1 designates the motor, which is actuated through leads, 2, 3 connected to the input terminals M, M^1 respectively. 4 generally indicates a commutator which is coupled to said motor 1 and includes brass or like segments 5 separated by insulating elements 6. 7, 8 denote commutator brushes. Said make and break device and electro-motor are sealed in said vacuum chamber C, electrical connection being made from outside said chamber with said brushes 7, 8 by means of two sealed connections K, D. Connection K associates brush 7 with lead L connecting the input circuit terminal M with terminal A^1 of condenser A. Lead D is connected to the output circuit terminal N and connection therewith is made by lead O from terminal A^1 of condenser A. Input circuit terminal M^2 is connected by lead P with output circuit terminal N^1."

ELECTRIC TRACTION.

Proposed Extensions for London Now Under Consideration.

THE London Electric Railway Co. has notified Stoke Newington B.C. that the proposed extension of the Great Northern, Piccadilly and Brompton section of the railway from Finsbury Park in a northerly direction is under consideration.

Doncaster T.C. has applied to the Ministry of Transport for permission to anticipate the sanction to the conversion of the trolley trams on the Hexthorpe route to trackless trams, in order that the necessary work may be commenced immediately owing to road widening and improvement works.

A conference of representatives of Salford Corporation and the local authorities of Eccles, Prestwich, Whitefield, and Swinton and Pendlebury, to consider Salford Corporation's proposal to establish a Tramways and Omnibus Board consisting of representatives of the Councils concerned, was held last week. The representatives of the adjoining authorities asked that Salford Corporation should withdraw its bill, which seeks protection against alleged unfair competition of motor-omnibuses. Ultimately, it was agreed that Salford should furnish to the respective authorities a copy of the evidence being taken in connection with the bill, and a draft of the terms the Corporation proposes to embody in an agreement with regard to the suggested board.

PERSONAL.

ECCLES T.C. has agreed to increase the salary of Mr. H. W. Angus, borough electrical engineer, from £850 to £900

Croydon Town Council has increased the salary of the borough electrical engineer, Mr. A. C. Cramb, from £1 500 to £1 600 per annum.

Sir Hugo Hirst was the guest of Sir Gomer Berry at a dinner at Chandos House, London, on March 5th, in celebration of his return from Australia.

Estate of the gross value of £5 680, with net personalty £4 426, was left by the late Mr. Joseph Flartey Carlisle, of the Eastern Telegraph Co., Ltd.

Sir Philip Dawson, M.P., left London for Egypt on Monday. He will advise the Egyptian Government on a number of important electrical undertakings.

Middlesbrough Town Council has referred back to the General Purposes Committee a recommendation to increase the salary of the chief engineer, Mr. R. H. Scotson, from £750 to £800 per annum.

Mr. W. A. Watson, local general manager and delegate director of the Patent Electric Shot-Firing Co., of Chesterfield, has retired. He was presented with a barometer and two cut-glass vases from the staff.

Estate of the gross value of £210 152, with net personalty of £190 497, was left by the late Mr. Alexander Thomas Hollingsworth, managing director of "Engineering" Ltd., and chairman of Weldons, Ltd.

Mr. G. Rock, general manager of the West Monmouthshire Omnibus Board, has been recommended for appointment as transport manager at Lincoln in succession to Mr. R. Hoggard, who has received a similar appointment at Chesterfield.

In a typing contest arranged by the Stenographic Department of Metropolitan Vickers Electrical Co., Ltd., Miss Helena Oldham attained the highest speed of 57 words per minute, or a total of 5 717 taps for the 20 minutes' typing, with outstanding accuracy.

Mr. Charles Erith has, owing to ill-health, resigned his position of managing director and has severed his connection with the Riley Stoker Co., Ltd. Mr. J. O. Murgatroyd, chairman and one of the originators of the company, has taken over the management of the business.

Hull Electricity Committee has placed on record its high appreciation of the manner in which Mr. C. L. Shuttleworth carried out the duties of acting city electrical engineer for a period of four months, and decided to grant him an honorarium equal to the difference between his present salary and that received by the late city electrical engineer for the four months.

The Minister of Transport has appointed Sir John R. Brooke to be an Electricity Commissioner. Sir John Brooke, who has been secretary to the Central Electricity Board since its formation, is resigning that post and will take up his new duties at once. Mr. R. H. Fox, the present solicitor of the Central Board, has been appointed to succeed Sir John as secretary. (See page 333.)

Obituary.

MR. THOMAS BLACK CALLARD, aged 82 years. He was a director of James Keith and Blackman Co., Ltd.

MR. CLARENCE HUGHES COPE, aged 84 years. He had for over 35 years been on the staff of Fraser and Chalmers.

SIR JOHN DENISON-PENDER, on March 6th, aged 73 years, chairman of the Eastern Telegraph Co., Ltd., and associated companies. Sir John was the third son of Sir John Pender (1815-96), one of the pioneers of submarine telegraphy. Sir John Denison-Pender commenced his career with the Eastern Telegraph Co. and its associates in 1878. In 1881 he was made a director of the Eastern Company, and 12 years later was appointed managing director, a position which later he held in conjunction with Rear-Admiral H. W. Grant. In 1896, the year of his father's death, he was made deputy-chairman, and in 1917, on the death of Sir John Wolfe Barry, he became chairman, his son, Mr. J. C. Pender, succeeding him as managing director. In the South African War he exerted himself to the utmost in the national cause, and was created K.C.M.G. for his services, an honour which had been conferred on his father in 1888. The problem of the cables was naturally more complicated in the last war, and to Sir John was largely due, not only the maintenance intact of our great network of cable communication, but also the cutting off of the enemy's services. (See page 333.)

BUSINESS ITEMS.

THE WALSALL HARDWARE MANUFACTURING CO., LTD., has opened a new Sheffield branch at 39, Arundel Street.

Mr. E. DANIEL HASBERRY, radio engineer, of Aylesbury, has removed his business to new premises in Temple Street.

The address of BERRY, WIGGINS AND CO., LTD., has been changed to Tensulam House, Water Lane, Stratford, London, E.15.

EINSTEIN'S ELECTRO-CHEMICAL PROCESS, LTD., have acquired offices at Cockpit House, 36/38, Queen Street, Westminster, London, S.W.1.

C. A. VANDERVELL AND CO., LTD., Acton, London, W.3, has issued a special battery window display for service agents and traders throughout the country.

The BRITISH ALUMINIUM CO., LTD., has opened a new branch and warehouse at 66, Kirkstall Road, Leeds, under the management of Mr. C. F. Batstone.

In connection with the pictorial impression of the North East Coast Exhibition published in our issue of February 22nd on page 243, the LONDON ELECTRIC FIRM announces that the two searchlights will be a joint loan with C. A. PARSONS AND CO.

A. F. A. ACCUMULATORS, LTD., announce that the business which they have been carrying on in connection with Varta accumulators, A. F. A. storage batteries for house lighting, etc., and Pertrix dry batteries, has now been taken over by PERTRIX, LTD., of 120, Tottenham Court Road, London, W.1.

The new telephone exchange for the Norbury (London) area, which was opened on February 27th, is fitted with a No. 10 type switchboard with accommodation for 1 900 subscribers' lines, supplied by SIEMENS BROTHERS AND CO., LTD., of Woolwich. It will serve the area until the new automatic director exchange is completed.

We are advised by ATTWOODS SPRAYING EQUIPMENT, LTD., 76/78, Kensal Road, London, W.10, that they are exhibiting at the Oil and Colour Trades Exhibition, which opens at the Royal Agricultural Hall, London, to-morrow (Saturday). A special feature is being made of demonstrating the use of spraying equipment in the electrical and engineering industries.

The "Golden Arrow," with which Major H. O. D. Segrave attained a speed of 231·26 m.p.h. on Monday, is fitted with B.T-H. magnetos. It is interesting to note that similar magnetos were used on the cars with which Capt. Malcolm Campbell and Major Segrave obtained world's speed records in 1927 and 1928, and are fitted to the motor boat "Miss England."

Mr. A. J. Pack, the commercial secretary in the United States, will shortly visit this country on official business. Mr. Pack will be available as from March 18th for the purpose of interviewing representatives of United Kingdom firms interested in the export of British goods to the United States. Application for interviews in London should be addressed to: The Comptroller-General, Department of Overseas Trade, 35, Old Queen Street, London, S.W.1, quoting the reference, 12 796/1.

The merging of MARCONI'S WIRELESS TELEGRAPH CO., LTD., and the EASTERN TELEGRAPH CO., LTD., has involved the acquisition of fresh premises capable of housing a joint concern of this magnitude, with the result that the leaseholds of Electra House (61 850 sq. ft.), Tower Chambers (16 200 sq. ft.) and Marconi House (53 000 sq. ft.) which have hitherto held the headquarters of the two companies, are now available for purchase. Messrs. Knight, Frank and Rutley, 20, Hanover Square, London, W.1, are the sole agents.

In connection with the contracts placed by the Central Electricity Board and referred to on page 330, BRITISH INSULATED CABLES, LTD., Prescot, Lancs, advise us that their portion of the order is for the supply and laying of approximately 90 miles of single cable for 66 000 V working, 30 miles of three-core cable for 33 000 V working, and 15 miles of auxiliary cables. The approximate value of the order is £350 000. These cables will be laid in the following London districts, the total length of route being 25 miles: Islington to St. Pancras; St. Pancras to St. Marylebone; Poplar to West Ham; Willesden; West Ham to link up with proposed overhead lines from Barking; East Ham to link up with West Ham to Barking cables; Kidbrooke to Woolwich; Fulham to Wandsworth; Battersea; Wimbledon to Kingston. Well over 1 000 joints will be necessary, and the following are approximate weights of metal involved: 500 tons electrolytic copper; 1 500 tons lead; and 250 tons galvanised steel wires. The first portion of the order must be ready for work by the end of September, 1929, and the whole contract to be completed by September, 1931.

IN PARLIAMENT.

The Galloway Water Power Bill Before Select Committee in the House of Lords.

A SELECT Committee of the House of Lords began consideration of this Bill on March 5th. Mr. H. P. Macmillan, K.C., for the promoters, said it was proposed to incorporate the Galloway Water Power Co. The real promoters were certain directors of the Power and Traction Financial Co., Ltd., and Mr. R. M. Brand (of Lazard Bros.), Major Wellwood Maxwell, Mr. Jas. M'Queen, and the Earl of Stair. The scheme was estimated to cost £2 770 000. It was proposed to erect generating stations in the county of Kirkcudbright, and to use the water power of the Dee, certain waters of Loch Doon and the water of Idet. The scheme would fit into the Central Electricity Board's scheme. There would be five stations, with an aggregate capacity of 102 000 kW.

Col. W. McLellan (Merz and McLellan) gave evidence in support of the scheme.

The development of the area on the footing of a continuous load would be uncommercial. It was not capable of being developed as a self-contained station, because of the amount of storage required. The scheme was one for collecting one day's water for another day. The peak load thus provided would be developed to work in conjunction with the grid. The scheme was capable of producing 188 000 000 kWh per annum at a cost of under ⅛d. per kWh.

Sir Alexander Gibb said ten reservoirs were contemplated in the scheme.

Opposition by certain millowners was withdrawn. Mr. J. Williamson, chief engineer to Sir Alexander Gibb and Partners, and Mr. Matthew Duff, civil engineer, gave evidence in favour of the scheme. Lord Meston said he was satisfied that there would be no difficulty in getting the necessary finance. Mr. Arthur Collins, financial expert, and Mr. W. Robertson, valuer, also gave evidence. Sir Alexander Walker, vice-chairman of the Ayrshire Electricity Board, also supported the scheme. Mr. Carmont, K.C., on behalf of the Ayrshire County Council and Ayr burghs, protested against the scheme, on the ground that Ayrshire would be deprived of water from the Clyde watershed, while Kirkcudbrightshire would get the benefit in increased rates.

Mansfield District Traction Bill.

A Select Committee of the House of Lords began consideration of this Bill on March 5th.

Mr. Wrottesley, K.C., for the promoters, said the undertaking was subject to purchase by the local authorities, providing they purchased it as a whole, if they gave notice of intention to purchase within six months from May 13th, 1931. This was if the local authorities all agreed. The company seeks powers to substitute trolley vehicles, and on some routes omnibuses, for the trams, and to change the name of the company.

Evidence was given by Col. Sir Joseph Nall, M.P., chairman of the promoting company. He said it would be unreasonable that the railway companies should expect to compete with the tramway company's local services. The proposal in the Bill to extend until 1959 the option of purchase of the undertaking was a reasonable one.

Mr. O. C. Park (Trent Omnibus Co.) said the protection for which the promoters asked would result in serious loss to the revenues of his company.

The Chairman announced that the Committee had decided that the promoting company could have a monopoly, so far as the taking up or setting down of passengers was concerned, on the routes on which their tramlines were already laid, and on the extensions which were being authorised by this Bill. They did not give the same privilege to the route to Clipstone and Blidworth. Other companies would have the right to carry passengers out to districts beyond the limit of the company's working, and equally to set down passengers coming in from outside, but they must not compete with the local traffic. The period for the completion of the trolley vehicle equipment was reduced to three years. The preamble of the Bill was passed.

The Minister of Transport states that so far as his Department and the Electricity Commissioners are concerned, all possible steps will continue to be taken to expedite the supply of electricity to rural areas. The whole of the London area, with the exception of a few parishes in the south, is either already covered by statutory powers for the supply of electricity or by applications which are now before the Commissioners for such powers.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

ATHERTON URBAN DISTRICT COUNCIL.—Supply of one e.h.t. switch cubicle. Specification, etc., from the Electricity Department.

BECKENHAM URBAN DISTRICT COUNCIL.—Supply of l.t. feeder pillars. Particulars from the Engineer and Manager, Electricity Department, 45, High Street, Beckenham.

EDINBURGH WELFARE HOUSING TRUST, LTD.—Electrical work in connection with erection of 18 houses at Factor's Park, Gorgie. Schedules, until March 15th, from Mr. A. H. Mottram, 59, Frederick Street, Edinburgh.

LEEDS CORPORATION.—Heating installation for dining room and certain bedrooms at Gateforth sanatorium, electrical re-wiring of building, and replacement of engine for driving electrical generating plant.

Irish School Lighting.

BELFAST EDUCATION COMMITTEE, March 15th.—Electric light installation in Riga Street and Montcollyer Elementary Schools. Specifications, etc., from the Education Architect, Victoria Street, Belfast; deposit £1 1s. for each.

BIRMINGHAM GUARDIANS, March 15th.—Two electric refrigerators, for Selly Oak Hospital. Particulars from the Clerk, Union Offices, Edmund Street, Birmingham.

EDINBURGH CORPORATION, March 15th.—One 1 500 kW motor-converter, for Dewar Place sub-station. Specification from Mr. E. Seddon, engineer and manager, Electricity Department; deposit 10s. 6d.

NORTHERN IRELAND MINISTRY OF FINANCE, March 15th.—Electric light and power installation at Malone Training School, Belfast. Form of tender, etc., from the Secretary to the Ministry, 15, Donegall Square West, Belfast.

BELFAST MENTAL HOSPITAL, March 18th.—Twelve months' supply of electrical fittings. Forms of tender from Mr. J. Harper, secretary, at the Asylum, Purdysburn, Belfast.

BRADFIELD RURAL DISTRICT COUNCIL, March 18th.—Electric motors (with switchgear) for driving air compressors, at Pangbourne sewage works. Specification from the engineer, Mr. C. H. Stafford, 209, King's Road, Reading; or the Clerk, Town Hall Chambers, Reading.

DUDLEY HILL WESLEYAN CHAPEL, BRADFORD, March 18th.—Electric wiring and fitting of classrooms. Premises may be inspected on application to the Caretaker, 11, Dudley Street, Bradford.

EDINBURGH CORPORATION, March 18th.—Supply of e.h.t. sub-station switchgear. Specification (No. 99) from Mr. E. Seddon, engineer and manager, Electricity Department, Dewar Place, Edinburgh; deposit 10s. 6d.

EDMONTON GUARDIANS, March 18th.—Six months' supply of electric lamps, and X-ray, light, massage, etc., requisites. Forms of tender from the Clerk, 77, Bridport Road, Edmonton, London, N.18. Stamped, addressed envelope to be sent.

LANCASTER CORPORATION, March 18th.—Two water-tube boilers, to evaporate 36 000 lb. of water per hour, with mechanical stokers, etc., at Caton Road generating station. Specification, etc., from the Borough Electrical Engineer; deposit £2.

RAINFORD URBAN DISTRICT COUNCIL, March 18th.—Wiring of village hall and Council offices. Specification, etc., from the Clerk or Surveyor, Council Offices, Church Street, Rainford.

MANCHESTER CORPORATION, March 18th.—Twelve months' supply of incandescent lamps. Forms of tender, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

NEWTON ABBOT URBAN DISTRICT COUNCIL, March 18th.—Supply of pumping and other equipment, with electric motors, control panels, etc., for sewer construction works. Specifications from Mr. F. W. S. Stanton, 5, Victoria Street, London, S.W.1.

CARDIFF CORPORATION, March 19th.—Supply of e.h.t. and l.t., paper insulated cables during 12 months, commencing April 1st (specification No. N 64), and supply and erection of natural draught cooling tower (specification N 65). Specifications, etc., from the City Electrical Engineer, The Hayes, Cardiff. Only members of the King's National Roll are invited to tender.

PONTYPRIDD GUARDIANS, March 19th.—Six months' supply of electrical materials. Forms of tender from the Clerk, Union Offices, Pontypridd.

ROTHERHAM GUARDIANS, March 19th.—Supply of electrical sundries. Forms of tender from the Clerk to the Guardians, 26, Moorgate Street, Rotherham.

EARBY URBAN DISTRICT COUNCIL, March 20th.—Electricity distribution scheme. Specification, etc., from Mr. B. Hindle, clerk to the Council, Earby, near Colne; deposit £1 1s.

HOLBORN (LONDON) GUARDIANS, March 20th.—Supply of electrical fittings, for six months. Forms of tender from the Clerk, 53, Clerkenwell Road, E.C.1. Stamped, addressed envelope to be sent.

METROPOLITAN ASYLUMS BOARD, March 20th.—Automatic telephone system at North Western Fever Hospital, Hampstead, N.W.3. Specification, etc., from the Board's Office, Victoria Embankment, E.C.4; deposit £1.

PADDINGTON (LONDON) GUARDIANS, March 20th.—Six months' supply of electricians' sundries, etc. Forms of tender from the Clerk, 313-319, Harrow Road, W.9. Stamped, addressed envelope to be sent.

CHORLEY RURAL DISTRICT COUNCIL, March 21st.—Two electrically-driven pumps, switch and control gears, etc. Specifications from Mr. W. Cotterill, surveyor, High Street, Chorley; deposit £2 2s.

DEVON MENTAL HOSPITAL, EXMINSTER, March 21st.—Supply, for six months, of electric lamps, etc. Further particulars from the clerk, Mr. Cecil Masters.

HULL CORPORATION, March 21st.—Supply of three 1 500 kW motor-converters. Specification, etc., from Mr. J. N. Waite, Electricity Works, Sculcoates Lane, Hull; deposit £1 1s.

HULL CORPORATION, March 21st.—One 2 000 000 gal. per hour, electrically driven circulating water pump, motor, motor starter, etc. Specification from Mr. J. N. Waite, Electricity Works, Sculcoates Lane, Hull; deposit £1 1s.

NELSON EDUCATION COMMITTEE, March 21st.—Electric light installation in Bradley, Walverden and Somerhaye Council Schools. Specification, etc., from Mr. J. Skinner, Education Offices, Market Street, Nelson.

STOURBRIDGE GUARDIANS, March 21st.—Supplies of electric lamps for six months. Particulars from the clerk, Mr. G. F. James, 12, Hagley Road, Stourbridge.

WEST SUSSEX COUNTY MENTAL HOSPITAL, March 22nd.—Twelve months' supply of electric lighting sundries. Forms of tender, etc., from the Clerk and Steward, at the Hospital, Graylingwell, Chichester.

HARROGATE CORPORATION, March 23rd.—Twelve months' supply of cables, joint boxes, joint box compound, service meters, service cut-outs, and transformers. Specifications, etc., from Mr. N. McLean, borough electrical engineer, 33, Swan Road, Harrogate.

HARROGATE CORPORATION, March 23rd.—One year's supply of meter boards, etc. Forms of tender from the Borough Electrical Engineer.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, March 25th.—Electric lighting installation in seven blocks of tenement buildings. Specification, etc., from Mr. David J. Keep, town clerk, Town Hall, Cambridge Road, E.2; deposit £2 2s.

Annual Supplies of Electrical Stores.

EDINBURGH CORPORATION, March 25th.—Supply of materials to the electricity department for 12 months, including cables, conduits, fuses and fuse boards, electrical material, electricity meters, meter boards, etc. Specification from the Engineer and Manager, Dewar Place, Edinburgh.

FARNWORTH URBAN DISTRICT COUNCIL March 25th.—Supply of l.t. cables. Specifications, etc., from Mr. A. J. Hutchinson, Electricity Dept., Albert Road, Farnworth, Lancs.

GLOUCESTER CORPORATION, March 25th.—Supply and erection of two 1 000 kW motor generators, for conversion of 11 000 V 50 cycle a.c. to 460/500 V d.c. Specification, etc., from the City Electrical Engineer, Commercial Road, Gloucester.

ILFORD CORPORATION, March 25th.—Supply of paper insulated cables. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Ley Street, Ilford.

Digitized by Google

KNOTTINGLEY URBAN DISTRICT COUNCIL, March 25th.—Electric light wiring of 48 proposed houses in Weeland Road and Womersley Road, Knottingley. Specifications, etc., from the Surveyor, Town Hall, Knottingley.

BETHNAL GREEN (LONDON) GUARDIANS, March 26th.—Installation of electric fans in parts of Institution, Waterloo Road, E.2, and of Hospital, Cambridge Road, E.2. Specification, etc., from the Clerk, Administrative Offices, Bishop's Road, Bethnal Green, E.2; deposit £1.

BLACKPOOL CORPORATION, March 27th.—Two electrically-driven sewage pumps. Specification, etc., from the Borough Engineer.

BROOK MOTORS, LTD., March 29th.—Electric lighting work in connection with extensions to Empress Works, St. Thomas's Road, Huddersfield. Plans, etc., can be seen at the offices of Mr. J. Arnley, 55, New Street, Huddersfield.

RHONDDA URBAN DISTRICT COUNCIL, March 30th.—Supply of house service, a.c., ordinary and prepayment meters, cable joint boxes, compound, cut-outs, etc., for one year. Specifications, etc., from the Electrical Engineer, Electricity Works, Porth, Glam.

MANCHESTER CORPORATION, April 3rd.—Supply and placing in position at Oldham Road "B" sub-station of one 8 000 kVA forced air-cooled transformer, 32 000/6 600 V, three-phase, 50-period. Specification (No. 232) and form of tender from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

CENTRAL ELECTRICITY BOARD, April 15th.—Supply and erection of 33 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-S.L.2) from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, April 29th.—Supply and erection of electricity meters, in connection with the Central Scotland Electricity Scheme. Specification (No. CS-SS 14) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BENGAL NAGPUR RAILWAY CO., LTD., March 15th.—Supply of five-ton overhead electric travelling crane. Specification, etc. (10s.), from the company's Offices, 132, Gresham House, Old Broad Street, London, E.C.2.

CAPE TOWN MUNICIPALITY, March 15th.—Supply of metal-clad switchgear (specification 449/28). (Reference B.X. 5 004.)

CHILEAN MINISTRY OF MARINE, March 15th (extension of date)—Two electric travelling cranes, for Port of Valdivia. (Reference A.X. 7 353.)

VICTORIAN RAILWAY COMMISSION, March 15th.—Supply of armoured telephone cable (contract 4 2501). (Reference B.X. 5 126.)

VICTORIA ELECTRICITY COMMISSION, March 18th.—Supply of 1 300 strings of suspension insulators, 600 strings of tensioning insulators, 1 300 conductor suspension clamps, 350 conductor tensioning clamps, 50 semi-anchor clamps for "V" strings of insulators, 200 semi-anchor clamps for single strings of insulators, 475 earth wire suspension clamps and 125 earth wire tensioning clamps. (Reference B.X. 4 997.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, March 19th.—Supply of three-phase, Diesel-driven 50 kVA generating set, and electrically-driven water pumping set. (Reference B.X. 5 050.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 110 000 V transformer, for Mangahao electric power scheme (section 204). (Reference B.X. 4 952.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 11 000 V switchgear, for Mangahao power development (section 203). (Reference B.X. 4 953.)

DUNEDIN, N.Z., CORPORATION, March 20th.—Supply of hand brake equipment, electrical equipment for magnetic brakes and bogie trucks, for tramcars.

CAPE TOWN MUNICIPALITY, March 21st.—Supply of 300 A fuses (specification 453/1928). (Reference B.X. 5 080.)

JOHANNESBURG MUNICIPALITY, March 21st.—Supply of 65 500 porcelain insulators (contract No. 135). (Reference B.X. 5 114.)

ANTWERP MUNICIPALITY, March 22nd.—Supply of electric cable and accessories. (Reference B.X. 5 124.)

SOCIETE NATIONALE DES CHEMINS DE FER VICINAUX, BRUSSELS, March 27th.—Supply of tramcars and trailers. (Reference A.X. 7 639.)

PORT ELIZABETH MUNICIPALITY, March 28th.—Supply of 33 000 V cable (specification No. 18). (Reference B.X. 5 147.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 17th.—Supply of copper earthplates (specification 133). (Reference A.X. 7 556.)

UMTALI (SOUTHERN RHODESIA) MUNICIPALITY, April 18th.—Supply of 1 000 kW turbo-alternators, spray cooling plant, switchgear and crane (contract B). (Reference B.X. 5 145.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills, with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

ADMIRALTY.—Edison Swan Electric Co., Ltd., switches.

GRAVESEND CORPORATION.—Freed Bros., electric lighting at sanatorium, £65.

BRIGHTON CORPORATION.—Ferranti, Ltd., supply of two 200 kVA transformers, £277.

NEWMILNS CORPORATION.—John Morton and Son, wiring houses for electric light, £18.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., telephone switchboard lamps.

READING GUARDIANS.—Erlco, Ltd., electric light installation at Battle Infirmary, £723.

BLACKBURN CORPORATION.—T. Blackshaw, electric lighting installation at Roe Lee School.

DEAL CORPORATION.—Crossley Bros., magneto-ignition for engines at drainage pumping station.

BROMLEY (KENT) CORPORATION.—A. Sutton, wiring 91 houses for electric light, £531 11s. 6d.

PARISH CHURCH AND MEMORIAL HALL, BRENCHLEY.—H. Featherstone, electric light installation.

INDIAN STORES DEPARTMENT.—Greaves Cotton and Co., Ltd., Crompton d.c. ceiling fans, Rs. 1 566.

DEWSBURY EDUCATION COMMITTEE.—W. Angus, electric light installation at open air school, £62 8s.

RAMSGATE CORPORATION.—A. E. Pinto, rewiring electric lighting system at Royal Victoria Pavilion, £137.

PLYMOUTH CORPORATION.—W. G. Heath and Co., electric light installation at the smallpox hospital, £257 10s.

ISLINGTON (LONDON) BOROUGH COUNCIL.—Nelson Electric Co., Ltd., twelve months' supply of electric lamps.

HAMPTON URBAN DISTRICT COUNCIL.—Radio, Ltd., installation of wireless set at Isolation Hospital, £59 10s.

WARRINGTON CORPORATION.—Fuller Electrical and Manufacturing Co., Ltd., supply of 600 kVA transformer.

LEEDS GUARDIANS.—A. Innes, re-installation of electric light wiring in children's block at Rothwell Institution.

WEST HAM EDUCATION COMMITTEE.—Harland and Wolff, electric light installation at South Hallsville school, £545.

GUILDFORD CORPORATION.—Ferguson, Pailin, Ltd., 25 kVA kiosk, £100; W. Lucy and Co., Ltd., 10 kVA kiosk, £35 5s.

SOUTHEND EDUCATION COMMITTEE.—Jackson and Co., electric light installation at the intermediate schools, £497 18s. 2d.

ST. STEPHENS SCHOOL, PADDINGTON (LONDON).—Haine and Co., improvement of electric lighting, £277. (Recommended.)

LEYTON CORPORATION.—Power Lines Construction Co. Ltd., change-over from d.c. to a.c. in the Cann Hall area, £25 000.

BRIGHTON CORPORATION.—Yarrow and Co., Ltd., supply of two boilers, each of 75 000 lb. evaporation, £46 130. (Recommended).

BATTERSEA (LONDON) BOROUGH COUNCIL.—Watson and Sons (Electro-medical) Ltd., lamps and apparatus, for solarium at Southlands, £187 4s.

Digitized by Google

BINGLEY URBAN DISTRICT COUNCIL.—L. S. Dyer, electrician's work in 20 houses, and R. White, electrician's work in 28 houses, at Cottingley.

BIRMINGHAM CORPORATION.—Herbert Morris, Ltd., erection of overhead cranes at Chester Street and Water Street sub-stations. (Recommended.)

LONDON COUNTY COUNCIL.—H. J. Cash and Co., for electric lighting at Webber Street school, £185 (approximate). (Recommended.)

HOLBORN (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., 12 months' requirements of Osram gasfilled and vacuum lamps.

WESTMINSTER CITY COUNCIL.—Coleby and Co., re-wiring and supplying gearing lanterns, at Buckingham Palace Road baths, £105. (Recommended.)

Switchgear and Cables.

ROTHERHAM CORPORATION.—A. Reyrolle and Co., Ltd., two truck type switches, £256; Callender's Cable and Contruction Co., Ltd., supply of cable, £1 659 6s.

LONDON MIDLAND AND SCOTTISH RAILWAY.—General Electric Co., Ltd., 12 months' requirements of Osram gasfilled, vacuum, and train lighting lamps, etc.

BURTON-ON-TRENT CORPORATION. — Metropolitan-Vickers Electrical Co., Ltd., supply of two 250 kVA transformers, £295; Donovan and Co., supply of switchboard, £147.

LONDON AND NORTH-EASTERN RAILWAY CO.—British Thomson-Houston Co., Ltd., supply and erection of additional 500 kW turbo-generator at Parkeston power station.

LIVERPOOL CORPORATION.—Forest City Electric Co., Ltd., provision of automatic traffic control signals, to be erected at the junction of Lord Street and Church Street, £65.

EAST HAM CORPORATION.—Enfield Cable Works, Ltd., 0·75 cable, £1 280 per 1 000 yards; 0·5 cable, £920 per £1 000 yards, and 0·3 cable, £540 per 1 000 yards. (Recommended.)

BARNES URBAN DISTRICT COUNCIL.—Reliance Telephone Co., Ltd., installation and maintenance of departmental telephones, at Council House, 10s. per instrument per quarter.

STRETFORD URBAN DISTRICT COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., supply of 33 000 V switchgear, £28 600; supply of transformers, £23 050; and supply of 6 600 V switchgear, at Trafford power station, £17 627.

YORK CORPORATION.—Municipal Electricity Department, installation of cables to police boxes, £158; supply of lighters and heaters, £54; and current, £7 per annum; and electric light installation at Clifford Street Technical Institute, £490 5s.

WANDSWORTH (LONDON) GUARDIANS).—Ashworth and Parker, electric generating plant and motors, £2 604; Anderson, Angell and Co., wiring for electric lighting and power, £1 815, in connection with engineering reconstruction at Swaffield Road Institution.

GLASGOW CORPORATION.—R. J. McIntyre, electrical installation in 318 houses under Haghill rehousing scheme, £1 240, and electrical installation in 174 houses in Saracen Street area No. 1, including lamps, £715; Kennedy, Stark and Co., electric lighting, bell and fire alarm installations at Mearnskirk Sanatorium, £1 571.

BATTERSEA (LONDON) BOROUGH COUNCIL.—British Electric Transformer Co., Ltd., two 500 kVA transformers (£467), and Bertram Thomas, e.h.t. and l.t.-switchgear (£1 167), in connection with supply to Hovis, Ltd. Watson and Sons (Electro-Medical), Ltd., supply of electric lamps and apparatus to Solarium, Southlands, £187.

LEEDS CORPORATION.—W. T. Henley's Telegraph Works Co., Ltd. (£2 565); Enfield Cable Works, Ltd. (£1 808); Hackbridge Cable Co., Ltd., (£1 194); and Greenwich Cable Works, Ltd. (£1 058 15s. 6d.), supply of cables; Metropolitan-Vickers Electrical Co., Ltd., supply of automatic control gear, for electric pump at waterworks, £64.

MANCHESTER CORPORATION.—J. Blakeborough and Sons, supply of electrical operating gear at Lostock booster station; R. H. Clampnett and Co., and Hall and Stinton, Ltd., electrical installations at houses on Barlow Moor estate; C. A. Parsons and Co., Ltd., and English Electric Co., Ltd., supply of static transformers; Metropolitan-Vickers Electrical Co., Ltd., oil purifier for Stuart Street sub-station; Tudor Accumulator Co., Ltd., repairs to battery at Dickinson Street station.

CARLISLE CORPORATION.—A. G. Bullen and Co., electric light installation for 14 houses on Newtown-Raffles estate, 40 on Longsowerby estate, and 22 on Botcherby estate; W. Batey and Sons, electric light installation for 119 houses on Newtown-Raffles Estate, 12 on Longsowerby estate, and 92 on Botcherby estate; British Thomson-Houston Co., Ltd,. supply and erection of 15 000 kW turbo-alternator, £34 874; Mirrlees-Watson Co., Ltd., surface condenser, at Willow Holme generating station, £10 052.

CENTRAL ELECTRICITY BOARD.—British Insulated Cables, Ltd., Callender's Cable and Construction Co., Ltd. and Pirelli-General Cable Works, Ltd., 66 kV and other cables, British Thomson-Houston Co., Ltd., 66 kV switchgear in London area, under South-East England Scheme; Balfour Beatty and Co., Ltd., 132 kV overhead transmission lines, and General Electric Co., Ltd., 132 kV outdoor switchgear, under Central England Scheme; Foundation Co., Ltd., 132 kV overhead transmission lines, under North-West England and North Wales Scheme. Total, approximately, £3 250 000, making with contracts previously placed, £6 250 000. (See page 327.)

LONDON COUNTY COUNCIL.—Edison Swan Electric Co., Ltd., supply of control battery required in connection with new swichgear for Greenwich power station, £452 1s. 9d. Other tenderers:—Alton Battery Co., Ltd., £562 6s. 8d.; Tungstone Accumulator Co., Ltd., £627 19s.; Fuller Accumulator Co. (1926), Ltd., £647 5s.; D. P. Battery Co., Ltd., £672 0s. 6d.; Pritchett and Gold and E.P.S. Co., Ltd., £672 4s.; Chloride Electrical Storage Co., Ltd., £679 1s. 4d.; Premier Accumulator Co. (1921), Ltd., £679 2s. 6d.; Hart Accumulator Co. (1926), Ltd., £683 10s. 7d.; British Thomson-Houston Co., Ltd., £690 10s.; Tudor Accumulator Co., Ltd., £695 5s. 6d.; Siemens Brothers and Co., Ltd., £745 10s. 7d.

LONDON COUNTY COUNCIL.—General Electric Co., Ltd., supply of reactors (£802), and Standard Telephone and Cables, Ltd., supply of cables (£1 234 0s. 9d.); required in connection with new switchgear for Greenwich power station. These were the lowest quotations for reactors and cables, respectively, but the tenders, as originally submitted, included both, the list of tenderers being as follows:—General Electric Co., Ltd., Kingsway, W.C.2, £2 075 3s. 8d.; Standard Telephone and Cables, Ltd., £2 242 0s. 9d.; British Thomson-Houston Co., Ltd., £2 277 10s. 10d. (provisional sum for night work deducted); Callender's Cable and Construction Co., Ltd., £2 339 10s. 10d.; Siemens Brothers and Co., Ltd., £2 342 7s. 4d. W. T. Glover and Co., Ltd., £2 342 17s. 9d.; Macintosh Cable Co., Ltd., £2 371 10s. 6d.; Johnson and Phillips, Ltd., £2 405 7s. 4d.; British Insulated Cables, Ltd., £2 398 14s. 6d. (incomplete); W. T. Henley's Telegraph Works Co., Ltd., £1 383 8s 10d. (one item not quoted for).

BIRMINGHAM CORPORATION.—Thomas Glover, electric light installation, and Callenders' Cable and Construction Co., Ltd., overhead and underground cables at Coleshall mental institution; British Vacuum Cleaner and Engineering Co., Ltd., vacuum dust extracting plant, for Summer Lane power station; Thomas Piggott and Co., Ltd., works in connection with installation of grit collectors at Nechells power station; Hackbridge Electric Construction Co., Ltd., supply of transformers, at Water Street, Chester Street, Freeth Street and Sparbrook sub-stations; Harland Engineering Co., Ltd., supply of rotary converter, at Belchers Lane sub-station; Electricars, Ltd., three electric vehicles, and General Vehicle Co., Ltd., one electric vehicle, for the cleansing department; Ray Electrical Co., electric light installation at King's Norton secondary school; R. H. Newton, electric light installation at Birches Green school; Baxter and Impey, electric light installation at Colmore Road school; Reynolds and Bradwell, electric generating plant and installation at Boys' Camp School Clent, and electric light installation at Dolphin Lane school.

Reconstruction Work.

WANDSWORTH (LONDON) GUARDIANS.—Engineering reconstruction at Swaffield Road Institution: Ashworth and Parker, electric generating plant and motors, £2 604. Also tendered for plant including compound type engine, £3 656. Other tenders: W. H. Allen, Sons and Co., £3 325; Wallace and Sons, £3 211; Harland Engineering Co., £3 086; Newtons of Taunton, £2 964; Robey and Co., Ltd., £2 955; Tate and Co., £2 780, alternative for Hindley's engine, £2 680; H. A. Neale and Co., £2 667; T. Clarke and Co., Ltd., £2 624, ditto, for different speed of engine, £2 784; Electric Installations, Ltd., £2 544; alternative for Hindley's engine, £2 719; alternative for Allen's engine coupled to Crompton-Parkinson dynamo, £2 849, and alternative for Allen's engine and dynamo, £2 944; Anderson, Angell and Co., £2 420, alternative for Allen's engine, £2 791. Anderson, Angell and Co., electric light and power wiring, £1 815. Also tendered: L. G. Tate and Co., £2 851; Burdette and Co., Ltd., £2 774; J. Briggs (Electric Contractors), Ltd., £2 767; R. A. Brooks and Sons, £2 690; H. A. Neale and Co., £2 626; Alpha Manufacturing and Electric Co., £2 522; T. Clarke and Co., Ltd., £2 314; Wallace and Sons, £2 105; Electric Installations Ltd., £1 982.

TELEVISION EXHIBITION.

Brief Review of Some of the Exhibits of Historical Apparatus.

PROMINENT among the exhibits at the first annual exhibition of the Television Society, which was held at the Engineers' Club, Coventry Street, London, on March 5th, were a number of historical devices, used by Mr. Ll. B. Atkinson in television experiments 47 years ago.

The exhibits included an analysing device (Fig. 1) consisting of a series of mirrors on a wheel, which reflected the image to be transmitted on to a point cell. Each mirror carried one line of the picture across the point, whilst the successive mirrors were inclined parallel to the axis of rotation, so that each mirror projected successive lines. The receiver consisted of a similar series of mirrors which, revolving synchronously with the transmitter, built up from a light point the image transmitted. The apparatus presenting this idea is shown in Fig. 2. In order to avoid all electrical reproduction, Mr. Atkinson projected an image by a revolving mirror on to a point representing the selenium cell, and this same point by means of a mirror behind it gave back a similar impression, which was reflected on to another mirror on the same axis as the first; the resulting light point therefore, going through the required changes and being oscillated, gave in a dark room a reproduction of the original image. Though at the time of these early experiments no very exact information existed as to the speed at which the light charged a selenium cell, it was known that light from an interrupted source falling on such a cell would produce a musical note in a telephone, and so it was assumed that at least telephonic frequency could be reached. In the receiving apparatus shown by Mr. Atkinson two applications of this knowledge were demonstrated. The first included a horse-shoe magnet with a thin ferro-type armature (Fig. 3), operating a small mirror fixed to a fairly rigid wire, so as to have a very rapid period of oscillation. This mirror received an image or beam of light, and reflected this through a small hole in a plate. When the image passed through the plate it was reflected by the moving mirror on to the viewing screen. If the movement of the mirror took the light spot off the hole, a dark spot resulted on the screen. Fig. 5 was fitted up to show the movement of the light spot and was an adaptation of the revolving chalk cylinder of Edison's loud-speaking telephone of about 1878. The chalk cylinder wetted with mercury sulphate had a spring pressing on it. The friction varied by the varying current received from the selenium cell, and the spring operated a small mirror.

Fig. 4 was described as a telephone with an enclosed space in front of the diaphragm. Through this chamber coal gas was passed, and the movements of the diaphragm caused a small sensitive flame to rise and fall behind a slit, thus giving light and dark. A further early device (Fig. 6) was a telephone, to the diaphragm of which was attached a slightly convex mirror; fixed to a front plate was a flat glass. Between these appeared interference rings known as Newton's rings. A movement of 1/100 000 of an inch, working with monochromatic light would, it was explained, give a change of the central spot, from yellow, say, to black.

Other exhibitors were Dr. C. Tierney, who demonstrated molecular bombardment; Mr. R. R. Poole, who showed a polarised light-modulator and mirror assembling device, and a static amplifier. Mr. H. S. Ryland gave a demonstration and talk on selenium cells and the optical methods of making the most of the available light, while Capt. R. Wilson showed a complete shadow transmitter and receiver. Mr. Colin P. Garside exhibited a portable receiver for pictures of about 9 sq. in. Mr. Wilfred H. Troutbeck showed a cathode-ray oscillograph, loaned by Standard Telephones and Cables, Ltd. Mr. J. J. Denton, the General Electric Co., Ltd., Philips Lamps, Ltd., and W. Edwards and Co. also exhibited.

EX-BRITISH WESTINGHOUSE MEN.

Big Attendance at Eleventh Annual Reunion.

ONCE again ex-B.W. men have met in merry mood, and once more they are looking forward to the next dinner. Mr. F. Massingberd Rogers presided at the Hotel Cecil, on March 8th, over another record attendance, nearly 140 "old timers" turning up from all parts of the country. As it is a family affair the Press is not invited, but we understand that the proceedings were, as usual, delightfully informal.

The chairman was inducted by the hon. treasurer who preceded him to his place with the now famous "half crown" on the end of a long wand; this emblem of the Association was at once illuminated when placed in position behind the chair. Mr. B. P. Boyle gave the toast of the Association, to which the chairman responded in a reminiscent vein, which was greatly to the liking of the company. He emphasised that early pioneer years formed friendships which influenced their careers in later life. He felt that the late George Westinghouse would have liked to see that assembly.

Among the prizes in the 1s. ballot was a genuine Yarmouth bloater, which went to A. F. Bock, who auctioned it for the Association funds. The "Silent Toast" had a touch of sadness this year, the loss to the Association being no fewer than six members who have died since the last reunion—A. P. Ambler, J. A. Henderson, W. A. Hetherington, "Charlie" Parkes and A. Simon. Letters of regret were received from all parts of the world from members unable to attend; the toast "Absent Friends" was submitted with acclamation at 10 o'clock. The entertainment side was ably carried through by J. Gibson Young, himself a member of the Association, with Jacqueline and Imito. Among the usual informal toasts this year that of the "Grandfathers" provoked great merriment, the respondents being Messrs. Dyer, Seaman, Warrilow and Sergt. McCully. The programme would not accommodate the chairman's extreme length so the cartoonist (Mr. E. Sanson) had to wrap him round the covers! See page 333.

THE historical exhibits shown by Mr. Ll. B. Atkinson at the Television Exhibition referred to above. The two right-hand pictures are Figs. 1 and 2, reading left to right, while below in the same order are Figs. 3 to 6.

ELECTRICITY SUPPLY.

Loans for Mains at Sheffield and Manchester—Rural Supply in Daventry District—Extension of Aberdeen Supply—Revision of Beckenham Tariffs—Brighton's Proposal to Make Wiring Regulations.

SHEFFIELD Electricity Committee has obtained sanction to borrow £49 897 for feeder mains.

Barnstaple T.C. has decided to instal a further 300 kW Diesel generating set during 1930.

The Ascot District Gas and Electricity Co. is to erect overhead electric lines in the Chobham district.

Sanction for a loan of £50 000 for feeder mains has been obtained by Manchester Electricity Committee.

The 100 kW transformer at Shipley Fields Road, Shipley, is to be replaced by a 250 kW transformer, at a cost of about £200.

Electricity sold by the Calcutta Electric Supply Corporation, Ltd., during 1928, was 147 875 086 kWh, increase 18 784 859 kWh.

Walsall Electricity Committee has authorised a programme of extensions involving a cost of £17 000 for mains and sub-stations.

Brighton Corporation Lighting Committee is to extend mains to the Whitehawk housing estate, at an estimated cost of £2 350.

Fulham (London) Electricity Committee has voted £816 for equipment for a sub-station in the vicinity of Bishop's Mansions.

Birkenhead Electricity Committee recommends the purchase of the undertaking of the Gayton Park Electricity Co., Ltd., for £500.

Bolton Electricity Committee is arranging for the erection of overhead lines in connection with the supply to the Over Hulton district.

The Leicestershire and Warwickshire Power Co. have completed the extension of the mains to Heather, which is now lighted by electricity.

Fulham (London) Electricity and Lighting Committee proposes to lay new cables in several thoroughfares, at an estimated cost of £1 430.

The Twickenham and Teddington Electric Supply Co., Ltd., has informed Esher U.D.C. of its intention to lay a cable in Manor Road, Thames Ditton.

Highbridge U.D.C. has approved plan submitted by the North Somerset Electric Supply Co., Ltd., of an extension of the 11 000 V mains in the Council's area.

Wigan T.C. has applied for a loan of £30 000 for transformers, switchgear, mains, etc., for a supply of electricity to Upholland, Standish, Shevington and Wrightington.

Herne Bay U.D.C. has granted permission to the Herne Bay and District Electricity Co. to extend the mains from Margate Road to the Burton Downs Estate.

Newbury Corporation has arranged provisional terms with the Wessex Electricity Co., Ltd., for the supply of electricity for power purposes at the Cold Ash pumping station.

Croydon Corporation is extending the 0·15 triple distributor at the bottom of Aberdeen Road through Aberdeen Road to St. Peter's Road, at an estimated cost of £330.

Reigate R.D.C. has consented to an application by the Dorking Electricity Supply Co., Ltd., for a Special Order to supply electricity to the parishes of Betchworth and Buckland.

Daventry R.D.C. has decided to consent to the Northampton Electric Light and Power Co., Ltd., erecting an overhead line from Daventry to Woodford, with overhead distributing mains in the villages in the district.

Wakefield Electricity Committee has authorised the Electrical Engineer to purchase an additional 750 kVA group of Scott-connected transformers, with a standardised spare limb, at a cost of approximately £650.

Finchley Committee recommends that where a single service already exists for affording a supply to any premises, an extra service should be laid without charge to the consumer for a distance up to 60 ft. from a distributing main.

Bedwas and Machen U.D.C. has received sanction to a loan of £8 575 for the extension of the electricity undertaking, which will enable the Council to proceed with extensions to cover Bedwas, Trethomas, and Maesycwmmer.

Heston and Isleworth U.D.C. proposes to effect street lighting improvements in High Street, and London Road, Hounslow, by the provision of 1 000 c.p. lamps, spaced at a distance of 140 yards, at an estimated cost of £4 612.

The Government Secretary having asked if Douglas (Isle of Man) Corporation is prepared to provide electric light in the Customs House, the Town Clerk has been instructed to forward particulars of the terms on which the supply can be given.

It was reported recently to Darlington T.C. that only three towns in the country produced electricity more cheaply than Darlington, where the cost, on an output of 20 000 000 kWh, was 0·42d. This year it was hoped to reduce it to 0·39d.

A report of the Eastbourne Electricity Committee states that, so far as can be ascertained at present, the profit on the past year's working of the electricity department will probably be a little over £12 000.—Sanction is being sought to a loan of £15 408, for mains extensions, etc.

Aberdeen Electricity Committee has agreed to supply the area on the north side of the Bridge of Don with electricity. There are prospects of considerable expansion in this direction, including a potential demand for supply to the new barracks which are to be erected at a cost of £140 000.

Stoke-on-Trent Electricity Committee has decided that an extension of l.t. a.c. distributing main be laid from High Street West to Direct Timber Supplies, Ltd., and along High Street West, Fenton, and that a circuit breaker be purchased for a sub-station in High Street West, Fenton, at a total cost of £1 200.

The new hydro-electric supply in Ross-shire has been handed over by the contractor, and is now in regular use. The line is being extended to Tain, and farms along the route are being offered special terms for supplies. The service is giving great satisfaction, and the use of electricity for power and heating is being encouraged by the Ross-shire Electrical Supply Co.

St. Pancras (London) Electricity Committee has arranged to provide an auxiliary supply to Maple and Co., Ltd., Tottenham Court Road. At present this firm undertakes its own generation, and now requires an auxiliary supply of about 75 kW, increasing to 100 kW.—The Committee has received sanction to borrow £24 159 for mains, meters, wiring and domestic apparatus.

In consequence of the re-valuation of the district, Beckenham Electricity Committee has revised the percentages of rateable value applicable to the "all in" tariffs as follows: 8% on the first £75 of rateable value instead of 10%; 3% on rateable value above £75, instead of 4%. The price of current to "all in" consumers is also reduced. Consumers not using an electric cooker will pay in the two summer quarters 1d. per kWh instead of 1½d., and consumers using an electric cooker ¾d. instead of 1d.

Dealing with the subject of the regulation of electric wires and fittings, the Town Clerk of Brighton reports that the general law, as it stands to-day, would not enable the Corporation to prescribe standard rules in regard to wires and fittings on consumers' premises. Section 59 of the Brighton Corporation Act, 1900, gives the Corporation power to make bye-laws with respect to any wires, apparatus and fittings in any building or premises within the borough supplied with electricity, but no bye-laws have been made under this section. This section goes part of the way, but it does not, in terms, empower the Corporation to make bye-laws with respect to the nature, material, workmanship and mode of arrangement of wires, apparatus and fittings. The Electricity Committee has instructed the Town Clerk to include such powers as may be necessary in the next Bill which the Corporation promotes.

St. Pancras (London) Electricity Committee is to extend the feeder mains from Highgate sub-station to Fortess Road and Lady Somerset Road, £3 270; from Grafton Road sub-station to Great College Street, £980; and from Tavistock Place sub-station to Gray's Inn Road and King's Cross Road, £2 050.—The Grand Union Canal Co. has called attention to the amount of vapour rising from the surface of the canal, resulting from the discharge of warm water from the Council's condensing plant into the canal. The company's engineer suggests that the water should be discharged below the water level of the canal, and provision is to be made to effect this.—The London and North-Eastern Railway Co. has an agreement with St. Pancras for a bulk supply to King's Cross station, and proposes to arrange for an emergency supply of about 25 kW from Islington. St. Pancras Electricity Committee has no objection to offer.

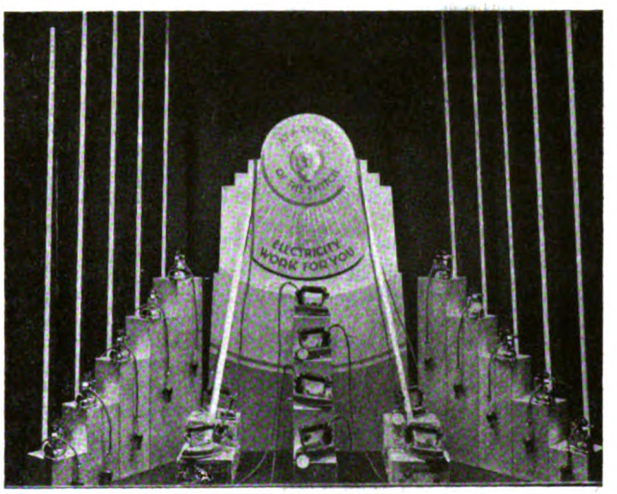
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Sir John Brooke, who has resigned from the position of secretary to the Central Electricity Board in order to become an Electricity Commissioner. See page 326.

The first of the high-power regional broadcasting stations to be used in this country is here seen taking shape. It is situated near Potter's Bar (London) and it is hoped that the first transmission tests will be made during May next.

Sir John Denison-Pender, chairman of the Eastern Telegraph Co., Ltd., and associated companies, whose death on Wednesday, March 6th, is referred to on page 326.



The March Selling Campaign of the E.D.A. is now well under way, and considerable business is reported to be following in its wake. More than average interest has been shown by electrical contractors in the window displays illustrated above, and a number of these are to be seen up and down the country. The simplicity of the windows, together with the campaign concentrating on one particular type of domestic appliance are features which are making their mark on showroom sales in every town.

Members of the Ex-British Westinghouse Association at the eleventh annual re-union, on March 8th, at the Hotel Cecil, London. The chair was taken by Mr. F. Massingberd Rogers, and the attendance was about 140. See page 331.

COMPANY NEWS.

Radio and Gramophone Merger—British Insulated Share Bonus—Transfer of Aluminium Corporation's Hydro-Electric Station—G.E.C. British Shares—Progress of North Metropolitan Co.—Metropolitan Co.'s Two-Part Tariff.

A FURTHER relapse of half-a-crown has brought the price of General Electric shares down to 55s., and other electrical share quotations also exhibit weakness, with the exception of Callender's Cable shares, which are 1s. 3d. up on the week. Underground Electric Railways ordinary at 23s. 6d. are 1s. 6d. down, Brush and Siemens each 1s. 3d., and Ever Ready ordinary and Crompton-Parkinson 6% preference 6d. Marconi's Wireless are a shade stronger, but Eastern Telegraph stock has given way a few points. Amongst electricity supply shares, County of London ordinary have dropped 3s. and Newcastle-upon-Tyne Electric Supply ordinary 1s. 3d.

POSTAL TELEGRAPH AND CABLE CORPORATION.—Regular qrtrly. div. of 1¾% on 7% non-cum. pfd. stk. will be payable on April 1.

PETERBOROUGH ELECTRIC TRACTION CO., LTD.—Net pft. for 1928, £4 309, agst. £5 464. Brt. in, £4 255. Div. on 6% pref. shs., £1 320; div. on ord. shs. at rate of 10% p.a., £2 500. Fwd., £4 232.

BRUCE PEEBLES CO., LTD.—Dirs. recmd. pmt. of fixed pref. div., at rate of 7½%, less tax, for hlf.-yr. to Dec. 31, and div. of 5%, less tax, on ord. shs. for yr. Transferred from gen. res. to pft. and loss, £10 000.

CHATHAM AND DISTRICT LIGHT RAILWAYS CO.—Net pft. for 1928, £4 153 (agst. £5 198, after provisn. of £4 500 for deprctn. last yr.). Brt. in, £1 259. Fwd., £5 412. No div. (agst. 5% on pref. and 2½ % on ord. last yr.).

DAVIS AND TIMMINS, LTD.—Net pft. for 1928, £23 417, agst. £6 639, plus inc. tax blce. £578 and £18 168 brt. in. Blce. div. at rate of 16¼% on ord. shs., makg. 20% for year, less tax, agst. 8%, tax free. Written off new issue exes., £2 379. Fwd., £21 316.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO., LTD.—Net pft. for 1928, £106 044, plus £112 618 brt. in. Intm. div. 2½%, paid July 12, 1928, required £22 410, leavg. £196 353. Directors propose further div. of 7½%, tax free; to res. £15 000; fwd. £114 123.

RADIO AND GRAMOPHONE MERGER.—His Master's Voice Gramophone Co. has entered into an agreemt. to acquire the Marconiphone Co., Ltd., and the right to use present and future Marconi patents and inventns. in all fields of public entertainment and education.

BRITISH INSULATED CABLES LTD.—It is proposed to pay fin. div. for 1928, of 10%, makg. 15% (unchanged), plus 25% bonus in ord. shs. and 37½% bonus in new 5½% cum. A pref. shs.; to res. and depreciatn., £400 000 (agst. £300 000); fwd., £250 000 (agst. £305 880).

WAYGOOD-OTIS, LTD.—Pft. for 1928, after deductg. res. for depreciatn., etc., £77 254, agst. £68 115. To res. for contingencies, £30 000, and res. for pensions, £6 000. Net income, £41 254. Fin. div., 7½% on ord. shs., makg. 10% for year (same as last year). Fwd. £15 570, agst. £12 315.

MIDLAND ELECTRIC MANUFACTURING CO., LTD.—Net pft. for 1928 £43 402, agst. £39 360, plus surplus on realisatn. of investmts., £5 250, and £14 314 brt. in. Div. on pref. shs. takes £4 500, and dir. prpse. div. of 10% on ord. shs., less tax, and bonus of 25%. To gen. res., £24 274. Fwd., £13 192.

TILLING-STEVENS MOTORS, LTD.—Pft. for 1928, £81 105; agst. £124 899, plus £8 169 brt. in. On Sept. 1 last div. on acct. of half-year to June, 1926, was paid on pref. shs. It is now proposed to place £10 000 to depreciatn. res., £7 500 to res. for contingencies, and £9 500 to res. for taxation and to pay further div. on pref. shs. for half year ended Dec., 1926.

ALUMINIUM CORPORATION, LTD.—A mtg. of deb. hldrs. on Monday approved proposed sale of hydro-electric porcn. of co.'s undertaking to North Wales Power Co., and, at subsequent mtgs., ord. and pref. shhlders. approved resolutions to reduce cap. from £1 000 000 to £808 058, to convert. £1 pref. shs. into 10s. ord shs., to cancel pref. div. arrears, and to increase cap. to £1 000 000 in 10s. shs.

ENGLISH ELECTRIC CO., LTD.—Net pft. for 1928, after makg. usual provisns. and charging expenditure during year on tools, patterns, drawings, etc., £86 292, agst. a loss of £12 237. Int. on debs. and deb. stk. and transfer fees require £119 908, agst. £122 167; net loss £33 616, agst. £134 404. Debit blce. brt. in is increased to £433 516. Div. on pref. cap. in arrear fm. June 30, 1926.

SCOTTISH POWER CO.—Tradg. pfts. of undertakgs. controlled by co., for 1928, £116 659, agst. £99 449. Res. by the cos., £22 522, agst. £35 855, blce. being paid to Scottish Power Co., accts. of wh. show blce. of £85 840, after mtg. exes, and incldg. £3 253 brt. in. After provisn. for deb. int., div. on pref. cap., and £970 for deb. redemptn., and placing £4 466 to res., div. of 8% on ord. shs. is prpsd. Fwd. £3 399.

BRITISH COLUMBIA POWER CORPORATION.—Net earngs. for six months ended Dec., 1928, £441 479. The corporation, which was formed to take over, as from July 1 last, the whole undertakg. then owned by the British Columbia Electric Railway Co. and its subsidiaries, and whose control was

Digitized by Google

transferred from London to Canada, announces decrease of $61 747 (£12 731) in working exs. for Dec., 1928, as compared with Dec., 1927. Net income shows increase $36 190 (£7 462). Six months' workg. to Dec. 31, 1928, shows net earngs. £441 479, increase £50 676.

CITY OF LONDON ELECTRIC LIGHTING CO., LTD.—Total income for 1928, £798 926, rev. carried to net rev. acct. £451 588 after deducting expenditure. Int. on deb. stks. and on loans, deposits, etc., transfers to sinking funds and contingency fund, etc., absorbed £208 880, and, after adding int. on investmts. and discts. on purchases, net rev. w.s £253 341. Divs. paid on 1st and 2nd pref. and ord. shs. in Sept. last required £84 000, one-sixth of consumers' benefit placed to special res. £45 990, and amount apportioned to benefit of co-partners £31 695. Balance divs. recommended, making total distribution for year of 6% on 1st pref., 8% on 2nd pref., and 10% on ord. shares, less tax.

LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Sales in 1928 yielded £692 506, agst. £678 487, total rev. includg. sundry income, being £708 542, agst. £693 927. Purchase of current absorbed £448 601, compared with £358 424, total expenditure being £529 662, agst. £442 713, leaving a pft. of £178 880, compared with £251 214. With £19 709 brt. in and int. from investmts., etc., amt. available was £36 663' and after deductg. int. charges, £23 494, and providing for sinking funds, £30 552, blce. available is £181 206, agst. £127 594. After mtg. divs. on pref. shs., board recommends fin. div. on ord. shs. of 5%, makg. 9%, agst. £4 8s. 6-6-7d. To special reserve—ord. shldrs' benefit under sliding scale for 1926, 1927 and 1928, £50 880. Fwd. £25 437.

G.E.C. Issue.

GENERAL ELECTRIC CO., LTD.—In our last issue (on page 309) we published an announcemt. that on March 13 a mtg. wld. be held to consider a resolutn. to increase the cap. by the creatn. of 1 600 000 new £1 shs. and providing that such shs. shld. only be issued to British investors, and other resolutns. incidental to the scheme. The Co. has since received a cablegram from New York from a committee of holders of a substantial number of the co.'s shs. represented by the certificates issued by the Guaranty Co. of New York, protestg. agst. the action proposed to be taken and stating that if the proposal were carried out it would deprive the foreign hldrs. of these certificates of a substantial property interest. Sir Hugo Hirst, in reply, states that about 60% of the ord. shs. are in American hands. The board believes the committee's protest is due to a misunderstandg. of the proposal. The new issue is being made to the British public generally. When the debs. are redeemed £60 000 additionally will be available for the benefit of ord. shhldrs., regardless of their nationality, and any benefits such as possible increased divs. or cap. bonuses will always belong to all proprietors, without distinction. At the meeting on Wednesday, Sir Hugo Hirst said the reason for this increase of cap. was primarily due to their desire to redeem the outstanding debs. as soon as possible. It had always been his ideal that some day the G.E.C. might mean to the people of this country what the G.E. meant to the people of America and the A.E.G. or Siemens to the people of Germany. On returning from a six months' trip to Australia, he found that considerably more than half their ord. shs. had wandered across the Atlantic, and they realised that they had been deprived of 60%, if not more, of their ord. shhldrs.—that very body to whom they looked for support in their home market, which represented 70 or 75% of their business. It was vital that the British character of the company shd. be preserved, and that their shhldrs. shd. include a considerable percentage of subjects of the British Empire, who played a great part towards securing continuity of employment for the company's 25 000 workers. It was for these reasons alone that it was proposed to confine the present issue to the British Public. They had sold 1 500 000 shs. to the British, Foreign and Colonial Corporation at £2 per sh., leavg. them to allot them at a price not exceedg. £2 2s. p. sh. There was some oppositn. on behalf of the American shhldrs., but the resolutns. were carried by an overwhelmg. majority.

Company Meetings.

CHARING CROSS AND STRAND ELECTRICITY SUPPLY CO., LTD.—At the meeting last week, Mr. W. F. Fladgate (chairman) said in their business last year there had been movement in every department, and he thought that practically in every case it had been in the right direction. In 1928 they sold nearly 65 000 000 kWh, an increase of over 4½ millions. Net revenue increased by over £60 000, and the carry forward was £97 900, an increase of £61 900. On the debit side the most interesting factor had been the reduction in the price of energy. In 1927, 72 000 000 kWh cost £298 000, while in 1928 they paid only £214 000 for 78 000 000 kWh. This had been brought about by the economies which the London Power Co. had been able to accomplish. He had every hope that further economies would be brought about when their new stations at Deptford and Battersea were working. Decrease in the price of coal was a factor in this, but not to a greater extent than 40%, the remaining 60% being caused by economies and efficiency in working rendered possible under the scheme of the London Power Co.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—Sir James Devonshire, presiding at the general meeting, said the past year showed a continuance of that steady progress and development of the company which commenced after the readjustment upon the change over from war conditions, and had characterised the record of the company since then. The service of the company had increased from 143 million to 164 million kWh, an increase of 14%. Consumers supplied, either directly or indirectly, increased from 85 000 to over 99 000, representing 17 per cent. The total length of trunk and distributing mains at the end of the year was 1 294 miles, served by 311 sub-stations. The directors were recommending a dividend upon the ordinary shares of 10% for the year (on account of which an interim dividend of 4% had already been paid), leaving £28 202 to be carried forward, or £9 000 more than the amount brought in. At the new generating station at Brimsdown, a number of special features were introduced. The number of their consumers who had purchased their own electric cookers had more than doubled since 1926; electric cooking was becoming a pnblic habit, and the rapid growth in this direction was largely due to the fact that those who had adopted electric cooking were so satisfied that, perhaps unconsciously, they became their best canvassers. Last year, 228 000 separate accounts were rendered in connection with electricity supply, sales of electrical apparatus and for installation work carried out by the staff, and resulted in a total revenue exceeding 1 000 000.

Popularity of Two-Part Tariff.

METROPOLITAN ELECTRIC SUPPLY CO., LTD.—Mr. George Balfour, M.P., presiding at the meeting on March 6th, said the increase in consumption and in the number of consumers who had adopted their two-part tariff indicated that it would soon largely supersede the old flat rate. It had resulted in an average increase of 20% in consumption of electricity by those consumers who had adopted it. They had now the greater part of their transmission cables underground on a system of ring mains to give duplicate main transmission to nearly all their customers. The length of high and low tension cables was 621 miles. The output from the sub-stations was 126 000 000 kWh, compared with 106 500 000 for the previous year, an increase of a little over 18%. Of this total, 42 100,000 kWh were sent out in the London area, and 83 900,000 in the Western area. He had had the figures worked out showing the cost of their supply, based on conservative calculations of the cost of operating Willesden power station and allowing 8% on the total capital expenditure of Willesden at the date they sold it, and including a like interest on an additional £570 000 for any extensions to meet their requirements since the date of sale. This brought out an overall cost for operating, management, interest, etc., to £341 127, compared with £387 581 paid to the London Power Co. last year for electrical energy. A final dividend, making a total of 9% for the year, was approved.

WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.—Lord Wargrave, presiding at the annual meeting, said the cost of current purchased was £7 000 higher, but they had purchased 5 000 000 more units. An increase of £11 000 was shown in receipts from sale of current, and revenue continued to grow notwithstanding continual reductions in charge for current to consumers. The output increased by 5¼ million kWh. The standard prices, applied to the figures for 1926, 1927, and 1928, showed that the consumers had received benefits in those years amounting to £188 787, and there had accrued to the ordinary shareholders £28 608, representing their proportion of the consumers' benefit for the three years. In 1891, the company sold 627 000 kWh at an average price of 7½d. At the end of 1928 the annual output had grown to 60 000 000 kWh, and the average price charged had dropped to 2·3d. per kWh unit. This compared with the *maximum*

Digitized by Google

price of 8d. authorized under their Provisional Orders and the standard price for private consumers of 2¾d. Practically the whole of the company's output was represented by supplies to private consumers, and it was only by keeping tariffs down to the minimum that this result had been obtained. The price charged for a.c. lighting supplies was now 3¾d., and they had also the low rate of ½d. for cooking and water heating. The company was one of the pioneers in introducing a rate of 1d. per kWh for current used for heating, and this had been in operation for over 20 years. There was no evidence in these figures of the consumers being exploited for the benefit of the shareholders. For the current year he thought the prospects were good.

Torquay Tramway Co., Ltd.—At the recent general meeting, Mr. H. T. Barnett (chairman) said traffic revenue for year was £63 649, against £61 624. Profits for the year added to the amount brought forward, were £15 285, the same as for 1927. An interim dividend of 4 per cent., tax free, was paid in August, 1928, leaving £9 285 to be dealt with. The directors recommended a final dividend of 4 per cent., and a bonus of 1 per cent., tax free, for the year, carrying forward £1 785.

Midland Counties Electric Supply Co., Ltd.—Mr. George Balfour, M.P., presiding at the meeting last week, said shareholders would remember that they were carrying on a certain amount of traction business in addition to their electricity supply undertakings. Last year he told them that the traction enterprises were passing through a bad time. Their Bill in Parliament, dealing with their largest traction interest, had become an Act of Parliament, and they were engaged in dealing with the smaller undertakings in a similar manner. They had applied their minds to the consolidation of the services, and he was glad to report considerable improvement, in consequence of the reasonable degree of security they had obtained. Gross receipts were £723 500, of which nearly 85% was derived from electricity supply. Last year they sold 133 596 000 kWh, an increase of more than 29 millions over the year 1927. They connected 5 385 new consumers last year, making a total of 20 577. The additional load amounted to 19 676 kW, bringing the total connected load to 105 300 kW. The maximum load on the generating plant was 42 910 kW, in addition to 2 000 kW purchased. Extensions were carried out to give supplies to two urban districts and 39 rural parishes which had not hitherto been served. They were now supplying in three boroughs, 26 urban districts and 134 rural parishes, in addition to supplies in bulk for ten local authorities and company undertakings. All their generating stations had been classified as selected stations under the Central England scheme. At Spondon a 25 000 kW set was in course of erection. The report and accounts were adopted, the payment of the dividend on the preference shares for the year was confirmed, and the proposal to pay a dividend of 6½% on the ordinary shares was approved.

Marconi International Marine Communication Co., Ltd.—Mr. F. G. Kellaway, presiding at the meeting on Monday, said the balance of the profit and loss account was £193 420 6s. 7d., compared with £179 730 8s. 7d. for 1927. There was brought forward from 1927, £23 677 10s. 1d., from which directors additional remuneration voted at the last annual general meeting was taken, bringing the figure to £22 177 10s. 1d. This carry-forward, together with the profit for the year of £193 420 6s. 7d., left a total of £215 597 16s. 8d. available for distribution. An interim dividend of 7½% had been paid, and the board recommended a final dividend of 7½%, making a total for the year of 15% and enabling them to carry forward £36 689. Designs of ship wireless telegraph and telephone apparatus had been made to meet the new requirements, and this year they were being offered at prices which approximated very closely to the standard figures for spark outfits. The reports from nearly 1 000 ships equipped with the company's four second auto-alarm device had been carefully analysed, and they were satisfied that their device had an efficiency of not less than 90%, with prospects of improvement as further experience was gained. The wireless direction-finder was being employed to an increasing extent. Another feature of 1928 was the increase in the use of wireless on trawlers. To date there were 191 trawlers and drifters carrying the company's apparatus. Under the arrangement which had been made with the Gramophone Co., that company acquired the Marconiphone Co.'s business, and the wireless company would no longer be directly concerned with wireless in its application to the entertainiment and educational fields. In the future, as a part of the wireless and cable merger, it would confine its activities to research and invention in wireless generally, to its manufacturing business as carried on at Chelmsford, and to the development of its traffic services. The report was adopted and the dividends were approved.

Underground Electric Railways Co. of London, Ltd.—Presiding at the meeting on March 7th, Lord Ashfield (chairman) said the London built up area was reaching out in long stretches of houses to the 12 mile limit from the centre, and the problem of planning for the conveniences of these new colonies grew yearly more difficult. So far as receipts were concerned he could foresee nothing which need induce them to pause or to have doubt as to their future. In the last five years, although the index number for the cost of living had fallen from 180 to 167 points, they had slightly increased the average wage paid to their staff; the increase being 6%. They had achieved this result by two means. They had received better service, and had enabled that better service by putting at their disposal the best equipment and machinery that they could obtain. They would have this year to find another £200 000 to meet their petrol bill, assuming that no further advance in price would occur. In last year the transport undertakings in which they were interested paid in rates and taxes £978 000. It was about one-quarter of the net traffic receipts remaining after meeting working expenses. To be taxed at the rate of 25 per cent. upon the real earnings was grievous and far exceeded the charge upon any other industry. The volume of passengers grew. The demand for further facilities became insistent. Just now they had committed their subsidiary companies to the task of seeking from Parliament powers to enable them to enter into agreements on a much wider basis than hitherto for the co-ordination of all the local passenger transport facilities within the London traffic area, in such a fashion that a more certain sense of security would be enjoyed by them all, thus enabling them to raise additional capital for extensions on satisfactory terms. The Bills in no way destroyed or impaired the responsibilities and obligations of those who now owned or controlled the various means of transport. The common management must be the servant of the owners, discharging in full on their behalf all their responsibilities and obligations. The report was adopted, and the final dividend of 4% on the ordinary shares, making 7% for the year, against 5% for the previous year, was approved.

METAL AND CHEMICAL PRICES.

Deeds of Arrangement.

HUGHES, William, James Street, and Sandy Lodge, Great Orme's Road, Llandudno, electrician. Dated March 9th, filed March 11th. Trustee, J. H. Jones, 69, Mostyn Street, Llandudno, accountant. Secured creditors, £115; liabilities unsecured, £211; assets, less secured claims, £145.

WOODHEAD, Reginald, Main Street, Hathersage, and ASH, Bertram, 74, Doe Quarry Lane, Dinnington, and trading at 31, Church Street, Rotherham, as WOODHEAD BROS., electrical engineers. Dated March 8th, filed March 9th. Trustee, A. Arthur, Imperial Buildings, Rotherham, I.A. Secured creditors, £268; liabilities unsecured, £2 597; assets, less secured claims, £1 115.

YARNIT, Thomas Howard, trading as ELECTRICAL INSTALLATION CO., 25, St. Mary's Row, Moseley, and residing at Belgrave Road, Birmingham, electrical contractor. Dated February 27th, filed March 6th. Trustee, J. W. Blackham, 147, Corporation Street, Birmingham, I.A. Secured creditors, £6; liabilities unsecured, £523; assets, less secured claims, £82.

Receivership.

ELECTRICAL APPLIANCES (BLACKPOOL), LTD. W. B. Haworth, of 35, Cookson Street, Blackpool, was appointed receiver and manager on February 19th, 1929, under powers contained in debenture dated April 10th, 1928.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

MAUGHAN (J. L.) AND CO., LTD., Newcastle-on-Tyne, electrical engineers. Registered February 22nd, £3 000 (not ex.) debenture, to Stella Conduit Co., Ltd., Highfield Works, Bilston; general charge. *£1 950. February 2nd, 1928.

MIDHURST AND DISTRICT ELECTRICITY CO., LTD., London, W.C. Registered January 29th, debenture for £5 000, and further advances with premium of 5 per cent., to Johnson and Phillips, Ltd., Columbia House, Aldwych, W.C.; general charge.

RUSHDEN AND DISTRICT ELECTRIC SUPPLY CO., LTD. Registered February 20th, £550 and £450 debentures, part of £50,000; general charge. *£25 000. March 6th, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

SADLER (THOMAS) LTD., Canal Street, Stockport, electrical engineers, etc. The statutory meeting of the creditors in the voluntary winding-up of this company was held recently at the offices of Frank Harrop and Co., I.A., Palatine Bank Buildings, Norfolk Street, Manchester. Mr. F. Harrop, the liquidator, submitted a statement of affairs which disclosed ranking liabilities of £1 288, and assets estimated to realise £61, subject to preferential claims of £20, or a deficiency of £1 247. The issued capital is £238, and as regards the shareholders, the deficiency is £1 485. It was reported that the company was registered in February of last year, to take over an existing business. The company had a nominal capital of £500 in £1 shares, of which £238 had been issued and were fully paid. It was pointed out that the turnover since the incorporation of the company had been something like £2 000, and that there had been a gross loss of approximately £300. The expenses in the same period had totalled £723, and the deficiency was accounted for by those two items, together with the depreciation written off the assets in the statement of affairs. Mr. T. Sadler was a creditor for £324, representing monies advanced to the company from time to time.

London Gazette, etc.

Company Winding-up.

WHITFIELD ELECTRICAL CO., LTD.—Winding-up Order, March 5th.

Notices of Dividend.

DAVIES, John Arthur, of "Eureka," Church Street, Blaenau, Festiniog, Merioneth, electrical contractor. First and final divi, dend, 3s. 5¾d. per £, payable March 20th, Official Receiver's Office-St. Peter's Churchyard, The Cross, Chester.

KELLY, Stanley Sherzell, 59, North Road, Durham, electrical contractor. First and final dividend, 1s. 7½d. per £, payable March 18th, 2, Sackville Place, Newcastle-upon-Tyne.

PACIFICO, Alexander Pacy, PACIFICO, Jack Pacy, and FEITELSON, Raphael, trading as THE COMTON WIRELESS MANUFACTURING CO., 26-28, Bartholomew Square, Old Street, E.C.1. First and final dividend, 1s. 0½d. per £, payable November 16th, at the offices of Messrs. Corfield and Cripwell, 119, Finsbury Pavement, E.C.2.

Bankruptcy Proceedings.

BUCKLEY, Harry, electrician, 23, Asylum Road, Old Kent Road, London, S.E. A sitting for the public examination of the debtor was appointed in the London Bankruptcy Court on Wednesday of last week, his statement of affairs showing a liability of £1 932 and assets £6. He has attributed his failure and insolvency to his liability under judgment obtained by the petitioning and only creditor for moneys had and received, but he has denied that he received any consideration for the judgment debt. The Official Receiver said that the case was before the Court a week previously when the debtor failed to submit himself for examination, and an order was made ordering the examination to stand over for a week. The debtor had not been in attendance that day although his (the Official Receiver's) examiner had been waiting for him throughout the morning. In these circumstances it was submitted that the examination now be adjourned *sine die*.

This application his Honour granted.

LEE, Edward Francis (trading as FRANCIS NEWTON) electrical engineer, 340a, King's Road, Chelsea, London, S.W. The debtor, who filed his petition on February 22nd, has carried on business as a builder, decorator and electrical engineer. At the statutory first meeting of his creditors it appeared from statements that have been made by the debtor that he resigned his commission in the Army in July, 1926, receiving a gratuity of about £1 000, and, after payment of his personal debts, was left with a capital of £700. He then entered into partnership with another person, and they began business under the style of Francis Newton, builders and electrical engineers, at the above address, which premises they took at a rental of £180 a year. But business from the inception of the partnership proved very poor, and they found that it was insufficient to carry two partners, with the result that in July last the partnership was mutually dissolved. The debtor took over all the assets and liabilities, paying his partner £25 on retirement, and has since traded alone. Creditors have, however, recently been pressing him, and on February 16th last he closed the business. The debtor attributes his failure to bad debts, to heavy overhead expenses and to bad trade. The meeting was closed, and the case remained in the hands of the Official Receiver as trustee in bankruptcy for summary administration, the debtor's statement of affairs showing liabilities £372 and assets £60.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

305 109 B. Hesketh. Frame aerials as employed in the art of wireless telegraphy and telephony. (27/9/27.)
305 055 British Thomson-Houston Co., Ltd., H. Pearce, and E. D. Regis. Electric switchgear. (29/9/27.)
305 250 R. A. W. Watt and L. H. Bainbridge-Bell. Apparatus adapted for use in radio-telegraphic direction-finding and for similar purposes. (3/10/27.
305 058 A. A. Linsell. Electromagnetic reproducing and recording devices for gramophones. (25/10/27.)
297 093 Weston Electrical Instrument Corporation. Electrical indicating instruments. (16/9/27.)
305 063 Edison Swan Electric Co., Ltd., and L. H. Soundy. Thermionic valves. (16/10/27.)
305 084 W. E. Beatty (Bell Telephone Laboratories, Inc). Coating articles. (26/10/27.)
305 251 C. S. Franklin. Thermionic valves. (28/10/27.)
305 085 W. E. Beatty (Bell Telephone Laboratories, Inc). Methods of an apparatus for covering cores, particularly applicable for insulating cables. (29/10/27.)
305 069 A. Reyrolle and Co., Ltd., and N. Cooke. Electric relays. (29/10/27.)
279 899 Siemens and Halske Akt.-Ges. Push-pull connection for thermionic and like valves. (30/10/26.)
305 073 A. Whitaker and Gramophone Co., Ltd. Microphones. (29/10/27.)
305 074 W. H. Eccles, A. Whitaker and Gramophone Co., Ltd. Means for controlling the intensity of a beam of light for use, for example, in recording sound. (29/10/27).
305 075 A. H. Marks and P. Russell [legal representatives of E. R. C. Marks (deceased)] (J. A. L. Horn). Telegraphic receiving and transmitting apparatus. (29/10/27.)
305 156 P. C. Saccaggio. Electric power-transmission controllers for locomotives and other vehicles. (1/11/27.)
305 158 Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. Telephone systems. (1/11/27.)
280 893 Aktiebolaget Separator. Milking machine having electrically controlled pulsations. (17/11/26.)
305 256 Siemens Bros and Co., Ltd., W. E. Goodwin, and F. Baker. Electrical terminal boards. (2/11/27.)
305 284 W. E. Beatty (Bell Telephone Laboratories, Inc.) Electrical coupling-circuits for transmitting voice and like complex-frequency currents. (7/11/27.)
280 565 Siemens and Halske Akt.-Ges. Telephone systems with amplifiers (15/11/26.)
305 296 British Thomson-Houston Co., Ltd., C. J. Morton, and T. H. Woodfield. Electric junction boxes. (14/11/27.)
305 302 C. A. Vandervell and Co., Ltd., R. C. Paterson, and P. J. Beddows. Pasting of electric accumulator plates. (17/11/27.)
282 368 R. B. Hunter. Method of and means for controlling polyphase induction motors. (15/12/26.)
305 318 W. A. Coates, J. Fowler, and Metropolitan-Vickers Electrical Co., Ltd. Tap-changers for electric transformers. (1/12/27.)
305 322 R. K. Hezlet, V. E. A. Pullin, and A. G. Warren. Radiographic apparatus. (3/12/27.)
282 074 British Thomson-Houston Co., Ltd. Combined automatic and manual electric circuit-controllers. (13/12/26.)
305 327 H. Bold. Electrically driven time-pieces. (10/12/27.)

Applications for Patents.

January 24th.

2 434 A. W. and H. B. Arden. Magnetic pointer device for wireless apparatus.
2 449 R. L. Aspden. Television, etc., apparatus.
2 535 Associated Telephone and Telegraph Co. Telephone systems. (7/1/27, U.S.)
2 519, 2 520, 2 521 H. H. Berry. Electric fires.
2 461 Birtman Electric Co. Vacuum cleaners. (4/2/28, U.S.)
2 507 British Thomson-Houston Co., Ltd. Signalling systems. (24/1/28, U.S.)
2 508 British Thomson-Houston Co., Ltd. Electrodes for electric discharge. devices. (2/3/28, U.S.)
2 470 W. M. Crawfurd, and Siemens Bros. and Co., Ltd. Junction box for electric cables.
2 499 Ferranti, Ltd., and A. Hall. Volume control devices for radio receiving apparatus.
2 500 Ferranti, Ltd., and A. Hall. Radio receiving apparatus.
2 416 Kapella, Ltd. Pedal-operated electric switches.
2 471 Siemens Bros. and Co., Ltd. (P. E. Cheeseman.) Insulation of conductors.
2 514 G. Somajni. Electric control apparatus. (31/1/28, Italy.)
2 501 R. W. Strange. Television. (25/1/28, Australia.)
2 474 Vereinigte Gluhlampen und Electricitats A.G. Recording phenomena by means of cathode rays. (1/2/28, Hungary.)

January 25th.

2 557 W. Aitken. Telephone switching systems.
2 591 Akt. Ges. Brown, Boverie et Cie. Electric rectifiers. (13/2/28, Germany.)
2 668 A. Heyland. Starting synchronous motors.
2 574 C. Lorenz Akt. Ges. Method of wireless transmission. (26/1/28, Germany.)
2 638 K. Manger. Electric lighter for pipes, etc. (27/1/28, Germany.)
2 588 Sir G. C. Marks (Belden Manufacturing Co.). Electric connector plugs.
2 589 Sir G. C. Marks (Western Electrical Instrument Corporation). Testing vacuum tubes.
2 596 Metallges Akt. Ges. Electrical conductors. (25/1/28, Germany.)
2 682 J. Moison. Electrical ringing device for church bells.
2 674 P. S. Newbound. Terminals for conductors.
2 678 H. J. Osborn and A. Wright. Controlling electric circuits.
2 621 C. J. R. H. von Wedel. Electron discharge tubes.
2 662 A. West and Co., Ltd. Tripping mechanism for electrical switches.
2 663 A. West and A. West and Co., Ltd. Electric switchgear.
2 664 A. West and Co., Ltd., and F. Bergmann. Electric control systems.
2 634 M. de Wrangell. Combined electric and mechanical motor control for phonographs. (27/1/28, France.)

January 26th.

2 757 Cambridge Instrument Co., Ltd. Electrical measuring instruments, etc
2 758 Columbia Gramophone Co., Ltd. Supports for electrical reproducing devices.
2 750 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Battery charging systems.
2 756 S. Z. de Ferranti. Electric radiator fires.
2 772 P. Freedman. Thermionic valves.
2 718 M. H. Goldstone. Insulated lampholders.
2 744 S. Lyle (H. B. Lyle). Electrical pick-ups, etc.
2 688 J. W. C. S. Northcote. Moving coil for loud speakers, etc.
2 760 E. Pacilli. Electrodynamic operation of railway switches, etc.
2 748, 2 749 J. E. Pollak (Associatfd Telephone and Telegraph Co.). Call recording apparatus for telephone systems.
2 787 Radiovisor Parent, Ltd. Controlling automatic instruments, etc.
2 781 Siemens-Schuckertwerke A.G. Electric cables. (26/1/28, Germany.)
2 731 B. A. Spaull. Incandescent lamp holders, etc.
2 757 C. D. Sutton. Electrical measuring instruments, etc.

January 28th.

2 848 English Electric Co., Ltd., and J. O. Wilson. Dynamo-electric machines.
2 839 General Electric Co., Ltd., G. A. Gaw, and C. W. Wilman. Telephone systems.
2 919 V. H. Gilbert, A. Johnson, and Radiovisor Patent, Ltd. Measurement of electric currents, etc.
2 857 International General Electric Co., Inc. Single-phase transformers. (28/1/28, Germany.)
2 859 International General Electric Co., Inc. Vacuum cleaners. (28/1/28, U.S.)
2 912 A. C. Johnson. Remote control of electric lamps.
2 794 Loewe-Radio Ges. Armatures for electrical sound boxes. (27/1/28, Germany.)
2 815 C. Lorenz Akt.-Ges. Arrangement for suppression of self-capacity of conductors. (28/1/28, Germany.)
2 922 N. W. McLachlan. Thermionic amplifiers for gramophones, etc.
2 911 T. G. Mair. Electrical couplings, etc.
2 850 Q. Marino. Electro-leposition of zinc. (28/1/28, France.)
2 851 Q. Marino. Electrochemically cleaning iron, etc. (28/1/28, France.)
2 884 Mullard Radio Valve Co., Ltd. Sound reproducers.
2 898 Akt.-Ges. C. H. F. Muller. X-ray tube installations. (26/1/28, Germany.)

COMING EVENTS.

Friday, March 15th.

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. C. F. J. Morgan on "Wave-form Analysis," 6.15 *p.m.*

Institution of Civil Engineers, Institution of Electrical Engineers, and Institution of Mechanical Engineers.—Windsor Room, Grand Hotel, Birmingham. Annual joint meeting. Discussion on "A Hydro-Electric Power Station." 7 *p.m.*

British Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Water Heating Developments." Speaker, Mr. M. O. F. England. 7.30 *p.m.*

Saturday, March 16th.

Association of Mining Electrical Engineers (Western Sub-Branch).—60 Wind Street, Swansea. Informal discussion of H.M. Electrical Inspector of Mines, Report for 1927.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford on "Molecular Motions in Rarefied Gases." 3 *p.m.*

Electrical Power Engineers' Association.—New Princes Galleries, Piccadilly London. Dinner and dance. 7 *p.m.*

Monday, March 18th.

Electrical Association for Women (Manchester District Branch).—Visit to the Hyde Road Tramways Department. 2.30 *p.m.*

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Method in Invention." (Opened by Mr. C. Turnbull.) 7 *p.m.*

Institution of Electrical Engineers (Mersey and North Wales—Liverpool—Centre).—The University, Liverpool. Paper by Mr. E. Y. Robinson on "Radio Sets on the Mains." 7 *p.m.*

Tuesday, March 19th.

Association of Supervising Electrical Engineers.—43, Russell Square London. Annual general meeting.

Institute of Transport (Birmingham and District Section).—Queen's Hotel. Paper on "Transport on Inland Navigations—Its Advantages and Limitations." By E. W. Bayliss. 6 *p.m.*

Illuminating Engineering Society.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Paper on "Architectural Lighting," by Mr. Waldo Maitland. 7 *p.m.*

Institution of Electrical Engineers (East Midland Sub-Centre).—Town Hall, Loughborough. Joint meeting with the South Midland Centre. Faraday lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things." 6.45 *p.m.*

Electrical Association for Women.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Lecture on "Some Elementary Facts Concerning Electric Motors," by Mr. H. Bourne. 7 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—17, Albert Square, Manchester. Papers by Messrs. T. N. Riley, and T. R. Scott on "Electrical Insulating Papers for the Manufacture of Power Cables," and Messrs. S. G. Brown, F.R.S., and P. A. Sporing on "The Prevention of Ionisation in Impregnated Paper Dielectrics." 7 *p.m.*

Wednesday, March 20th.

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.

Polytechnic School of Electrical Engineering.—307–9, Regent Street, London. Lecture VII (course of eight lectures) by Mr. E. S. Ritter on "Picture, Telegraphy." 5 *p.m.*

Overhead Lines Association.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Paper by Mr. A. Lennox Stanton on "Some Notes on the Labours of the Hydro-Electric Commission of Ontario." 5.30 *p.m.*

Institution of Electrical Engineers (Tees-Side Sub-Centre).—Cleveland Technical Institute, Middlesbrough. Paper by Mr. R. W. Gregory on "Electric Supply to the Rural Districts of England." 7 *p.m.*

Institution of Electrical Engineers (Sheffield Sub-Centre).—Mappin Hall, St. George's Square. Paper by Prof. W. Cramp on "The Cause and Effect of Oscillation in Electrical and Mechanical Apparatus." 7.30 *p.m.*

Thursday, March 21st.

Institution of Electri cal Engineers.—Savoy Place, Victoria Embankment London. Papers by the Hon. Sir C. A. Parsons, F.R.S., and Mr. J. Rosen on "Direct Generation of Alternating Current at High Voltages," and Mr. J. A. Kuyser on "Recent Developments in Turbo-Generators." 6 *p.m.* Preceded at 5.30 *p.m.* by a demonstration by Mr. R. T. Coe, of a portable electric harmonic analyser. 5.30 *p.m.*

Institute of Patentees.—Caxton Hall, Westminster, London. Paper by Mr. C. Davis on "Russia and its scope for the British Inventor." 8 *p.m.*

Friday, March 22nd.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Annual general meeting. Presidential address by Dr. W. H. Eccles, F.R.S. 5 *p.m.*

Royal Institution.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford, F.R.S., on "Penetrating Radiations." 9 *p.m.*

Saturday, March 23rd.

Royal Institution.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford on "Molecular Motions in Rarefied Gases." 3 *p.m.*

Paisley Association of Electrical Engineers.—Visit to Messrs. The Clyde Valley Electrical Power Company's hydro-electric power station at Bonnington, Falls of Clyde. 3 *p.m.*

Association of Mining Electrical Engineers.—South Wales Institute of Engineers, Park Place, Cardiff. Paper by Mr. C. L. James on "Power Factor: Its Cause and Effect." 6 *p.m.*

Current Topics.

Developing the E.D.A.

In many ways the report submitted to the ninth annual general meeting of the British Electrical Development Association last Friday is encouraging and reflects real development on co-ordinated lines. The reorganisation of the Provincial Area Sub-Committees has achieved the objects of efficient decentralisation and increased local interest among members of the industry. Most of the sub-committees on special subjects can point to a year of progress, but the size of some of these bodies—the Electric Vehicle Committee has 39 members—seems unfavourable to much originality or despatch. It is difficult to see how an organisation like the E.D.A. can function without a good deal of committee work, but the tendency of such machinery to become clogged is a factor which should not be lost sight of where further specialised activities are receiving consideration. The chief campaign activity of the year was, of course, the factory and workshop lighting campaign, the excellent results of which are still fresh in the mind. The decision to discontinue further short-period special campaigns in favour of a continuous programme of activities, based on seasonal requirements has, we think, provided its own justification, and as time goes on should play an increasingly important part in stimulating and reinforcing individual selling efforts. The least satisfactory feature of the report is, as usual, the small extent to which the propaganda work, so necessary to all sections of the industry, is supported by financial contributions. Of the total revenue for 1928, supply undertakings provided 57% and the manufacturers 39·7%. The electrical contractors furnished 3% of the revenue, but the extent of the wholesalers' support was only 0·3%, a quota which hardly seems adequate in relation to the advantages derived. Apart, however, from questions of proportion as between the various sections, we have no hesitation in saying that a total revenue of less than £37 500 is not nearly enough, and that the Association requires not only additional members, but also bigger contributions from its existing members.

A "Coming-of-Age."

Our congratulations alike to the Institute of Metals and to its versatile president, Dr. Walter Rosenhain, F.R.S., of the National Physical Laboratory. The twenty-first birthday celebrations of the Institute extended from March 13th until March 15th, and at one of the meetings Dr. Rosenhain was able to point to the good work accomplished during the double-decade, in which the membership has increased from 250 to over 2 000. The results have proved of enormous practical value to the non-ferrous metal industries, and notable contributions have been made to the general advance in scientific knowledge. Among recent activities it is of interest that particular attention is being paid to the Corrosion Research Committee's activities by engineers and metallurgists in Germany. Indeed, a request that permission be granted for a reprint in German of all the eight reports issued by the committee has been acceded to, and a pamphlet, also treating of the work of condenser tube research, has been printed in Japanese. When the Institute was founded, scientific knowledge of non-ferrous metals as such did not exist, and the entire field of modern heat treatment has been discovered and developed since that date. In the evolution and perfection of the most important and invaluable processes the Institute of Metals has played an honourable and a prominent part.

Television Demonstrated.

In consequence of our remarks last week concerning the progress made with television, we received and accepted an invitation from Lord Angus Kennedy to witness a demonstration of the Baird system. The demonstration was given last Friday, and, though the form which it took was much the same as that adopted at the last National Radio Exhibition at Olympia, namely, over a metallic circuit, we were pleased to note a decided improvement in the received image. Most of the deep shadows so prominent in the last demonstration attended by us appear now to have developed into shadows of a type that one might reasonably hope to overcome by suitably "making-up" the "televisee." The picture, as it can at present be received by the Baird system is not perfect, but the results are, nevertheless, a distinct improvement on previous reception, and very encouraging. During the demonstration a group of four people was transmitted, and, considering the difficulties attaching to such a transmission, the results were remarkably good. Apart from the general movements of the subjects, the main details of the picture, such as the teeth, whites of the eyes, etc., could be observed.

Digitized by Google

Further, having seen a face by television one could recognise its owner in the flesh; this point is one of some importance, for it indicates that the distortion brought about by the transmission is not so serious as one might expect at this stage of development. We were given to understand that negotiations are now pending with a view to experimenting with transmissions by radio, and that when these are completed a further demonstration will be offered. Mr. J. L. BAIRD also gave a practical illustration of the virtues of the "Noctovisor"—an apparatus with which it is possible to see, as if in a lighted studio, a person sitting in a dark room. This device gave a result as clear as that of television, and is waiting further development. In conclusion, we would express the opinion that the ultimate success and perfection of television is dependent upon the close co-operation of those interested in the subject. Mr. BAIRD has done his share, and, as present results show, is still doing useful work; nevertheless, if the past is any indication of the future, such a subject can never be fully developed by a single mind. As in the early days of radio, new thought brought new ideas, and so must it be with television. Mr. BAIRD has made considerable progress so far, and one may ask the question: Is he to carry on, or will someone else show the way?

The Summer Meeting.

THE details which have now been issued of the itinerary of the I.E.E. Summer Meeting confirm the view that it will be one of the most interesting and attractive ever held. Starting in Paris, in and around which 4½ days will be spent, members will then have the opportunity to spend a week in the Pyrenees, and owing to the generosity of the Paris-Orleans and Midi Railways, who are providing free railway transport, the cost of this section of the trip will be particularly cheap. Already it is obvious that those who make a point of attending all the summer conferences and meetings will have a very busy time during June. The month opens with a week at the I.M.E.A. Convention at Torquay, followed, after a week-end interval, by the I.E.E. meeting in France for the next fortnight. Another short interval of two or three days permits recuperation from possible ill-effects of the Channel crossing before the journey is made to the E.C.A. Conference at Bournemouth as a pleasant end to the month. It is therefore to be hoped that other associations contemplating special summer activities will regard the month of June as one that is entirely unsuited to their purposes.

Electricity at the Seaside.

NOW that the widespread use of the petrol-engined road vehicle is fraying the nerves and poisoning the lungs of the long-suffering inhabitants of this country, we are threatened with a further development of uproar and fumes on our rivers and at seaside resorts by means of fast motor boats, which, we understand, are to be sold this year in large quantities at a popular price. We were glad to see in one of Wednesday's papers Mr. H. T. YOUNG'S protest against this outrageous proposal. As he rightly points out, "something should be done to prevent the roar and smell from these boats, or a day by the sea will become more harassing than a day in the City." If the public really desires non-manual means of propelling small craft on the water it should not be beyond the power of the electrical industry to provide a popular-priced electrically-propelled boat, which would give effortless progress without interfering with the enjoyment of others.

Medical Flippancy.

USED as we are to the conservatism so naturally displayed by the medical profession towards new curative forces, we are completely at a loss to understand why the Medical Research Council has denied in its latest report the value of artificial light treatment. Based only upon the experiments of one research worker, of which the full details are not available, this condemnation is not only sweeping, but flippant, when it declares that "artificial light can do no more than a mustard plaster, which is infinitely cheaper." It is true that the development of electro-medical appliances has coincided with the establishment of many "quack" practitioners who make totally unfounded claims for the apparatus which they employ. On the other hand, many hospitals and clinics have been using artificial light treatment for a number of years, at times with varying, but generally with definitely beneficial, results in the majority of the cases treated. It is not unreasonable to think that a form of treatment which has been employed by men of high repute in the medical profession to assist the King's recovery from his very serious illness must at least be worthy of a much more serious and prolonged investigation than it appears to have received at the hands of the Medical Research Council.

Two New Committees.

WE are glad to see that the two new committees which, have been appointed by the Electricity Commissioners to investigate certain aspects of electricity supply have been given a definite mandate to do something constructive and practical. One of these committees is to consider what steps could be taken to ensure that facilities for assisted wiring and for the hire and/or the hire purchase of apparatus are made available, wherever needed, to prospective consumers of electricity in rural and other areas of supply, and to make proposals for a practical financial scheme for the purpose. To the other body is allotted the task of considering the various kinds of charges and tariffs offered by authorised undertakers in connection with the supply of electricity for lighting, domestic, office and power purposes, and to make definite proposals whereby a greater measure of uniformity in respect of charges and tariffs could be brought about in the electricity supply industry. Both problems are of great and immediate concern to the industry, and the issue of the committee's proposals will be awaited with interest.

Monthly Accounts.

ALTHOUGH there are certain obvious difficulties in the way of introducing a system of monthly payments for electricity bought from electricity supply undertakings, the advantages of such a method over quarterly payments are so great that the matter would seem to merit more careful consideration than it has yet secured. The psychological factor involved is an important one. At any time of the year most people find it less difficult to find money to pay monthly accounts than those made up every three months, and when there are severe spells of cold weather, involving a greatly increased consumption of electricity, it is obviously desirable that consumers should pay for their abnormal requirements while the memory of the service rendered is still fresh in the mind. A system of monthly accounting would secure this end and would bring electricity supply into what Mr. H. W. ROBERTS has termed the housekeeping budget. Under such a system a substantial proportion of the extra trouble involved in the monthly reading of meters could be avoided by the use of outdoor meters.

Telephone Propaganda.

REFERENCE has more than once been made in these columns to the excellent work of the Telephone Development Association in increasing the use of telephones in this country. The Association has now incorporated in its publicity drive an attractive competition in which the public are offered cash prizes amounting to £200 for the nearest forecasts of the number of telephone subscribers who will be on the Post Office system on June 30th next. Although at a first glance a competition of this kind does not seem to be of much use in increasing the number of subscribers, closer inspection shows that the competition is ingeniously made to serve as bait for catching and leading public interest in the required direction. The latest statistics show a steady development of telephone usage during 1928, the total number of stations representing an increase of 7·8% for the year.

THE FACTOR OF SAFETY OF OVERHEAD LINES.

Variation in Strength of Constructional Materials—Stress and Strain—Wind Velocity Considerations.

By W. FORDHAM COOPER, A.M.I.E.E., A.M.I.Mech.E.

THE Electricity Commissioners revised the Overhead Lines Regulations in 1925 and again in 1928 (this must be a record for a Government Department), but there is a general complaint that the rules are still too severe.

The Commissioners would probably reply that winds of 50 miles an hour frequently occur, and ⅜ of an inch of ice does not seem a high estimate, to judge by the appearance of some telegraph wires last winter; further, a factor of safety of 2 is not excessive, Up to the present, power lines have not blown down, but on the data available it is uncertain how near we may be to the danger zone, and we must go carefully and reduce the loading a little at a time.

* * * * *

A factor of safety may be considered as an insurance against the incidence of abnormal stresses or the presence of defective material, and in this section the mechanical properties of the materials will be considered. To continue the analogy, a member of Lloyds may accept a risk which is often little more than a gamble, while the life assurance actuary computes exactly the risk he is taking, and can therefore quote a "cut price" with safety; the basis of his science is the "frequency curve."

If we wish to cut our premium (i.e., reduce our factor of safety) we also may study the question of "frequency" with advantage, and a start may be made with steel plate, the basic material for lattice towers. An analysis of the tensile tests on 250 specimens of steel plate manufactured to the same specification is represented by the "frequency" curves given in Fig. 2. The mathematics of the subject are

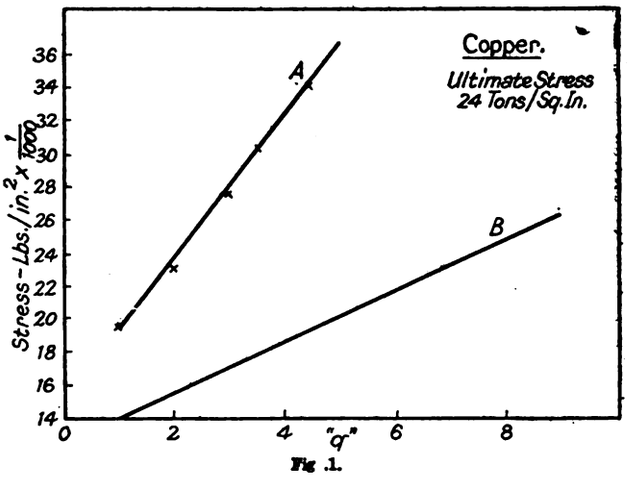

Fig .1.

specialised, though the practice is quite simple, and we can sufficiently explain the curves by stating that they are so constructed that if the total area of the curve represents a very large number of tests, the shaded area between A and B represents that proportion whose strength (or elastic limit) was between the values A and B.

Mathematically, this proportion, $P, = \int_A^B p dT$

If the scale of p is such that the total area of the curve is made unity, then P is a fraction and represents the probability of any one specimen having a strength between the values A and B, and the area of the curve between O and A is the probability of it having a value less than A. This, of course, presumes that the specimens taken are typical of all such material—which we have every reason to believe is true.

From time to time a really bad piece of material turns up, and this happens rather more frequently than the curves would suggest. This corresponds with the occasional very bad errors of observation which Lord Kelvin called avoidable errors—in this case they are definite mistakes in manufacture, and, given sufficient data, a frequency curve may be obtained for these also.

A steel ingot is, however, a very heterogeneous mass, even under the most careful manufacture, its properties varying from point to point in the most remarkable manner, and slag inclusions, etc., can never be completely eliminated.

Variations and inclusions of a macroscopic order which will not materially weaken a steel plate or even a tensile specimen may affect the whole cross section of one strand of a steel cable, and thus we may expect a greater variation of properties.

In the case of copper and aluminium, however, such macroscopic variations are not to be expected, especially when the materials are prepared electrolytically, and are in a comparatively pure state, whereas steel is essentially a very complex

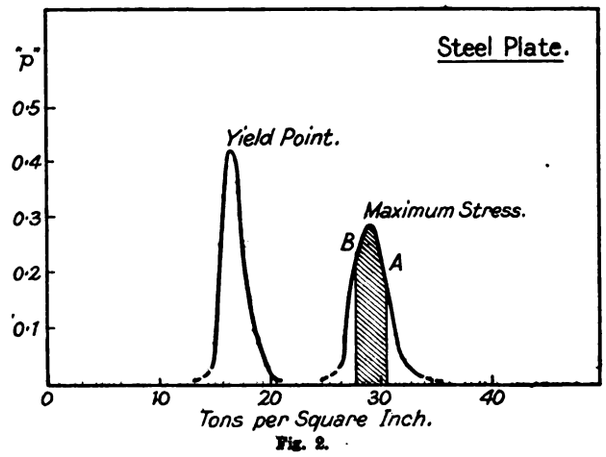

Fig. 2.

structure—in fact, it is the most complicated alloy known—and experience shows that the properties of copper and aluminium cables are more constant than are those of steel.

In any material the variation of stress with strain is highly complex, but we may, to simplify the argument, represent it approximately as follows:

$$\text{Strain} = \frac{f}{E} + \varphi_1(f) + \varphi_2(f, t)$$

f = stress
E = Young's modulus
t = time

The first term represents the elastic extension, and requires no further discussion. The second term represents the plastic extension. The third represents "creep."

These last two terms are not independent, but represent different aspects of plastic or viscous deformation. A material such as steel has a well-marked yield point below which appreciable plastic deformation does not occur at normal temperatures.

Above this yield point plastic deformation occurs, however,

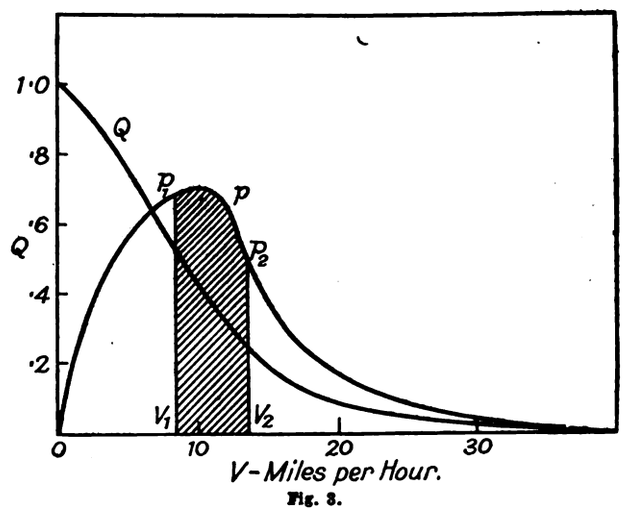

Fig. 3.

and tends to reach a limit depending chiefly on the maximum stress imposed. This deformation is represented by the second term.

In many materials, however, if the stress is maintained after this limit is reached, the strain will gradually increase with

Digitized by Google

time; this is represented by the third term. This applies to steel only at very high stress and at the high temperatures reached in furnaces and modern boilers.

In the case of aluminium, however, and to a lesser extent copper, there is no definite yield point, and with sensitive instruments plastic extension and creep can be detected at exceedingly low values of stress (although for practical purposes it is negligible).

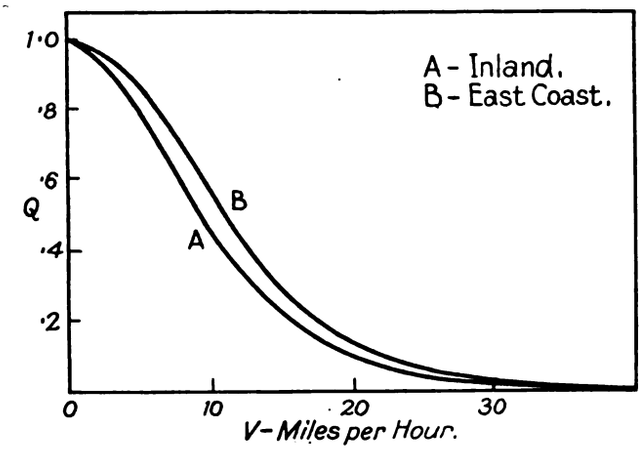

Fig. 4.

When the yield point is passed plastic extension will at first occur fairly uniformly along a wire before "necks" are formed and failure initiated, and up to this point the yield point is progressively raised by work-hardening. This elongation, though proportionally small compared with the "% on 10 inches" when a neck is drawn and failure occurs, is of immense importance, for it will tend to reduce the strain and save the structure at the expense of a small permanent "set."

(The above account is simplified further than can be justified on the facts of the case. For example, the joint effect of the second and third terms is that plastic deformation increases as the speed of application decreases, and this is observable even in the case of steel. The second term must therefore be considered as the limiting value for slowly applied loads when strain increments below a certain value are disregarded.)

In a rigid structure—for example, an overhead line support—the stress is proportional to the loading, thus:

(1) $f = kW$ where f = stress W = load;

or, should there be some initial stress before any load is applied:

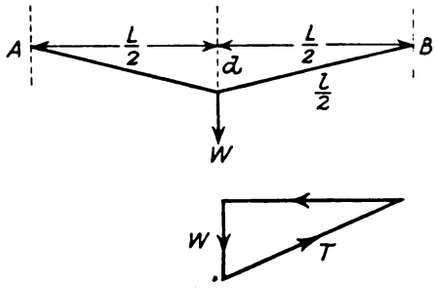
(2) $f = kW + C.$

But in thinking of factor of safety we are apt, subconsciously, to presume the first condition and assume the following relationship:

$$\text{Factor of safety} = \frac{\textit{Ultimate stress}}{\text{Design stress}} = \frac{\textit{Breaking load}}{\text{Maximum expected load.}}$$

And this is in general quite a useful conception (though we may at times design on the elastic limit or yield point rather than the ultimate stress).

When, however, we come to a suspended wire we have the antithesis of a rigid structure, and the simple relations given above are far from the truth; and as this point is of importance, a simple illustration may perhaps be excused. We will suppose a wire suspended between the points A and B to have its whole weight concentrated on the centre, thus:



L = span
l = length of wire
W = load
T = tension
d = sag

Then from the triangle of forces we see that:

(3) $$\frac{W}{T} = \frac{2d}{l} \qquad \text{or } T = \frac{Wl}{2d}$$

Further:

(4) $$d = \tfrac{1}{2}\sqrt{l^2 - L^2}$$

Should the load be increased so that T increases by an amount ΔT, the wire will stretch by an amount:

(5) $$\Delta l = \frac{l}{E}\Delta T,$$

where E is Young's modulus; and the sag "d" will increase by an equivalent amount.

The conditions of a wire whose load is uniformly distributed along its length are similar, and from equations corresponding to (3), (4) and (5) we can deduce a final relation of the form:

(6) $$T^3 \pm K_1 T^2 - K_2 W_2 = 0.$$

K_2 depends only on the span and the elastic modulus, while K_1 depends also on the initial conditions of the tension and loading.

The weight, and therefore the stress, of an unloaded wire is proportional to the cross section, and the intensity of stress is thus independent of the size of wire. We may completely eliminate the question of cross section by transposing (6) to a form which applies to wires of all diameters and for all conditions of loading:

$$f^3 \pm k_1 f^2 - k_2 q = 0$$

where $q = \dfrac{\textit{Total load per foot, including weight of conductor}}{\text{Weight of conductor per ft.}}$

= loading factor and f = stress.

Two typical curves of f and q for the same material are given in Fig. 1.

That the wire will stretch when the loading increases and thus relieve itself of part of the stress is, of course, well known and allowed for in the treatment given in the standard textbooks on overhead lines; but an elementary theory has been set out above to demonstrate that *the stress is not proportional to the load and, further, varies differently according to the elastic properties of the material* (k_2) *and the initial conditions of sag, loading and stress* (k_1 *and* q).

It is seen at once (Fig. 1) that a large increase in loading (q) does not necessarily mean a great increase in stress, and, in fact, our conception of the significance of factor of safety needs adjustment so far as this point is concerned.

Recapitulation.

We may now more clearly define the position. We have found that:

(1) It appears that a comparatively small factor is necessary to guard against unsatisfactory material.

(2) In the case of a suspended wire the stress does not increase nearly so quickly as the loading due to the peculiarities of the catenary.

(3) Though the excess load, which can be carried without a permanent set will depend on the load corresponding to the yield

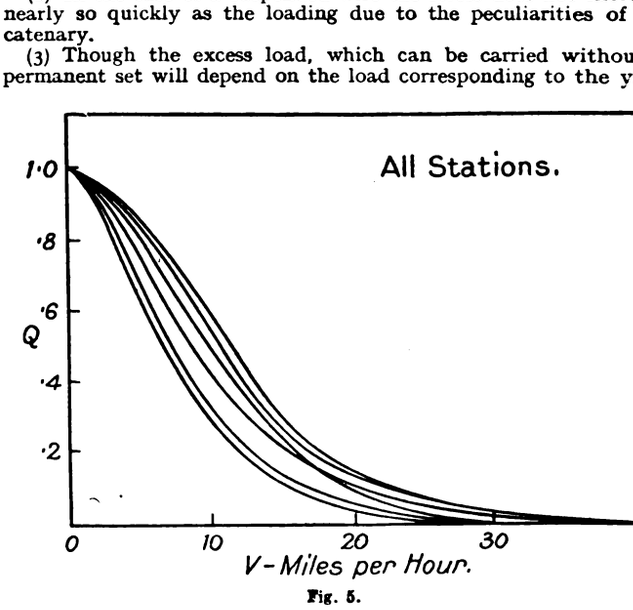


Fig. 5.

point, the actual safety will also depend on the amount of plastic deformation which can occur before the line becomes really dangerous. It may be asked whether we should be prepared to replace a badly stretched wire if a tornado does occur, or put in one that will withstand an earthquake.

Digitized by Google

When erecting a material such as copper it is usual to apply some fixed load in excess of the design load to " take out the stretch " or " kill " it before it is finally sagged ; this raises the yield point at the expense of future relief by plastic deformation. It is now necessary to examine the loading which may be expected.

We shall now attempt to find the correct value to be given to the loading factor q which may be defined as :

$$q = \frac{\textit{Total loading with wind and ice}}{\text{Weight of wire}} = \frac{\textit{Max. load}}{\text{Min. load}}$$

This will obviously vary with the size of the wire, since, taking the wind only, the pressure is proportional to the diameter, whereas the weight is proportional to the cross section. The ice load also—though rather indeterminate—will not increase so quickly as the weight, i.e. q must always decrease as the diameter d increases.

To illustrate this variation we must assume some definite loading, and Fig. 8 shows how q varies for solid copper wire

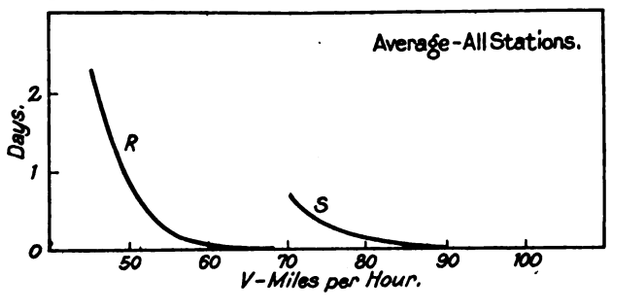

Fig. 6.

under the Commissioners' regulations for high pressure lines. The probability of such loading remains to be investigated.

A frequency curve can be plotted for the velocity of the winds in exacty the same manner as for the strength of steel plate. The following curves are based on the Annual Summaries of the Meteorological Office Reports for 1918–1926. The data set out in the tables is insufficient to give more than the general form of the curves, but the limits of the maximum velocity may be taken as fairly definite.

Fig. 3 gives the average distribution of the mean hourly velocity for all the meteorological stations (for one particular year). The curve of p has the same significance as in the case of steel plate—namely, the proportion of the hours during which the average velocity was between V_1 and V_2 miles per hour is represented by the shaded area V_1, V_2, p_2, p_1.

The value of Q at any point of the curve is the proportion of the year during which the average velocity exceeded the corresponding value of V :

$$\text{i.e. } Q_n = \int_{V_n}^{\infty} p\,dV$$

Fig. 5 gives Q for the years 1918 to 1926 for all stations, and Fig. 4 shows how the average of these curves varies for the different parts of England.

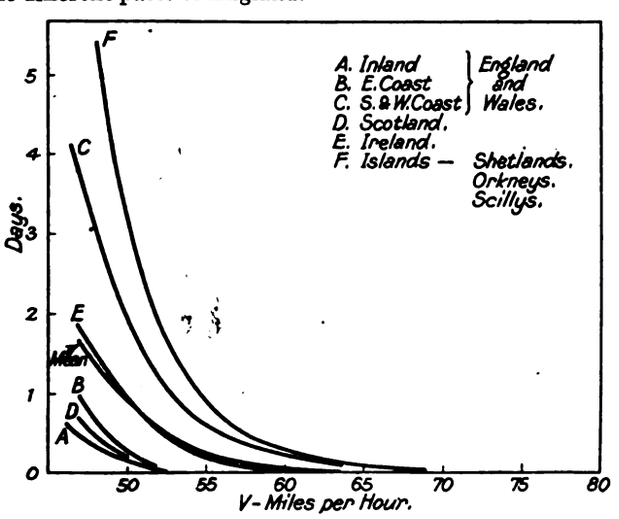

Fig. 7.

For our present purpose we are chiefly interested in the maximum velocity, and Fig. 6 shows this part of the curve in a slightly different form, i.e. R is the number of days per annum on which the highest value of the mean hourly velocity may be expected to exceed corresponding values of V, and in addition S gives the number of days on which the maximum gust may be expected to exceed the corresponding value of V. These are averages for all stations, but Fig. 7 shows how R varies when various districts are taken separately. The corresponding values for S (gusts) can be estimated by comparison with Fig. 6 above.

Generally speaking, the maximum gust in a year may be expected to be about 1·4 to 1·8 times the maximum hourly speed.

The results can be further summarised in the following table, which, however, is based on the average of all the records since the various stations were erected.

TABLE I.

District.	Max. recorded Gust Speed.	Average value of R_{47}.
Central and South England ..	80 miles per hr.	7·17 days
East Coast	80 ,, ,,	19·66 ,,
West and South Coast.. ..	100 ,, ,,	62·66 ,,
Scotland	90 ,, ,,	14·83 ,,
Ireland	112 ,, ,,	47 ,,
Islands : Orkneys, Shetlands, Scilly	105 ,, ,,	155 ,,

R_{47} is the average number of days per annum on which the maximum value of mean hourly speed exceeded 47 miles per hour.

The curves have shown the rapid way in which the probability decreases when high values are approached, and it can be seen that gusts above 100 miles per hour rarely occur even in the most exposed positions. Generally speaking, 80 miles per hour is the maximum.

It now remains to discuss the probability of the coincidence of snow, high winds and low temperatures. That they are all liable to occur about the same time of the year is obvious,

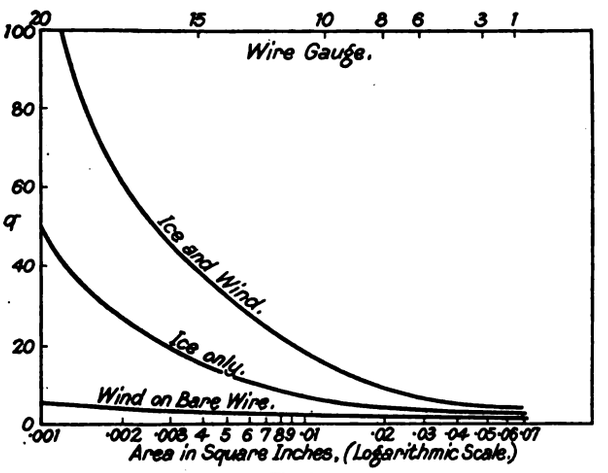

Fig. 8.

but it must be remembered that if the chance of any one of three independent events is 1 in 10, the chance of them occurring together is 1 in 1 000.

Apart from this, large flaky snow, which is liable to cling to an overhead line, only falls when the temperature is very near or just above freezing point. At lower temperatures it is a fine, dry powder. Generally speaking, it would only cling during a high wind if it had fallen at about 0 deg. C., thawed, and then refrozen solid. This very considerably reduces the probabilities.

On account of the complexity of the conditions, statistics are not directly procurable, but we should obviously expect curves similar to those obtained for the probability of high winds, and it is necessary to look for indirect evidence.

Post Office Procedure.

As pointed out in an earlier paragraph, the relation between loading and stress varies differently according to the initial stringing conditions, and Fig. 1 shows two curves for copper wire. A, on a 300 ft. span, adjusted to give a factor of safety of two for a loading factor $q=3$; B, on a span of 100 ft., to give a factor of safety of 4 when $q=1$.

The former is a fair representative of design under the Commissioners' regulations, the latter of the G.P.O. technical instructions which are based on a factor of safety on the free wire.

On the surface it would appear that the latter were the much safer construction, but in practice Post Office lines do blow

Digitized by Google

down, whereas a broken power line is as rare as the Greek calends.

If we look a little deeper we shall see the cause of the apparent anomaly. On the Commissioners' loading, a 0·1 sq. in. conductor has a loading factor of 2·7 and corresponds roughly with curve *A*, and, further, the value of *q* can be very greatly increased and still have a factor of safety.

On the other hand, the Post Office use conductors as small as No. 19 SWG, and we see that *q* may approach 100 with the same loading (Fig. 8). It would, of course, fail long before such values were reached.

We have here, therefore, a basis for statistical investigation, for it is at least probable that a survey of the casualties on telegraph lines and the stresses at which the wires were originally strung would give us a clue to the relation between probable loading and diameter of wire. We should, of course, have to exterpolate, and the values of *q* would obviously vary according to the districts (compare Fig. 7 and Table 1).

In this way telegraph lines would at last give some direct assistance to the power supply engineer.

Since these notes were originally drafted last July, Mr. Woodhouse's paper has been published by the Institution of Electrical Engineers, and this renders unnecessary any extensive comment on the factor of safety of supports.

The strength of a chain is the strength of the weakest link, and the Research Association tests clearly prove that the strength of a support is usually the strength of its foundations. The foundations are a very variable quantity, not amenable to exact calculation, and the strength is probably appreciably different for every pole in a line, so that without elaborate precautions it is a statistical certainty that in an overhead system there must be several weak spots. In practice, if a properly built power line does fail, it is the foundations that give—not the conductors or the poles. This so rarely happens that it has not been found necessary to take any such precautions with the foundations, which probably indicates that the loads for which lines are designed do not actually occur.

Conclusions.

The points we have deduced may now be set out as follows :

(1) The load-stress relations are such that it is incorrect to design on a factor of safety on stress, since the actual safety thus obtained will vary widely according to the initial conditions.

It would, therefore, be more scientific to design on a factor of safety on loading. That is to say, fix an upper limit of loading, at which the line should just fail, and design for the stress at this load to have some maximum value. This might very well be the yield point. As explained, the plastic strain beyond this point will make the actual load that can be carried with safety very much larger than the design figure.

In the case of galvanised steel, the yield point may be anything from 60% to 90% of the ultimate stress (calculated on unstrained area), according to the method of production and the degree of hardening. See Table 2. In the case of soft metals such as copper and aluminium there is no true yield point, but when they have been " killed " by stringing for a number of hours at about ¾ of the ultimate strength, this figure or, say, 90% of it, may be taken.

(2) The regulations stipulate a wind velocity of 50 miles per hour. Table 1 shows that in the south-east of England the hourly average exceeds 47 m.p.h. on about seven days in the year (corresponding to a maximum gust of approximately 65 m.p.h.). Other parts are more windy.

TABLE 2.

Strength of Single Steel Strands.

Area. ins.²	Yield Point. tons per sq. in.	Ultimate Stress. tons per sq. in.
0·005	24·1	28·3
0·013	22·6	28·4
0·021	30·9	35·3
0·005	33·2	55·9
0·013	20·6	27·6
0·020	36·9	39·3

Material supplied by different makers.

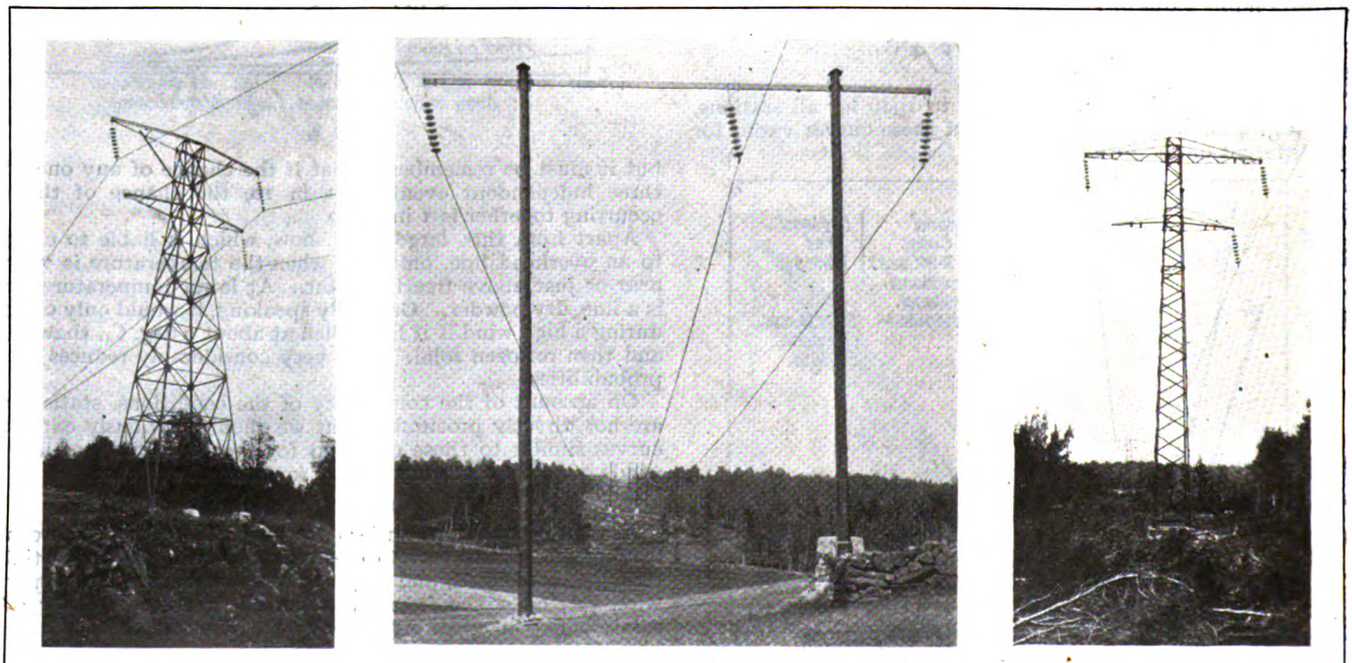
Fig. 8 shows, however, that the wind alone imposes no serious load, and it is the effect of wind on ice and snow, or even the dead weight of the snow alone, that really counts. This load is, however, so very indeterminate that only " field " experiments over a considerable number of years can be of any use—unless data can be obtained of wires that have actually broken.

Telegraph wires do break from time to time, and the factor of safety employed is, therefore, too low for power wires when danger to life is a factor. The writer does not remember any low tension wires designed for ½ in. ice load breaking, and the appropriate conditions apparently lie between these two.

(3) On the data presented there is no proof that a loading lower than the present low tension figure could be justified.

(4) The writer would hate to be responsible for a code or set of regulations, however carefully prepared, for should a typhoon find its way from the East and a few lives be lost—though it had never happened before and were unlikely to recur in the next two thousand years—yet the lay Press would hold him morally guilty of manslaughter.

(5) Not being responsible for the code, he hopes it will be modified.



132 000 *TRANSMISSION IN SWEDEN.*

THESE illustrations, furnished by the Royal Swedish Power Board, show 132 kV transmission lines between Trolhättan and Alingsas. On the left is an angle tower 55 ft. 9 in. high, carrying a normal 656 ft. span of 0·186 stranded copper. On the right is a straight line tower. The central picture shows a wood post line 43 ft. high, taking a 590 ft. span.

BIRD GUARDING ON OVERHEAD LINES.

Effects of Agricultural Crop Rotation on Bird Danger Areas—Guarding the Conductors—Treatment of Lines with Pin-type Insulators.

By E. KILBURN SCOTT, M.I.E.E.

IT is well known that overhead lines are subject to trouble, owing to the supply being tripped out by birds, such as rooks and crows, which cause short circuits through their bodies, and that even starlings, and other smaller birds, may also, at times, be troublesome.

As, owing to game laws, strict regulations about firearms, and a liking for animal life, we have in this country, relatively speaking, more wild birds than in many other countries, extra precautions have, therefore, to be taken. The following notes embody views of several engineers engaged in maintaining electricity supply on important transmission lines, and, also, some personal observations of the writer.

When a bird perches on a cross arm of channel or angle iron, or on a steel bracket, and pecks a live conductor, there is a trip-out, and current is shut off from important consumers for some time. One bird may be resting on a cross arm, or bracket, and its mate on the live conductor, and they make contact by stretching wings, or by one pecking at the other. There is also a possibility of a trip-out between phases, when several birds are fluttering round a pole and accidentally make contact. Accumulations of hay and straw on the insulators may also cause similar trouble when the material becomes thoroughly wetted.

Bird troubles synchronise with field operations of farmers, and are particularly bad where land is being prepared for seeding and planting. Whenever ploughing or manuring of land is in progress, or roots are being lifted, birds are much in evidence, because of the food turned over by ploughs and forks. Crows, in particular, are attracted by farmyard manure, and by low grade fertiliser collected from towns.

Crop rotation influences all agricultural operations, and the normal working of land adjacent to a long pole line route is such that the bird danger area is always shifting. To make a transmission line immune, the whole length of it must be completely protected. Local guarding is of no avail, except in the case where a line passes near a " bird sanctuary."

Various factors have to be taken into account when deciding on an efficient type of protection; the expenditure to attain the object, and the cost of maintenance.

The type of line most liable to bird trouble is that fitted with pin-type insulators, but lines fitted with suspension-type insulators are also affected in spite of their having larger insulating surfaces.

Guarding a line fitted with pin-type insulators may be effected, *first*, by guarding the iron cross arms, or the bracket insulator, and *secondly*, by guarding the insulators and the conductors themselves.

Guarding Cross Arms.

To guard a cross arm effectively is not an easy proposition, because it is difficult to decide just how much of it should be covered; also, the fixing of the guard material is difficult.

A guard made of earthenware has a clearance hole for the insulator pin, and is held in position by means of metal clips, or wires which contact with the earthed metal work. Unless these clips, or wires, are in turn protected or insulated, they permit a circuit between live wire and earth, via the claws of a bird when it happens to peck at the live conductor.

Owing to atmospheric conditions and galvanic action, the wires and clips are subject to deterioration, especially in the presence of fumes from chemical works or from burning coal pit refuse. If such deterioration occurs, the guard is easily dislodged by a high wind. Earthenware guards are liable to be broken, or dislodged, when a linesman makes use of his ladder during repair or overhaul work.

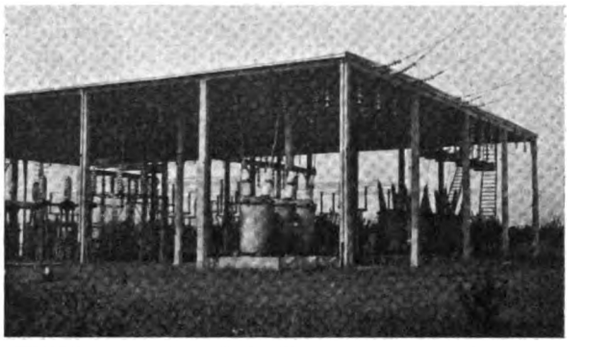
Cross-arm guards can be made of wood, or similar material, but they also have to be attached by means of screws or wires, and the same troubles occur as with earthenware. In addition, there is deterioration of the wood or fibre due to alternate wetting and drying, as the weather changes. Moreover, their use is limited to pressures below, say, 11 000 V.

It is obvious, that if guarding against birds can be done without the above-mentioned disadvantages, then there will be a considerable gain in efficiency of supply, and low cost of maintaining the line. The commercial and engineering staff who have the responsibility of keeping the transmission lines in order, will also have much less anxiety.

The guards should fit so as to prevent insects, and small birds, from getting inside, and, at the same time, the method of attachment should be such that they can be easily removed for inspection.

The Ideal Method.

In the writer's opinion the ideal method of guarding is to take care of that portion of the line which really causes the trouble, namely, the live conductors.



THIS picture from Italy illustrates the use of concrete for the construction of a shelter roof for an outdoor sub-station on a 130 kV line.

The conditions to be met by a guard on the conductors are :—(*a*) the guard should be easily fitted and kept in position; (*b*) it should be made of durable material of high insulating qualities; (*c*) it should not absorb moisture and should be able to withstand high atmospheric temperatures; and (*d*) it should not be unwieldy or unsightly.

A bird guard that meets these requirements called Pernax, made of pliable material, having a high and permanent insulation resistance, has successfully met all conditions in this country, and also of countries overseas, where there are tropical heat conditions.

The material is sufficiently pliable, for it is to be used as tape for insulating the tail ends of conductors, and for insulating staywires at vulnerable points, and it can also be made in the form of split tubing.

In its most usual form this bird guard is moulded to fit over the top of the pin insulator, and to project for a distance of about 1 ft. in each direction along the live conductors. The guard is dropped over the insulator, and the conductors, and then fixed in position by threading a lace through eyelets punched in the material, the lacing cord being covered with Pernax insulation.

Experience has shown conclusively that a bird may perch anywhere on a metal cross-arm, or bracket, and peck at the guard without any untoward effect, whatever the voltage may be. It is difficult to conceive of any method of achieving a similar result short of completely insulating all the earthed metal work, and the cost of doing that would be prohibitive.

During strong winds hay and straw is sometimes blown on to the insulators from adjacent stacks, and when it becomes wet, from rain or fog, it forms a leakage path to the cross-arm or bracket, and may cause a " trip-out." Pernax guards prevent this trouble and permit an accumulation of straw and hay to be left until it is time for the periodical examination.

It sometimes happens that a small puncture or crack develops in the top of a porcelain insulator and, being unprotected, there may be a trip-out during a heavy fall of rain or sleet. If the insulator is, however, covered with one of these guards there is no breakdown, and the faulty insulator can be weeded out at the inspection.

The cost of applying these guards on the conductors is, naturally, much less than covering iron cross-arms with earthenware or other guards. The cost of equipping a new line with these guards, or fitting them to a line already in existence, is amply justified by immunity from trip-outs.

FURTHER VERTICAL SWITCHGEAR.

Dual Purpose Lowering Mechanism—Some Important Safety Provisions—Points in Design of Main Top Plate.

OWING to the great interest which is being evinced in new types of switchgear construction, we give below some particulars of types of vertical drop-down switchgear which have been manufactured for some time by Messrs. Erskine, Heap and Co., Ltd., who, it is interesting to note, took out a patent covering the vertical drop-down principle of isolation in the year 1910.

Originally they embodied this type of isolation for low tension and 3 300 V gear, but extended it some years ago to cover up to 12 000 V; the illustrations on this page show a 12 000 V unit rated to rupture 150 000 kVA, and having a current carrying capacity of 500 A, the switch taking 23 gallons of oil.

The question of space economy has already been dealt with in great detail in previous articles on the subject, and there does not appear to be any divergence of opinion as to the great saving in floor space which units embodying vertical isolation possess over draw-out metal clad and truck type equipments.

In the case of the unit illustrated, the depth from back to front is 2 ft. 7 in., with an additional 10 in. for the maximum projection of the handle—the overall width being 3 ft. 4 in.

The question of overall height, while of importance, is not as important as the width and depth, as, if the gear is installed in a sub-station, the building must at least be of a height sufficient to allow an attendant to enter; and it is not a particular advantage to kneel in order to operate a circuit breaker in comfort.

Raising and lowering gear is fitted as an integral part of the unit so that a separate carriage for the lowering of the circuit breaker is not required.

There appears to be quite a difference of opinion as to whether an oil circuit breaker should be lowered or not, but as lowering gear is necessary in order to lower an oil tank with its oil, the same raising and lowering gear can quite comfortably lower the complete oil breaker, so that with the gear under review, one set of lowering mechanism only is required for the dual purpose of lowering and isolating the main circuit breaker and for lowering the tank.

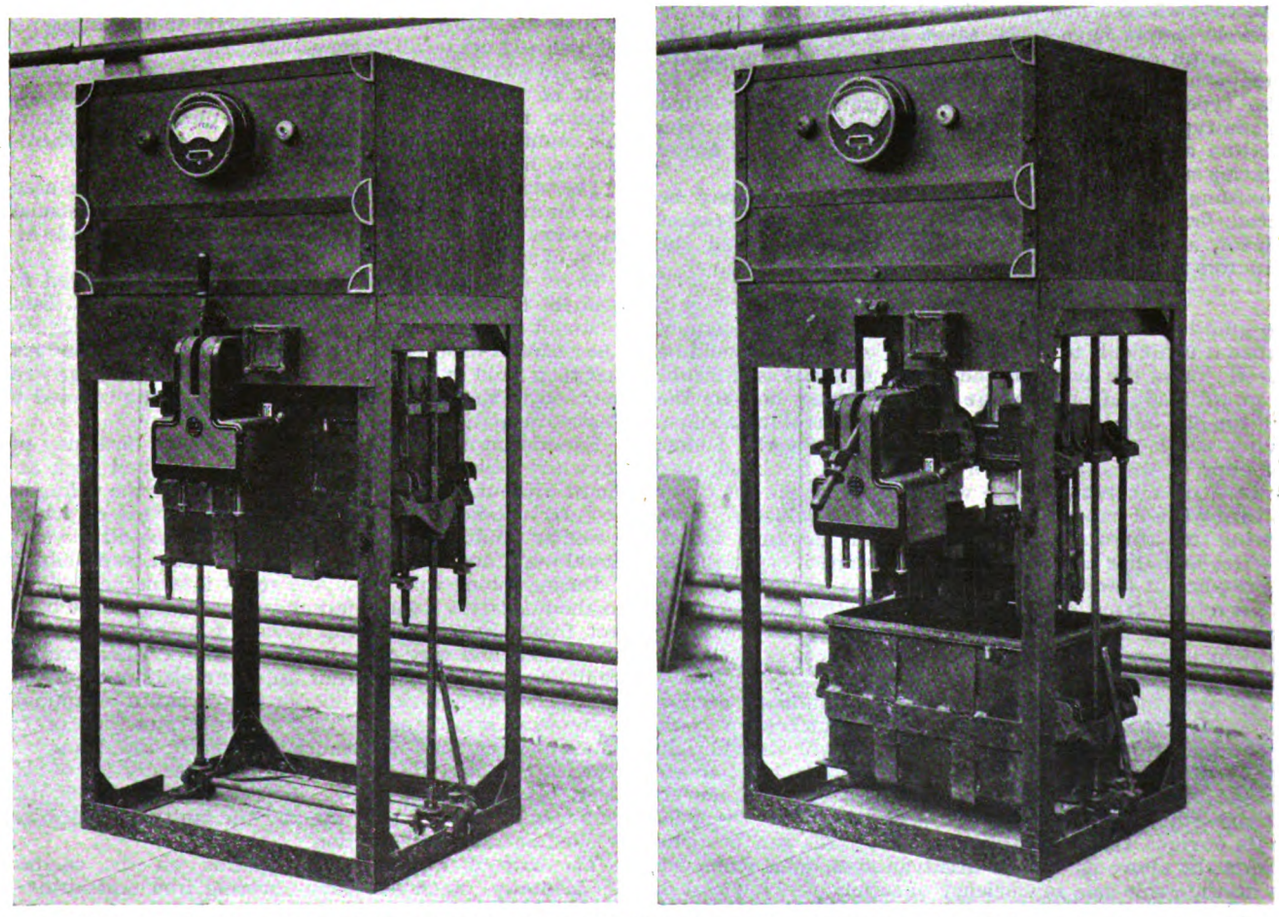
The lowering arrangements are such that the circuit breaker is safely isolated before there is any possibility of an attendant touching any "live" parts, both the isolating and tank lowering being operated by means of a single handle which functions in the following manner:—

The first movement of this handle causes the oil switch to open in the event of the oil switch having been left in the closed position when an attempt is made to isolate. A further movement of the handle causes the oil switch to be withdrawn bodily from the isolating contacts, and if the movement be then continued, the tank is lowered so as to expose the contacts etc. for inspection.

With the switch in this position, it can be operated so as to make quite sure that any renewals to sparking contacts, etc. which may have been required, are in perfect working order before the switch is again placed in circuit.

A further interlock is also introduced, so that in the event of the oil switch being left in the "on" position when an attempt is made to put the gear back again into circuit, this interlock prevents any parts from making contacts until the oil switch has been again placed in the "off" position.

These units have also the additional advantage that as the isolating contacts are not completely encased with insulation, it is possible for the operator, after the switch body has been lowered to the correct position for examination, to *see* that it is actually disconnected from "live" parts before beginning any examination or repairs, an additional safeguard being



A TYPE of vertical drop-down switchgear made by Messrs. Erskine, Heap & Co. It is seen on the left in the closed position, while the other picture shows how isolation and tank lowering operations are carried out with one handle.

Digitized by Google

supplied by the interposing of an insulated shutter between the "live" and the "dead" parts.

While on this point, it has been remarked that with the type of isolation which takes place inside tubing, and so completely shrouding the contacts, there would appear to be an element of doubt as to what might be happening inside the tubing, and the suggestion of the manufacturers is that it is "better to be safe than sorry."

The oil switch circuit breaker itself, being of recent design, is well within its rated kVA breaking capacity on the lines laid down in the latest B.E.S.A. Regulations, the units of similar size are interchangeable, and, being vermin proof, are particularly suitable for use in tropical countries.

The contacts are of the wedge and finger type of a special and substantial design, and are easily renewable. All the operating mechanism is contained below the main top plate of the circuit breaker, efficient vents being provided and arranged so that the gases can be taken clear of the unit in any desired direction.

In units of this type, it is essential, owing to the breaking capacity of the oil breaker, that special attention is given to make sure that the main top plate or containing case of the switch is of very robust design, this being a point which is frequently overlooked, with the result that while the tank of a circuit breaker may have been designed to withstand very considerable explosion forces, the main top plate is frequently of weak design.

In the design under review, these two points, namely that of the main top plate and tank have been given special consideration, so as to render them absolutely safe under short circuit conditions.

The operating lever embodies the Erskine Heap standard true free handle mechanism, and in addition is so arranged that a quick break is obtained quite independently of the speed at which the oil switch handle is operated, while the overload coils, being transformer operated, are fitted in the front of the unit, and are therefore quite accessible. The normal construction of these sub-station units does not provide for compound filled busbar chambers, but this filling can be arranged for, if required.

AN AMERICAN LETTER.

By FRANK C. WELLS (News Editor of "The Electrical World").

NEW YORK, *March 1st*, 1929.

THE agreement reached between the governments of the United States and Canada over the "rectification" by engineering methods of the Horseshoe Fall in the Niagara, which has been slowly but steadily receding because of the erosion of the rocks over which it pours, has brought general approval. The necessary cribbing structure in the river above this fall is to be built in co-operation by the Niagara Falls Power Co., which supplies electrical energy to Buffalo and the entire Niagara region in New York State, and the Hydro-Electric Power Commission of Ontario, whose lines gridiron that province. These power producers will share the cost, estimated at $2 000 000 or more, receiving in return the water temporarily diverted while the rectifying works are being constructed. This water will amount to 10 000 cu. ft. per sec. on each side of the international boundary—20 000 cu. ft. in all—and will permit the generation of 80 000 or more additional horsepower in the U.S.A., and of probably more than twice that quantity in Canada.

* * *

One thing the Senate, often so provokingly argumentative, did do in the short session now ending was to take up as unfinished business the Swing-Johnson or Boulder Dam Bill, already passed by the House of Representatives, and promptly pass it by 64 votes to 11. President Coolidge at once affixed his signature, and the Bill became an Act.

This measure apparently assures government construction of a huge dam in the Black Canyon portion of the Boulder Canyon, in the Colorado River, on the Arizona-Nevada border line. This dam is to have the triple purpose of controlling floods, providing irrigation and permitting the generation of power. It is over the last-named feature that the fight has been most bitter. It is likely to involve putting the federal government into the power business on a great scale, and to this the electrical industry has, in common with all conservative business interests, been unalterably opposed.

But such legislation in America has often a fourth hurdle to surmount besides House, Senate and Chief Magistrate. Arizona, dissatisfied with the share of water allotted to her, and a strenuous opponent of the measure, promptly contested its constitutionality, and that point now awaits the adjudication of the United States Supreme Court. There is necessary, too, the adherence of a sixth signatory state of the seven that contain the Colorado basin. California and Nevada of the lower basin states, Colorado, New Mexico and Wyoming of the upper basin, have approved, but Utah, an upper basin state, though favourably inclined, is still withholding her signature in an endeavour to bring Arizona, of the lower basin, round and make the agreement unanimous. What with seven-state, six-state, four-state and three-state complications it looks as if construction might be long deferred, though eminent engineers have pronounced the project a feasible one, and Congress has appropriated $165 000 000 for it.

* * *

If Boulder Dam were Castor, Muscle Shoals would be Pollux in the legislative firmament at Washington. The President's pocket veto of the act for government operation of the Wilson Dam and nitrogen fixation plants owned by the United States on the Tennessee led to a cessation of activity on the part of Senator Norris and his fellow-believers in government ownership when the short session opened. A Bill to turn the plants over on lease to the American Cyanamid Co. has been reported in the House, but it is likely to be left dead on the calendar with scores of others when the members adjourn.

* * *

The Federal Trade Commission's inquiry into the electric and gas utility companies hangs fire awaiting the outcome of a contest in the courts over the commission's power to compel the Electric Bond and Share Co. to divulge certain information and produce certain records which the company maintains are not pertinent to the investigation and should not be spread before competitors. The company, an investment and managing rather than technically a holding, organisation claims that, having no subsidiaries as it interprets the term, it is not engaged in inter-state commerce. The commission regards this contention as a subterfuge. Eminent counsel are now arguing the point.

Meanwhile Gifford Pinchot, famous as a fighter for the conservation of the nation's natural resources and formerly Governor of Pennsylvania, has issued a fat pamphlet aimed at the power monopoly which, he maintains, exists. He says that all save a few of the larger light and power companies of the country are under the control of one or another of six closely allied groups, and he accuses those who control these groups of ruthless exploitation and extortion. He even goes so far as to assign each one of a list of 4 362 light and power companies to its proper owner in the six-headed combination now threatening to enslave the people. Mr. Pinchot, however, would be more convincing were he less specific. Some of the classifications of his compilers are so wide of the mark that they are more likely to cause the monster he has conjured into existence a fit of laughter than a fit of indigestion.

* * *

Budgets of the operating companies for 1929 show another year promising large expenditures and much activity. It is to be noticed, however, that the sums appropriated are to a great extent for completing installations already begun. Not so many orders for huge prime movers or plans for long transmission lines at voltages running up to 220 000 are included as has been common in recent years. This perhaps indicates a slight relaxation in pace while the industry regains its breath and surveys its still unsaturated territory afresh.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Glass Insulators."

[TO THE EDITOR.]

SIR,—In reply to your correspondent, "P. M. W.," in your issue of February 22nd, I hope he has appreciated that the remarks in my article concerning sealing were intended for general conditions, such as would apply to varying classes of labour and conditions of service.

The use of cement has been disastrous when entrusted to unskilled labour, particularly when the correct time for setting has not been allowed.

Your correspondent does not say whether he is referring to glass or porcelain insulators, but I agree that where mechanical strength is the most important factor under consideration

Digitized by Google

cement may be utilised with advantage, provided that it is used with care and mixed with 20% silica sand and allowed to stand for at least three months. For general conditions, I have not found that the plaster of paris and glue combination has the serious objection suggested, and I know of a very large number of insulators which have been so fixed which are giving entire satisfaction.

In regard to the letter from Messrs. Taylor, Tunnicliff and Co., Ltd., in your issue of March 1st, I regret that the information contained therein does not add to my knowledge of the subject; rather does it emphasise the necessity and importance of glazing. If further proof is required I would suggest that they have insulators installed on a suitable three-phase line, utilising glazed porcelain, unglazed porcelain and glass for each phase. I am quite sure that the results will be interesting to most engineers engaged in the profession, and I shall be very happy to arrange for the free supply of the glass insulators, provided that the test results after service are published in the technical Press. Three sites should be chosen, one in an industrial area, another close to the open sea, and a third near, say, some cement works.

In regard to the remainder of the letter, since I have actually seen the conditions to which I refer, no remarks would convince me otherwise.

Referring to the temperature cycle test, it is well known that glass is capable of resisting all natural temperature and climatic conditions throughout the world, whether the changes are sudden or otherwise.

In considering a liquid immersion test we must not forget that glass absorbs less calories than porcelain under similar conditions, but under such suitable test glass will resist indefinitely—not only for five minutes—any tension approaching the dry flashover figure, whereas alternatively I agree that when porcelain is submitted to similar tests, the longer the test the more considerable becomes the deterioration.

The value of a polished or glazed surface is, therefore, of considerable importance, and, moreover, is somewhat surprisingly emphasised by one of my critics. In his article on the "Influence of Atmospheric Pollution on Performance of Line Insulators," in your issue of January 25th, Mr. Goodlet says:—

"It should be noted that the performance of an insulator in the fouled condition cannot be characterised solely on the basis of its sparkover voltage. Usually luminous discharges are present at very much lower voltages, and, with certain types of insulator, at the higher humidities these discharges assume the form of partial arcs between the sheds, developing considerable heat and noise, but without causing complete arc over. The action of such discharges, if prolonged, is very damaging to the surface and glaze of the insulator, and the useful life of the latter will be considerably reduced."—I am, etc.,

NORMAN E. NORTH.

March 13th.

Electrical Salesmanship.

[TO THE EDITOR.]

SIR,—I was interested in the suggestions made in the article on the above subject in your issue of March 8th. While it is not necessary to answer any criticisms of E.D.A. made, or implied, by the writer, it is perhaps desirable to put forward a few facts.

Almost every day this Association receives communications from those who have ideas on the direction in which propaganda should be carried out, and these are all carefully considered.

The policy of the Association is directed by a Council representative of the whole industry, and this Council and its committees give a very large amount of time and thought to the work of the Association; new ideas are being developed, as can be seen by anyone who receives the E.D.A. literature and programme of activities.

With regard to the particular suggestions which your correspondent made, I would make the comments set out below.

The Association has a strong Exhibition Advisory Sub-Committee who are assisting and advising promoters of exhibitions, and who consider on broad lines the policy of the Association as regards exhibitions.

The need for national selling of electricity has been realised by this Association, and this year's programme definitely visualises this, and puts before the industry a definite national selling programme which it is hoped that everyone in the industry will support.

The suggestion for a national Information Bureau has been made more than once, and I would like to say that the E.D.A. is already carrying out the functions of such a bureau. We receive inquiries from members of the industry in all parts of the country, and, indeed, from all parts of the world, on all kinds of matters connected with the commercial use of electricity.

During this winter we have had several thousands of inquiries from the general public in reply to the advertisements which have been inserted in the Press and letters which have been circulated.

Finally, I would say that the E.D.A. does endeavour to interest the Press in the use of electricity, and to influence them to accept articles on various aspects of the subject.

Very considerable success has been obtained in this work, and a survey of daily, weekly and monthly papers will show that there is a constantly increasing number of articles published on electrical matters, though from the nature of this work, the connection with E.D.A. is not necessarily apparent.

The support received by the E.D.A. during the year 1928 was greater than in any previous year in the history of the Association. My Council are very gratified by this, but still feel that although the work of the Association is having a considerable effect on public opinion, a great deal more could be done if further funds were available. They, therefore, appeal to every supply undertaking, every manufacturing firm, and every contracting firm to support this work, from which—whether they subscribe to it or not—they are receiving substantial benefits.—I am, etc.,

W. A. VIGNOLES,
Director and Secretary,
British Electrical Development Association, Inc.
London, W.C.2,
March 12th.

[TO THE EDITOR.]

SIR,—In view of the prominence given in your columns to salesmanship questions, your readers may be interested to hear of a rather smart effort for which a certain Leeds firm is responsible. Some of its customers received a few days ago a monthly statement dated February 28th. Typed across the statement was the following: "No account against you this month. We are sorry for this. Will you be ordering soon? Useful pad enclosed herewith."—I am, etc.,

Bradford, "SALESMAN."
March 16th.

Ex-Siemens Men.

[TO THE EDITOR.]

SIR,—The undersigned have had inquiries from time to time as to whether there is an organisation where ex-Siemens men can foregather, and it appears that such an organisation would meet the wishes of many.

We are, therefore, seeking the courtesy of your columns to invite those who have been connected with any of the Siemens concerns in the past—both at home and overseas—to communicate with one of the undersigned.

If there is sufficient response, it is proposed to form a small committee, to arrange, in the first instance, a reunion.—We are, etc.,

J. SNOW HUDDLESTON,
Union Cable Co., Ltd., Dagenham.

E. P. BARFIELD,
Wild-Barfield Electric Furnaces, Ltd.,
Elecfurn Works, North Road, Holloway, N.7.

Plate Type Turbo Rotors.

[TO THE EDITOR.]

SIR,—In your issue of March 8th, on page 298, you are good enough to make some appreciative references to myself. I feel compelled to correct, at any rate, one item inferentially credited to me; this is the more necessary as a similar paragraph has also appeared elsewhere.

The design of turbo generator rotor, in which the body portion is built up of plates without a through shaft, was suggested by B. A. Behrend, and the feasibility of the construction was demonstrated by him. This was clearly set out in the description of the construction which I was allowed to give to the Institution of Electrical Engineers in 1915 (see I.E.E. Journal, Vol. 54, page 67).—I am, etc.,

A. B. FIELD.

BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION.

Annual Dinner and Meeting—Lord Birkenhead Indicates Prospects of the Electrical Industry—Recapturing the Personal Relationship.

THE annual dinner of the British Electrical Development Association was held at the Piccadilly Hotel, London, on March 14th, Sir John M. Gatti (President) in the chair.

LORD BIRKENHEAD proposed the toast of the "British Electrical Development Association." After commenting upon the fact that he was a newcomer to the electrical industry, he referred to the early association of Sir John Gatti's father with the introduction of electricity into London. Continuing, he said he understood that the objects of the Association were very simple: there was no profit making-desire, but simply the belief that the extension of the uses of electricity was to the benefit of the nation as a whole. It was altogether admirable that there should exist an organisation whose sole purpose was to make known the possibilities which lay in front of the development of electrical energy in this country, and it was essential that such an organisation, if it were to be effective and successful, should be one that was not founded upon a commercial principle.

He desired to avoid controversial topics that evening, and did not wish to involve himself in a discussion as to whether it would be an advantage to the trade in this country, and to the particular trade in which they were all interested, if we were to say to the whole world "Keep your money away, we do not want it; we will continue to pay not only our own war debts but the war debts of our allies; we will maintain the gold standard, but at least let us protect ourselves by saying that you shall not invest a penny of foreign money in this country." He wished that some historical economist would examine the question of how much British capital had been invested in foreign countries since the Napoleonic wars, and with what results, and he also wished that some contemporary economist would tell us at this moment how much British capital was invested abroad without any differentiation between the British and the foreign investor, and with what result. These were problems which had assumed great prominence in recent days.

No organisation was, he thought, more variously supported than the British Electrical Development Association. Anybody who was interested in the electrical industry was eligible for membership of the Association, and that made it necessary to ask how great was the importance of the industry which they all represented. What were the developments likely to be, and what would be the effect of those developments on the future life and prosperity of the people of these islands, if we had the wit, or prescience, to understand them and to make our own individual contribution to this development.

He supposed that 40 years ago the gas companies could have purchased the whole of the electrical industry of this country for a sum which, measured in relation to their capital, would have been negligible. Looking at the development that had taken place since that date it was unquestionably true to say that if we took the domestic uses of electricity, hardly one house in six, even within the areas which were closely contiguous to the great sources of supply, was to-day using electricity for lighting. Was it to be supposed that these people would be satisfied for ten years to be denied access to the enormous convenience, the greater cleanliness, and the greater hygienic qualities of electric light? It was absolutely inconceivable that there would not be a development in domestic consumption, which at the present moment was incalculable, even to the most imaginative among them. That development must come; it must come swiftly, and it must come in our time. It was the duty of all engaged in the industry to concentrate, in the first place, upon the production of electric power, and in the second place upon its distribution as cheaply as the existing economic conditions made possible.

When we considered those great continents removed from us by 4 000 miles of ocean, we were apt to be discouraged that we had not the great water forces which were at their disposal for electrical purposes. On the other hand, we could console ourselves with the fact that the very compactness of the areas with which we had to deal provided conditions which were not inferior to those in the other countries. He was certain that the economic difficulties of this country in the next ten years would be profoundly influenced, and might possibly ultimately be determined by our development of electric power.

Incalculable Forces.

The Electricity Bill introduced by the Government was a bold and courageous attempt to enlist powerful forces upon the side of this new movement. The Central Electricity Board and the Electricity Commissioners were doing their best, and he saw many signs that they were successfully devoting themselves to the task of making electrical power the most vital element in the development of trade and movement in this country. We had at hand incalculable forces, the strength, facilities, and utmost resources of which were not yet completely realised. It was the work of the Association to make them known by propaganda, by illustration, and by instruction.

SIR JOHN GATTI, replying to the toast, said that Lord Birkenhead's survey of the position of the electrical industry represented not the fanciful dreams of people who had long struggled in the industry, but the outlook of a man who came to it with a unique experience of men and matters. Having explored all the avenues that were open to him, and all the claims that were made, Lord Birkenhead was able to say that the electrical industry was one with which he would be glad to be identified, and, indeed, he was now identified with it in a material and potent manner.

Lord Birkenhead had pointed out the relative positions occupied by the gas and electrical industries, and, curiously

Some of the members and guests of the British Electrical Development Association at the annual dinner, held at the Piccadilly Hotel, London, on March 14th.

Digitized by Google

enough, in a daily paper of the previous day he saw two paragraphs relating to gas. One was that the chairman of a very big gas concern had made the proud boast that gas was helping to ripen bananas. It was his sad duty to confess at once that the electrical industry had no bananas to ripen, but it did claim to have made possible the preservation of hundreds and thousands of tons of food. The other paragraph stated that the progress of a particular gas company was equal to that of any other gas company in the country, and showed an increase of 1 per cent. The electrical industry, however, preferred to put at least one o on to such a figure before it felt there was any ground for self-congratulation.

An appeal had been made to all those interested in the electrical industry to continue and to strengthen the movement of co-operation amongst all branches and sections, municipal or company, manufacturers or distributors. It was an appeal to co-operate to make known to the general public the advantages of the commodity which they had to sell. He hoped that advice would be taken to heart, remembering the results that had already been achieved, and remembering that in an Association such as the E.D.A., when a certain stage had been reached—and he claimed that such a stage had been reached—every additional effort told four-fold and ten-fold.

Mr. J. W. BEAUCHAMP, who was greeted with prolonged applause, proposed "Our Guests," and coupling with the toast the name of Sir Herbert E. Morgan, asked all those present when they got back to their respective spheres of influence to tell the people whom they met that the Association stood for something worth while. It carried on work where the Electricity Commissioners and the Central Electricity Board were, perhaps by the nature of things, compelled to leave off. It tried to educate the whole mass of the people in the best uses of electricity for their own advantage in order to get the most value from it, and it tried to do one more thing, perhaps the most important, namely, slowly to build up in the minds of every section of the public a sort of personality in electricity.

In recent years many businesses and organisations had become so big that the element of personality had to a large extent left them. We spoke in an airy way of public service, but he was afraid most of them rather missed the old relationship between buyer and seller. In the modern large organisations, which included electricity supply, the chief must necessarily be very remote from his consumers, and therefore it was necessary to find some new method of giving the consumer a feeling of personal interest in this great service.

SIR HERBERT E. MORGAN, in his reply, urged the necessity for keeping charges for electricity down to the lowest possible figure and suggested that this would be one of the greatest boons that could be conferred, not only upon the users, but also upon the electrical industry itself.

Electricity had followed the candle, the oil-lamp, and gas, but there was no reason to heat a room with an imitation coal fire, and there was no reason to light a room with an imitation candle. If the industry would only go into these matters and get the ladies to help, and if only it would present electricity in the way in which it could best be presented, he believed a great step forward would be made so far as the public was concerned. He suggested that the right course to pursue was to estimate the possible consumption in each locality, treat that as an economical unit, and offer the public in that area current at a pre-determined price. Finally, Sir Herbert said he was exceedingly pleased to realise from Lord Birkenhead's speech that it was Britannia who would illuminate this Empire, and not the Statue of Liberty.

The Annual Meeting.

The ninth annual meeting was held at the Hotel Cecil on March 15th. The report of the Council for the year 1928 showed that the Association made steady progress throughout the year, greater support having been received from all sections of the industry than in any previous year in the history of the Association. A feature of the year's work had been the reorganisation of the E.D.A. Provincial Area Sub-Committees on a new basis, with a definite constitution and rules as to election of members, together with the appointment of area officers in four of the eight areas into which the country is divided.

The work of the Area Committees and officers has already had a considerable effect in increasing the interest of those connected with the electrical industry in the provinces, and has brought new supply members to the Association, while manufacturers and contractors have also been attracted by the work being done, and a number have become members of the Association.

A continued growth in membership is a satisfactory feature of the year's work. Twenty-seven additional supply undertakings were enrolled during the year, and an increased rate of subscription was adopted by twelve undertakings.

A considerable amount of investigation work has been carried out by the Industrial Heating Sub-Committee, with the assistance of panels formed in various parts of the country, to study industrial heating processes. Papers have been read, and industrial electric heating exhibitions have been held. The Sub-Committee is considering the production of a cinematograph film demonstrating electric heating processes.

At the invitation of the Electricity Commissioners, the Rural and Agricultural Electrification Sub-Committee prepared a preliminary report on "The method of propaganda and educational publicity best adapted for the advancement of Rural and Agricultural Electrical Development in Great Britain," and this was included in the official Report of the Electricity Commissioners' Conference on "Electricity Supply in Rural Areas." The Sub-Committee produced a film dealing with rural electrification on the farm and in village industries from a practical standpoint; the film, which is called "Country Currents," is in four reels, and is about 3 500 ft. in length.

An exhaustive inquiry into the suitability of British domestic electrical refrigerators was made by the Refrigeration Sub-Committee and a Report (E.D.A. No. 698) issued, showing that British plant of this kind is satisfactory in every way. The Sub-Committee is preparing further booklets on refrigeration for general circulation.

Campaign Activities.

The E.D.A. Circle Campaign, which commenced in October, 1927, terminated at the end of March in the year under review, and a report containing summaries of the activities undertaken was prepared and circulated to all electrical interests. The principal results disclosed in the report are that 122 demonstration houses, exhibitions, and special electrical demonstrations were organised, mainly through the Electric Circles, securing an attendance of approximately 1 200 000 persons, while it was estimated that one-and-a-quarter million pamphlets were circulated.

In September, 1928, an intensive Factory and Workshop Lighting Campaign, planned by the E.L.M.A. Lighting Service Bureau, was commenced. The principal features of the Campaign included: five successive direct mail letters and educational publications to over 100 000 factories and workshops; over 100 lecture-demonstrations to industrial consumers, factory owners and managers, and industrial associations, and editorial articles in a considerable number of trade journals, circulating amongst manufacturers. Some 2 400 inquiries for further information were dealt with, and it is quite obvious that the Campaign caused considerable interest in all parts of the country and brought about direct results and definite business. During the autumn of 1929 it is intended to circulate to a specially prepared list of factory owners a booklet containing photographs of new or improved installations, which have been provided as a result of the recommendations made in this Campaign, and expressions of opinion by users on the value of these modern installations.

Instead of a special campaign of short duration the Council, last autumn, decided to introduce a special continuous programme of E.D.A. activities, and for this purpose provided a sum for special propaganda. Each month a programme is issued to the industry, giving particulars of what the Association is doing, and setting out examples of the national Press advertising that is being carried out; illustrations of blocks for local newspaper advertising that can be purchased from the Association are shown, together with particulars of posters, advertising blocks, lantern slides, and literature that can be provided by the Association in connection with the month's subject. The lectures suitable for the month's activity are also indicated, and the Area Committees and Circles are asked to co-operate in the various activities by arranging local conferences, providing lectures, etc. Further, month by month, photographs and instructions are given in the supplementary programme, showing methods of window dressing suitable for displaying the goods dealt with during the month.

A window display background is supplied free of charge to all members of E.D.A. who care to apply for it, while a special set of cube fittings, etc., suitable for dressing the windows in a number of ways, is offered at a price of £2 15s. For this outlay it is possible for anyone, by following the instructions given month by month in the programme, to have throughout the year a bright and fresh window display related to the subject of the national advertising for each period.

A NEW METAL-CLAD SWITCH UNIT.

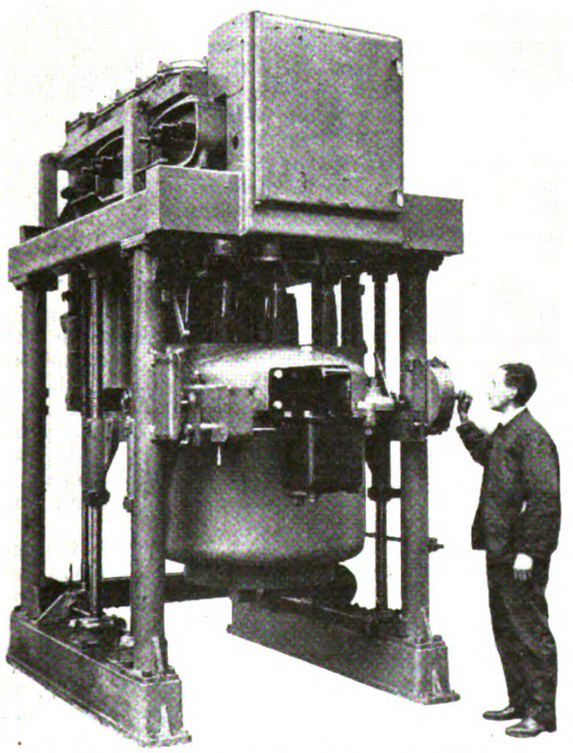
Heavy Rupturing Capacity in Small Space—Features in Oil Circuit Breaker Design—Interlock Arrangements.

ANOTHER interesting development in their metal-clad vertical switchgear has just been produced by Messrs. Ferguson Pailin, Ltd., the new equipment having been designed to meet the demand for a 750 000 kVA rupturing capacity unit in a small space, and, at the same time, afford safe accessibility to all parts. The current and voltage ranges are from 900 A at 33 000 V to 4 000 A at 11 000 V. On the duplicate busbar unit the breaker transfer method of busbar selection is incorporated, this arrangement being quicker and more positive than plug changing. With this scheme to effect bus transfer, the circuit breaker is lowered by the motor operating gear, moved horizontally along its supporting carriage, and then motor raised to the operating position on the other set of busbars.

The gear is built on the unit principle, which on duplicate busbar systems, enables additional units to be added without shutting down. Furthermore, it is jig assembled so that similar parts are strictly interchangeable.

The busbars are insulated with bakelite bushings and run in solid with compound, whilst the current and protective transformers may be solid compound-filled or immersed in a fluid-compound, which makes them accessible for changing for others of different ratio or capacity. The voltage transformer is oil immersed. The cable terminal chamber is normally arranged for solid compound filling, universal type glands being fitted. Special high pressure chambers can be provided for oil or fluid-compound filled cables. Expansion boxes are fitted on all compound filled chambers. The insulation consists of best quality bakelite throughout, condenser bushings being employed for the higher voltages.

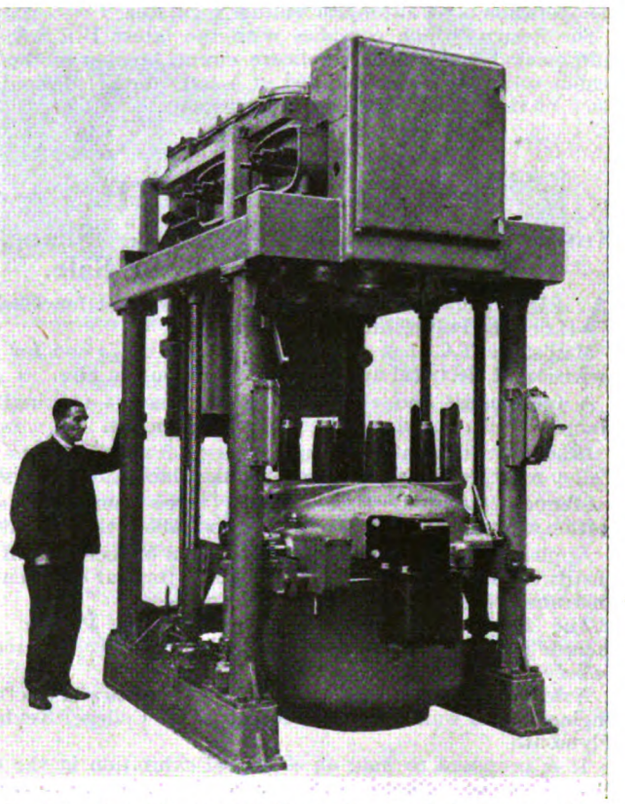
The movement of the circuit breaker for isolation, for inspection of contacts, for removal of tank or for complete



Front side view of the unit, showing the circuit breaker isolated.

removal of the breaker, is downwards. The circuit breaker is raised and lowered through motor operated worm gearing and substantial screws mounted in pairs on each side of the unit, and traversed by nuts to which the supporting carriage is bolted. The operations are controlled by means of an ironclad switch from the front of the unit. The socket members of the isolating features form an integral part of the circuit breaker bushings, and are of the self-aligning type. The problem of obtaining an effective disconnecting device for heavy currents, which permits easy insertion and withdrawal of the circuit breaker, yet ensures high contact pressure when in operation, has puzzled designers for many years. Messrs. Ferguson Pailin claim that the patented arrangement which they have evolved definitely solves this problem.

All operations are claimed to be mistake-proof, a full yet simple system of interlocks being incorporated. The makers state that it is impossible to make or break load on the plugs,



Front side view of the unit with the circuit breaker in the transfer position.

to close the breaker before the plugs are fully engaged, to remove the circuit breaker tank whilst in the operating position, or to replace the circuit breaker unless the tank is in position. Stops prevent over-travel, and efficient means are provided to ensure correct registration of the circuit breaker. The fixed plug members are automatically screened by metal safety covers on withdrawal of the circuit breaker, these covers being arranged for padlocking in the closed position.

An Outstanding Feature.

An outstanding feature of the unit is the oil circuit breaker. The design of the breaker, which is based on conclusions arrived at from the results of high power rupturing capacity tests, definitely prevents emission of flame, hot gases and oil. It is characterised by its massive construction, single cylindrical welded steel tank with dished bottom, high domed steel top plate ensuring an ample air cushion, internal link mechanism, high pressure oil gauge, and pebble filled gas vents, the baffling of which prevents oil throw. These vents are automatically connected to the exhaust chambers on the fixed portion of the unit when the breaker is inserted. The chambers are provided with unions, so that the exhaust gases may be led away as desired. The contact details are of special design to deal with the enormous currents developed when the circuit breaker ruptures a heavy fault. The operating gear is of the patented mechanically trip-free type, and is of an extremely simple design which eliminates complicated link gear. It can be arranged for solenoid or motor operation, and means are provided for emergency manual operation. A truck with roller bearing wheels is supplied with an initial installation to facilitate removal of the breaker or tank.

Both current and protective transformers are located on the feeder side of the circuit breaker, and on account of the heavy short circuit currents which might be developed, they are

Digitized by Google

of the single turn primary pattern. A patented self-compensating type of current transformer is provided where a low ratio is required. Additional secondary windings or double ratio transformers can be supplied. The voltage transformer is mounted complete, with its resistances and fuses, in an oil filled chamber, which is fitted with a breathing device. Independent isolation is provided to enable inspection or repairs to be carried out whilst the unit is in commission. The fixed contacts are arranged for screening with metal safety covers when the transformer is withdrawn.

Simple mechanical interlocks prevent insertion or withdrawal of the transformer unless it is completely enclosed. The chamber will accommodate three single phase transformers or a three-phase transformer with an additional winding for the operation of an automatic voltage regulator.

The design, which complies with the latest B.E.S.A. requirements, enables the duplicate circuit breaker method of busbar selection to be installed at a later date if desired, in place of the transfer breaker arrangement.

NEWS IN BRIEF.

Russia and American Radio — Shanghai Electricity Undertaking for Sale.

A FULL time lecturer in physics is required for Chelsea (London) Polytechnic.

Maidstone T.C. has applied for a loan of £3 000 for the provision of electrical apparatus to be let out on hire.

A mechanical and electrical draughtsman is required by Hammersmith (London) Electricity Department.

Bradford Corporation's annual visit of inspection to the Valley road generating station is to take place on April 10th.

Stepney (London) B.C. reqüires three temporary sub-station attendants during holiday period (about three months).

Applications are invited for the position of secretary of the Institute of Physics and editor of its " Journal of Scientific Instruments."

The forthcoming electrical exhibition at Preston will include wireless and trade electricity, a feature being a model bakery.

A demonstrator for laboratory work in physics and electrical engineering is wanted for the Royal Naval College, Keyham, Plymouth.

It is proposed to hold an electrical exhibition in the Oak Rooms at the Ealing Palladium, London, from April 6th to April 13th inclusive.

Since July 1st, 1928, the Russian Soviet Government has placed orders with the General Electric Co., of New York, for £120 000 worth of radio equipment.

On behalf of the Edison Electric Co. of Milan, Signor Motta has presented Signor Mussolini with £100 000 to institute scholarships for foreign travel and scientific research.

The Swansea Branch of the Association of Mining Electrical Engineers will hold a meeting to-morrow (Saturday), when Mr. C. L. James will read a paper entitled " Power Factor : Its Cause and Effect."

Burnley Electricity Department fixed 174 appliances during February, new consumers being connected numbering 99, prepayment meters fixed 66, and consumers connected on the rateable value system 32.

A system of road traffic control has been put into operation in certain parts of Manhattan, whereby the mechanical devices, operating the light signals in unison, are controlled from one room. All vehicles go east and west or north and south simultaneously.

In the course of a lecture on " Electricity in Agriculture, with special reference to Electro-Culture," at a meeting of the Western Centre of the I.E.E. at Bristol, last week, Mr. W. Phœnix said it had been established that the increase in crops under electricity was 20%.

The Ministry of Education for Northern Ireland invites applications for scholarships from persons employed in various industries, including electrical installation work. Form of application (No. H.75) and further particulars from the Secretary of the Ministry, Parliament Buildings, Belfast.

The North-Western Power Co., a subsidiary of the Winnipeg Electric Co., has placed the contract for a dam, spillways, sluices, concrete foundations and sub-structures for the power house for the 225 H.P. hydro-electric power development of 225 000 H.P. at Seven Sisters' Falls, on the Winnipeg River.

At the annual dinner of the Devon and Cornwall Section of the E.P.E.A. at Plymouth, on March 9th, Mr. E. G. Okell, city electrical engineer, Plymouth, remarked upon the valuable work done by the local sections, and the improvement which the Association had brought about in the working conditions of the industry.

In an address on " The Changing Conditions of the Twentieth Century " to the Manchester Luncheon Club on Monday, Sir Stephen Demetriadi said commercially we lived in a world of sellers ; the methods of yesterday would not do to-day. Acting upon theories which had become obsolete would, if long pursued, ultimately result in disaster.

At a recent meeting of the Chester-le-Street Rotary Club, Mr. Frank Hayton spoke on " Distribution of Electricity." He said the history of electrical legislation made a particularly depressing story, and it was a tribute to the vision of the British scientist and to the courage of the pioneer that, despite the handicaps of the politician, they had brought the electrical industry to the proud position it occupied to-day.

The annual dinner of the North Midlands Section of the I.E.E. took place at Leeds last week. Lt.-Col. K. Edgcumbe, referring to the general trend of trade, expressed the opinion that things were on the mend. Mr. W. B. Woodhouse said a modern phase in industry was the trend towards the larger commercial unit, while another good sign was the increasing importance attached to the better scientific training of those engaged in industry.

A report on telegraph and telephone progress in the Western Telephone District (South Western Engineering District) for 1928 states that the number of telephones increased by 3 414 to a total of 35 284, and 1 269 subscribers were served by 131 rural party lines. A main underground track is being laid between Plymouth and Torquay, a new repeater station has been opened at Taunton, and the work of providing a station at Tavistock is well advanced.

Sir John Snell, speaking at a meeting of the British Research Association for the Woollen and Worsted Industries at Bradford last week, said that confirmation had been obtained of a former estimate that there would be a reduction in the cost of electricity under the five new schemes of working for various parts of the country. Compared with the old regime of multiplicity of stations, the difference in cost ten or twelve years hence would be about £40 000 000.

It is understood that negotiations are in progress between Wireless Pictures, Ltd., and Prof. Denes van Mihaly, a Hungarian expert, for a public demonstration in England of apparatus invented by Prof. van Mihaly, and by means of which he claims that moving pictures can be transmitted and received by wireless. If the demonstration is successful, the British Broadcasting Corporation will be approached as to the possibility of establishing a regular service.

Electricity in Mines.

At a meeting of the Western District of the Association of Mining Electrical Engineers at Swansea on March 16th, notes prepared by Mr. W. J. Charlton, inspector of mines for the Swansea division, who was absent through ill-health, were read. Mr. Charlton said there had been a fairly steady increase during the last five years in the use of electricity in mines. The horse-power installed was 1 684 123. Electricity was used in 55·7% of the mines in South Wales, and the average horse-power of installed motors was higher than in any other region of the country.

Shanghai Municipality desires to transfer the municipal electricity works to private enterprise. Tenders have been invited, the highest received being that of the American and Foreign Power Co., of New York, which bid over £10 000 000. The British Trusts Association, London, offered approximately £6 380 000, and submitted a leasing plan. A leasing plan was also submitted by Lord Mexton's group, which includes Willans and Robinson, the Power and Traction Finance Co., and the English Electric Co. The Council will make a decision late in April.

The Commission of Inquiry, which, headed by Mr. L. Simon, recently visited the United States to investigate the methods of the American telegraph companies, has recommended that in the larger post offices in this country there should be glass-topped tables for the use of writers of telegrams, that attractive leaflets and folders suggesting the usefulness of the telegraph system should be available at post offices, etc., that messengers, summoned by telephone, should collect telegrams and that special forms and envelopes should be used for Christmas, Easter or birthday greetings, etc.

IN PARLIAMENT.

Galloway Water Power Bill Approved by House of Lords Committee.

DURING the proceedings regarding the Galloway Water Power Bill before a Select Committee of the House of Lords last week, Mr. Graham Robertson, K.C., for the promoters, said they had made some concessions with regard to the preservation of domestic water supplies, they had conceded Ayr County Council's requirement that they should make up diverted roads and maintain them for three years, and they had agreed that if the Doon fishings were damaged the proprietors should have monetary compensation.

Mr. J. Carmont, K.C., for Ayr burgh and Ayr County Council, said his clients might be content to take less than the 65 000 000 gallons of water a day if the promoters undertook to bear a part of the expense of the sewage disposal works which would have to be erected in consequence of the diminished flow.

Mr. A. B. Muirhead, consulting engineer, estimated that the production of 188 000 000 kWh a year under the scheme would displace about 445 miners through the loss of output of coal, and that loss would have to be borne by Ayrshire.

Mr. Abady, for the Mining Association of Great Britain, said the promoters had not made out a clear case that they could produce a cheap supply of electricity. Unless the promoters made a firm offer to supply electricity at a certain price the Central Electricity Board could not make a contract.

Sir John Snell said that, so far as he could gather, the engineering scheme was very well thought out, and that, having regard to the watershed and rainfall, it was getting the maximum power which could commercially be developed. He agreed that the scheme could not be a commercial success unless the current produced could be taken on the grid.

The Committee approved the preamble of the Bill.

Pontypridd Urban District Council Bill.

A Select Committee of the House of Commons considered this Bill last week. The Council sought powers to abandon its tramways and substitute trackless trolley cars.

Mr. F. G. Thomas, K.C., for the promoters, said if the trams were to be retained the Council was faced with an expenditure of about £30,000 in the relaying of tracks. The Council proposed to purchase ten trolley vehicles and ten petrol omnibuses.

Mr. J. E. Teasdel, general manager of the tramways, said the Council would not think of handing over to private enterprise the whole obligation to provide the transport necessary.

It was announced later that there was virtual agreement between the petitioners.

The Chairman said the Committee were not disposed to give Llantrisant power to exercise an absolute veto on any application for additional routes. The clauses providing for appeal to the Ministry of Transport could be put in the Bill.

London Passenger Traffic

A Select Committee of the House of Commons commenced, on Tuesday, consideration of the Bill promoted by the London Underground Railways Group and London County Council to authorise agreements for the co-ordination of London traffic.

Sir Lynden Macassey, K.C., for the underground companies, said since 1836 there had been a growing insistence by Royal Commissioners and others as to the necessity of co-ordinating the London passenger carrying system. The proposed scheme provided for the consolidation of the passenger transport services of London, with such public control as was required to protect the interests of the community in the matters of the level of fares, adequacy of services and development to the limit of available resources. It also provided for the setting up of a common fund and common management. No scheme of co-ordination of traffic was possible in London unless the Underground Co. and London County Council were parties to it. Those bodies represented between 84 and 85% of the whole of London's passenger traffic, excluding the main line railways.

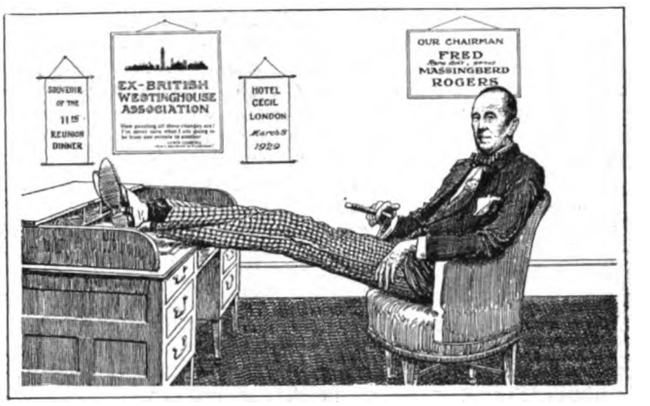
The agreement would be laid before Parliament, whereupon it became within the power of Parliament, if it thought fit, to declare the agreement null and void. He was prepared to have inserted in the measure a clause providing that if an agreement were reached between the Underground Co. and the L.C.C., any other local authority or traffic-owning body could demand to be admitted as parties to the agreement on a basis not less favourable than that of the existing agreement, having regard to dissimilarity in circumstauces or conditions.

PERSONAL.

MR. W. E. Bush has returned to duty after a three months' illness.

Mr. A. C. Fenwick, has been appointed general manager of Bury Corporation Tramways.

Dr. S. Z. de Ferranti, F.R.S., has been elected president of the E.D.A. for the ensuing year.



A cartoonist's impression of Mr. Massingberd Rogers, who presided at the 11th re-union dinner of the Ex-British Westinghouse Association.

Mr. T. D. Martin has been elected president of the Electrica Power Engineers' Association for 1929.

Major-General Sir Philip A. M. Nash has left London for Egypt, and expects to be away about a month.

Sir Robert Donald has been appointed chairman of "The Electrical Times," Ltd. in succession to Mr. Wm. May.

Mr. G. S. Haydon, resident engineer and manager at North Wilford power station, is severing his connection with that station on account of ill-health.

The name of Mr. A. J. Fuller, borough electrical engineer, Fulham, has been mentioned in connection with the I.M.E.A vice-presidency for the ensuing year.

Mr. D. N. Dunlop, director of the B.E.A.M.A., on Wednesday delivered a lecture, under the auspices of the Anthroposophical Society in Great Britain, on "The Supersensible Being of Man."

Obituary.

MR. FRANK WALKER METCALFE, on March 13th. He was manager of the machine section of the contract department of the British Thomson-Houston Co., Ltd., Rugby. Mr. Metcalfe was educated at the Blackburn Municipal Technical School, and joined Yates and Thom, Ltd., of Blackburn, as an apprentice. He joined the B.T-H. Company in the turbine drawing office in 1915, and was transferred to the contract department in 1919 as a member of the turbine section. He went to Japan on behalf of the company in 1926, and returned in 1927, rejoining the contract department as manager of the machine section. Mr. Metcalfe, who had recently been appointed to the Warwickshire Further Education Committee, was a member of the Rugby Further Education Committee since 1925, as one of the representatives of teachers, employers and workers, nominated by the Urban District Council. At the time of his death he was also serving on the General Purposes and Commercial Advisory Sub-Committees.

MR. ANTONY SIMON, on March 8th, at his residence in London after a short illness. Mr. Simon was born of French parents in Moscow, and was educated in that city. Following graduation from the Imperial University in Moscow he joined the Russian Dynamo Co. as a sales engineer. This company was at that time representing the old British Westinghouse Co., and in 1914 Mr Simon was transferred to the British Westinghouse Co.'s staff then maintained in Russia. Although at first acting purely as a technical translater, within a few months he demonstrated his outstanding ability as a sales engineer, and up to the time of the revolution he carried out many important negotiations for the British Westinghouse Co. In the disturbances following the revolution he lost practically all his possessions. After several adventurous months he came to England, where he rejoined the British Westinghouse Co.'s staff, first in Manchester and later in London. For many years past Mr. Simon has held the position of manager of continental sales for the Metropolitan-Vickers Electrical Co., and he was also a director of several subsidiary companies operating on the Continent. See page 361.

BOURNEMOUTH PAVILION.

Decorative Lighting Installation in New £250 000 Building.

BOURNEMOUTH'S new Pavilion, which was opened on Tuesday by the Duke of Gloucester, is of particular interest to our readers on account of the decorative lighting treatment and also because it is the building in which the forthcoming conference of the E.C.A. will be held.

The building, which cost £250 000, houses under one roof a concert hall seating 2 500 people, a dance hall to accommodate 800; a first-class restaurant to seat upwards of 500, besides a number of lounges, tea rooms, promenoirs, soda fountains and the like. Outside are a number of tea terraces, beneath which provision is made for an illuminated waterfall.

In the main entrance vestibule are imposing octagonal lanterns, glazed with amber-tinted glass panels. Around the walls several cast brass brackets are fixed with long shafts finished bright red, relieved with gilt, and surmounted by 16 in. alabaster dishes, lined with white opal glass reflectors. The staircases, left and right of the main hall, are illuminated by handsome octagonal lanterns, suspended from the centre of the glazed dome above. From four short bracket arms fixed in the body of the lantern are suspended four 6 in. Equiluxo globes, equipped with orange-sprayed lamps to colour tone the illumination of the lower staircase and floor below.

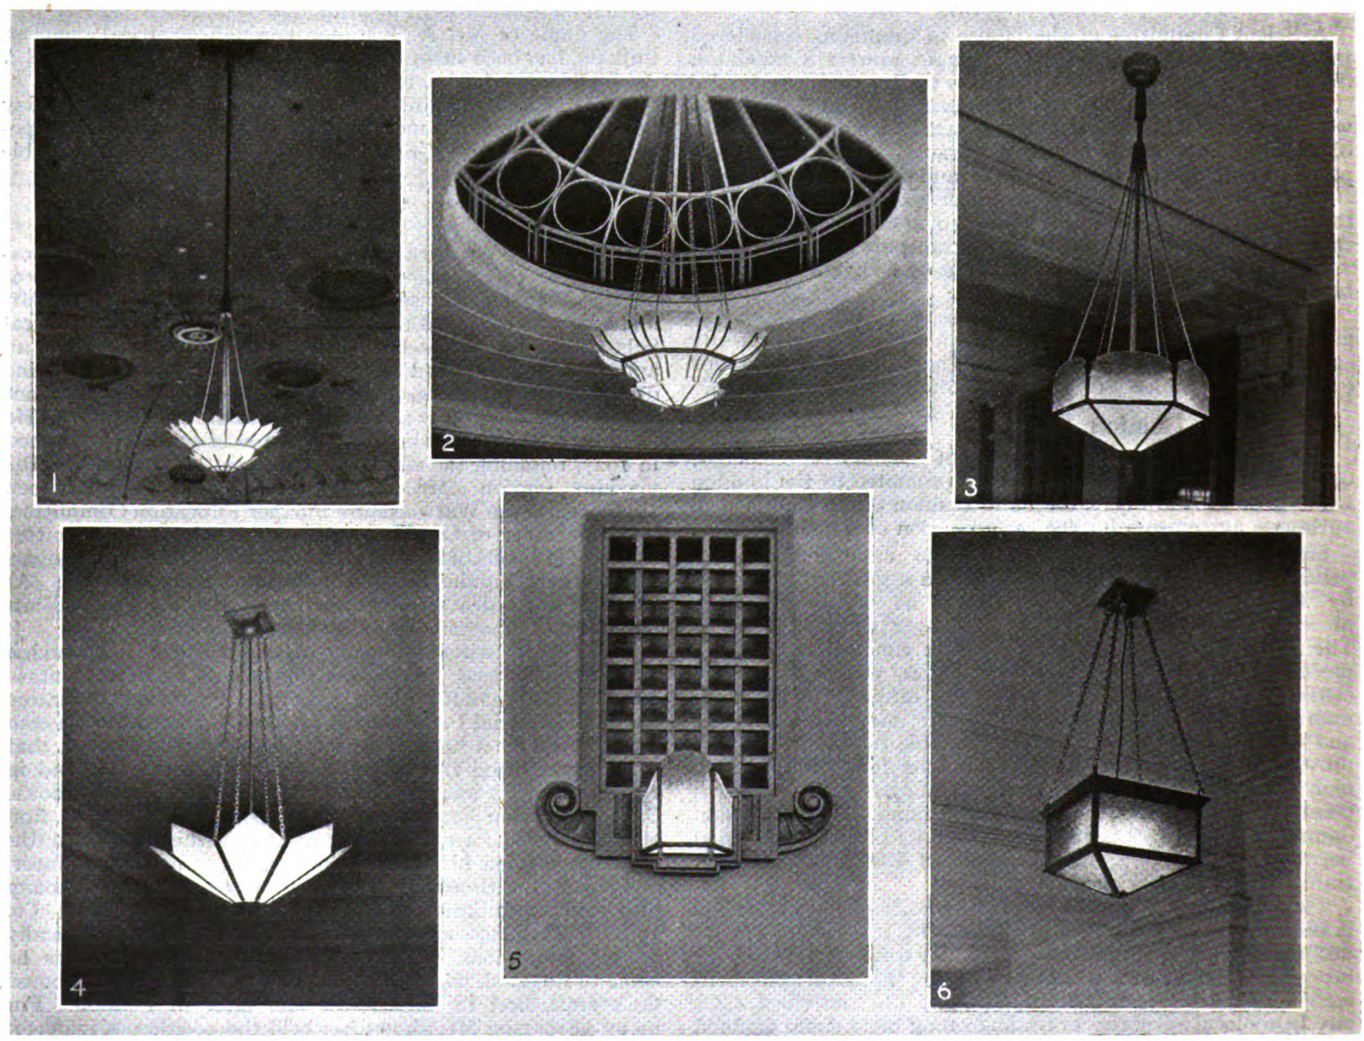
The main ceiling, promenoir and under balcony of the concert hall are illuminated with handsome glass fittings of simple and dignified design which are in perfect harmony with the decorative treatment of the auditorium. In the centre of the domed ceiling is a gilded sun burst, and from the centre of this is suspended a four-tier glass fitting of 8 ft. diameter, designed on plan to form a multiple-pointed star. The colour of the diamond raindrop glass panels is graded from white at the top to pale, medium and deep amber at the bottom. Four smaller two-tier fittings, each of 4 ft., dia. surround the coloured pendant, and under the balcony and around the promenoir single-tier fittings, smaller in proportion to their positions, complete the installation.

The main lighting feature in the large tea room and dance hall is a fine 6 ft. dia. pendant suspended from the centre of the dome. It is glazed with bent panels of diamond raindrop glass in pale and medium amber, finishing at the bottom with deep amber flat glass panels. The remainder of the fittings vary in diameter from 4 ft. to 2 ft., and are glazed with flat glass panels to match.

The Lucullus Room has a very effective lighting scheme, though it is of the simplest character. As the ceiling is low, it is planned with a shaped beam surround, relieved with a guilloche ornament. Small ceiling plates and galleries, carrying some forty-four 6 in. Superflux globes, half screened horizontally, with green and white opal covers, are fixed in the centre of the ornaments at about 2 ft. 6 in. spacing intervals. The repetition of these unpretentious units has a pleasing effect.

In the first class restaurant are installed pendants suspended from ceiling panels on silk covered rods and cord suspension. These fittings are hexagonal in shape, 4 ft. in diameter, glazed with pale and medium amber-tinted glass panels. Around the walls demi-coupé brackets to match are fixed in a number of shaped panels, giving a pleasing decorative effect to the wall surfaces which are panelled with mirror glass. The fittings in the second class restaurant are somewhat similar.

The entrance vestibules, staircases and lounges are equipped with handsome fittings of varying design, all worthy of special description, did space permit. The foregoing remarks, however, suffice to give an outline of the decorative lighting installation, the whole of which was manufactured and supplied by the General Electric Co., Ltd., and installed by Messrs, Aish and Co., of Bournemouth, under the instructions and supervision of the architects, Messrs. Home and Knight.



ILLUSTRATING the lighting fittings in the Bournemouth Pavilion, showing: (1) *one of the concert hall pendants;* (2) *the dance hall and central bowl pendant;* (3) *one of the units in the second class restaurant;* (4) *a promenoir light unit in the concert hall;* (5) *a wall fitting in the first class restaurant, and* (6) *a corridor unit in the dance hall.*

SPECIAL COMMITTEES.

Commissioners Appoint Committees to Consider Assisted Wiring, and Other Schemes.

THE Electricity Commissioners have appointed Mr. Ll. B. Atkinson, representing the C.M.A.; Mr. H. Bentham, representing the Provincial Electric Supply Association; Mr. S. E. Britton, representing the I.M.E.A.; Mr. D. N. Dunlop, representing the B.E.A.M.A.; Mr. J. T. H. Legge, representing the Incorporated Association of Electric Power Companies; Mr. H. Marryat, representing the E.C.A.; and Lieut.-Col. W. A. Vignoles, representing the E.D.A., to be a Committee, with Mr. E. W. Dickinson as secretary, to consider what steps could be taken to ensure that facilities for assisted wiring and for the hire and/or the hire-purchase of apparatus are made available, wherever needed, to prospective consumers of electricity in rural and other areas of supply, and to make proposals for a practical financial scheme for the purpose.

The Commissioners have also appointed Mr. H. Bentham, representing the Provincial Electric Supply Association; Mr. A. C. Cramb, representing the I.M.E.A.; Mr. J. T. H. Legge, representing the Incorporated Association of Electric Power Companies; Mr. F. W. Purse, representing the London and Home Counties Joint Electricity Authority; and Lieut.-Col. W. A. Vignoles, the Electrical Development Association, to be a Committee, with Mr. C. E. Allan as secretary, to consider the various kinds of charges and tariffs offered by authorised undertakers in connection with the supply of electricity for lighting, domestic, office and power purposes, and to make definite proposals whereby a greater measure of uniformity in respect of charges and tariffs could be brought about in the Electricity Supply Industry.

ELECTRICAL WOMEN.

Members of the Association at the Ideal Home Exhibition.

A LARGE party of members of the Electrical Association for Women, including many groups from the provinces, visited on March 13th the Ideal Home Exhibition, which concludes at Olympia, London, to-morrow (Saturday), as guests of the British Thomson-Houston Co., Ltd., and the Hotpoint Electric Appliance Co., Ltd.

Demonstrations were given of various electric lighting, heating, cooking, refrigeration, and labour-saving appliances, and it was evident that the ladies were as much interested in the theoretical and constructional details as in the many domestic advantages offered by the equipment. In the "Bedrooms through the Ages," the lighting effects in which were planned by B.T.-H. lighting engineers, the party saw numerous examples of electric light adapted to meet the requirements of almost any surroundings. The "Mazdalux" electric fountain in the centre of the ground floor aroused considerable enthusiasm.

After luncheon, which was served in the Pillar Hall Café, the visitors adjourned to "His Master's Voice" Hall of Music kindly lent for the occasion by the Gramophone Co. Mr. F. W. Leevers, on behalf of the British Thomson-Houston Co., and the Hotpoint Electric Appliance Co., gave an interesting talk on the steadily growing appreciation of the advantages of electricity in the home, referring specially to the value of coloured lighting, the introduction of electrical refrigeration, improvements in electric cookers, and washing machines, etc.

Miss Haslett, Director of the Association, thanked the hosts for their kindness in arranging the visit and Mrs. Beale, the newly-elected president of the Birmingham Branch, seconded.

Mr. Fenwick, of the Gramophone Co., gave an interesting talk on modern gramophone-radio apparatus,

The visitors, numbering over 300, included among the provincial groups of the Association, members of the recently-formed mid-Gloucestershire Branch.

On March 18th the members of the Manchester and Salford District Branch of the Association paid a visit to the Hyde Road Depot of the Manchester Tramway Department.

ERRATUM.

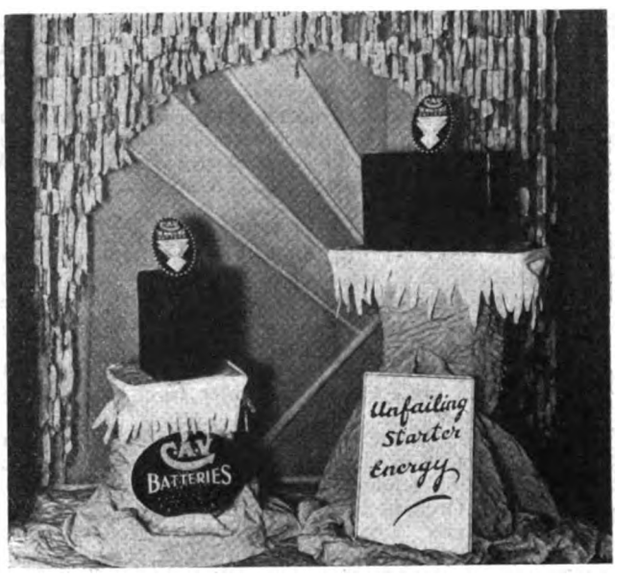
In the description of the new "A.C." microammeter of Ferranti, Ltd., which appeared in our issue of March 1st, pages 267 and 268, the range of the instrument was given as 750 mA. This should, of course, read 750 microamperes, the letter m having been printed instead of μ.

BUSINESS ITEMS.

MESSRS. BOUGHEY AND POWELL have opened new electrical showrooms at 18–24, Baldwin Street, Bristol.

Mr. WILLIAM TAYLOR, electrician, has opened premises at Millstone Yard, Peel Street, Barnsley.

The registered offices of the LORIVAL MANUFACTURING Co. (1921), LTD, have been removed to the company's Norwood Works, Southall, Middlesex.



The special car battery window display of C. A. Vandervell and Co., Ltd., which is available to the trade.

The telephone exchange and number of the CITY ELECTRICAL Co., Emerald Street, Theobalds Road, London, W.C., have been changed to Holborn 9722.

The PIGGOTT ELECTRICAL Co., LTD., and affiliated companies have removed to Salisbury Square House (Dorset Street entrance), Fleet Street, London, E.C.4.

An electrical exhibition, organised by the WESTERN ELECTRICITY SUPPLY Co., LTD., and held in the Town Hall, Bradford-on-Avon, on March 7th and 8th, was devoted chiefly to home lighting and small domestic appliances.

The ALTON BATTERY Co., LTD., Alton, Hants, has appointed Mr. Joseph Rea, of York Buildings, 32, Ann Street, Belfast, as agent for Alton stationary batteries, for Ulster and Donegal.

An order of more than usual interest has been received by the HART ACCUMULATOR Co., LTD., Marshgate Lane, Stratford, London, E.15, for a battery of 64 "JTPL" type cells, on behalf of the King of Hejaz.

MESSRS. EVANS AND WHEELER, electrical engineers, of 77, Market Street, and 22, Argyle Street, Birkenhead, have dissolved partnership. Mr. Stuart Evans will continue the business and Mr. Gordon Wheeler retires.

Of the exhibitors at the Printing Exhibition, which opens at Olympia, London, on April 11th, seventeen include examples of Brookhirst switchgear on their stands. BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester, will themselves be showing on Stand 2, Section V.

The buyer for a firm with a chain of shops throughout London and the provinces, is desirous of getting in touch with makers of electrical scrubbing appliances small enough to be used in a shop. The editor will be pleased to pass on the names of firms interested.

The MARCONIPHONE Co., LTD., 210-212, Tottenham Court Road, London, W.1, announces that, in addition to the lectures entitled "The Screen Grid Valve" and "Valves and Circuits for A.C. Mains," there is now a third on "Public Address Amplification," illustrated by approximately twenty slides.

A repeat order for "Kathanode" traction batteries has been received by the D.P. BATTERY Co., LTD., Bakewell, from Brisbane. The order was placed through the company's Australian agents, T. K. STEANES AND SON, and is for batteries for use on road-craft trucks. The British Post Office authorities are now carrying out experiments with seven 15 cwt. "Victor" vans in London, and one 30 cwt. and two 25 cwt. "Electromobile" vans in Leeds, these have also been fitted with "Kathanode" traction batteries.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

DAVENTRY GUARDIANS.—Electrical installation at Institution. Particulars from the Clerk.

WEST SUSSEX COUNTY MENTAL HOSPITAL, March 22nd.—Twelve months' supply of electric lighting sundries. Forms of tender, etc., from the Clerk and Steward, at the Hospital, Graylingwell, Chichester.

EAST HAM CORPORATION, March 23rd.—Supply of about 5 750 yards of 0·075 in., six-core, split-conductor, paper insulated, lead covered and double steel wire armoured 6 600 V (alternatively 11 000 V) cable, to B.E.S.A. specification.

Annual Stores Contracts.

HARROGATE CORPORATION, March 23rd.—Twelve months' supply of cables, joint boxes, joint box compound, service meters, service cut-outs, and transformers. Specifications, etc., from Mr. N. McLean, borough electrical engineer, 33, Swan Road, Harrogate.

HARROGATE CORPORATION, March 23rd.—One year's supply of meter boards, etc. Forms of tender from the Borough Electrical Engineer.

NEATH RURAL DISTRICT COUNCIL, March 23rd.—Supply of sundries in connection with Dulais Valley electric lighting scheme. Form of tender, etc., from Mr. D. M. Davies, Council Offices, Orchard Street, Neath.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, March 25th.—Electric lighting installation in seven blocks of tenement buildings. Specification, etc., from Mr. David J. Keep. town clerk, Town Hall, Cambridge Road, E.2 ; deposit £2 2s.

EDINBURGH CORPORATION, March 25th.—Supply of materials to the electricity department for 12 months, including cables, conduits, fuses and fuse boards, electrical material, electricity meters, meter boards, etc. Specification from the Engineer and Manager, Dewar Place Edinburgh.

FARNWORTH URBAN DISTRICT COUNCIL, March 25th.—Supply of l.t. cables. Specifications, etc., from Mr. A. J. Hutchinson, Electricity Dept., Albert Road, Farnworth, Lancs.

GLOUCESTER CORPORATION, March 25th.—Supply and erection of two 1 000 kW motor generators, for conversion of 11 000 V 50 cycle a.c. to 460/500 V d.c. Specification, etc., from the City Electrical Engineer, Commercial Road, Gloucester.

ILFORD CORPORATION, March 25th.—Supply of paper insulated cables. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Ley Street, Ilford.

KNOTTINGLEY URBAN DISTRICT COUNCIL, March 25th.—Electric light wiring of 48 proposed houses in Weeland Road and Womersley Road, Knottingley. Specifications, etc., from the Surveyor, Town Hall, Knottingley.

MANCHESTER CORPORATION, March 25th.—Heavy a.c. equipment, cables and lighting, at Hyde Road Tramway Car Works extensions. Specification, etc., from the City Architect, Town Hall, Manchester ; deposit £1 1s.

STIRLING CORPORATION, March 25th.—Electrical work in connection with the erection of sixteen houses at Burnside Street, Stirling. Specification (No. 8) from the Burgh Engineer ; deposit £1.

BETHNAL GREEN (LONDON) GUARDIANS, March 26th.—Installation of electric fans in parts of Institution, Waterloo Road, E.2, and of Hospital, Cambridge Road, E.2. Specifications, etc., from the Clerk, Administrative Offices, Bishop's Road, Bethnal Green, E.2. ; deposit £1.

ISLINGTON (LONDON) BOROUGH COUNCIL, March 26th.—Supply of new lead battery, for Edison refuse collecting vehicle. Further information from the Cleansing Department, Liverpool Road, N.1.

BLACKPOOL CORPORATION, March 27th.—Two electrically-driven sewage pumps. Specification, etc., from the Borough Engineer.

OLDHAM CORPORATION, March 27th.—Electric light installation in 200 houses on Limeside housing estate. Specifications from the Borough Engineer.

LEEDS CORPORATION, March 28th.—Supply and fixing of Ruston and Hornsby crude oil engine, and re-fixing, on a fresh site, of remainder of electric lighting plant and machinery driven thereby, at Gateforth Sanatorium. Specification from the Medical Officer of Health, 12, Market Buildings, Vicar Lane, Leeds.

BROOK MOTORS, LTD., March 29th.—Electric lighting work in connection with extensions to Empress Works, St. Thomas's Road, Huddersfield. Plans, etc., can be seen at the offices of Mr. J. Arnley, 55, New Street, Huddersfield.

GLASGOW CORPORATION, March 29th.—Supply of poles, bases and cables, for street lighting. Specifications from the Inspector of Lighting, 20, Trongate, Glasgow.

RHONDDA URBAN DISTRICT COUNCIL, March 30th.—Supply of house service, a.c., ordinary and prepayment meters, cable joint boxes, compound, cut-outs, etc., for one year. Specifications, etc., from the Electrical Engineer, Electricity Works Porth, Glam.

ROSSLYNLEE ASYLUM, March 30th.—Six months' supply of electrical fittings, etc. Forms of tender from Mr. C. L. Addison-Smith, 19, Heriot Row, Edinburgh.

MANCHESTER CORPORATION, April 3rd.—Supply and placing in position at Oldham Road " B " sub-station of one 8 000 kVA forced air-cooled transformer, 32 000/6 600 V, three-phase, 50-period. Specification (No. 232) and form of tender from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester ; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, April 5th.—Supply and erection of three single-phase, 4 000 kVA transformers, to form a 12 000 kVA three-phase bank, at the Authority's West Bromwich generating station. Specification, etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton ; deposit £2 2s.

GREAT WESTERN RAILWAY, April 9th.—Supply of electrical wires and cables (list 20), telegraph ironwork (list 21), and wire-iron and steel for telegraph work, etc. (list 28). Forms of tender can be obtained from the Stores Superintendent, Swindon.

CENTRAL ELECTRICITY BOARD, April 15th.—Supply and erection of 33 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-S.L.2) from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2. ; deposit £2 2s.

WEST RIDING EDUCATION COMMITTEE, April 17th.—Electric light installation at Edlinton New Middle and Elementary Schools and caretaker's house. Specifications, etc., until April 10th, from the Education Officer, County Hall, Wakefield.

CENTRAL ELECTRICITY BOARD, April 22nd.—Supply and erection of 33 000 V and lower voltage transformers. Specification (No. N.W.E.-S.T.2) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, April 29th.—Supply and erection of electricity meters, in connection with the Central Scotland Electricity Scheme. Specification (No. CS-SS 14) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

ANTWERP MUNICIPALITY, March 22nd.—Supply of electric cable and accessories. (Reference B.X. 5 124.)

INDIAN STORES DEPARTMENT, NEW DELHI, March 26th.—Supply of oil engine generator set (order No. N./9 439). (Reference B.X. 5 157.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 26th.—Switchboard cords. (Reference B.X. 5 067.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 26th.—Supply of telephones and dials (schedule C. 401). (Reference B.X. 5 023.)

SOCIETE NATIONALE DES CHEMINS DE FER VICINAUX, BRUSSELS, March 27th.—Supply of tramcars and trailers. (Reference A.X. 7 639.)

Digitized by Google

EGYPTIAN MINISTRY OF THE INTERIOR, March 27th.—Supply and installation of electric lighting system, for the town of Fashn. (Reference B.X. 5 037.)

PORT ELIZABETH MUNICIPALITY, March 28th.—Disconnecting boxes, oil and link switches, trifurcating boxes and electricity meters. (Reference B.X. 5 146.)

PORT ELIZABETH MUNICIPALITY, March 28th.—Supply of 33 000 V cable (specification No. 18). (Reference B.X. 5 147.)

PORT ELIZABETH MUNICIPALITY, March 28th.—Supply of transformers. (Reference B.X. 5 148.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, March 28th.—Supply of telephone switchboard boards. (Tender No. 148), (Reference B.X. 5 048.)

DUBLIN BOROUGH COMMISSIONERS, March 29th.—Installation of motors, starters, starting switches, etc., at City Abattoir. Specifications from Mr. F. McArdle, architect, 29, Rosemary Street, Belfast; deposit £3 3s.

KAILAN MINING ADMINISTRATION, March 30th.—Supply and erection at Shanghai of two 300 kW turbo-generators. (Reference B.X. 5 714.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 2nd.—Supply of jumper rings and terminal strips (schedule C 405). (Reference B.X. 5 066.)

INDIAN STORES DEPARTMENT, April 3rd.—Supply of paper insulated cables, for 660 V and 6 600 V, respectively, with joint boxes and joint compound (order No. N. 9 530). (Reference B.X. 5 164.)

INDIAN STORES DEPARTMENT, April 3rd.—Supply of 30 kW steam engine driven generator set (order No. N. 9 538). (Reference B.X. 5 167.)

ARGENTINE MINISTRY OF PUBLIC WORKS, April 4th.—Supply of Diesel electric Titan crane. (Reference A.X. 7 583.)

VICTORIAN RAILWAY COMMISSION, April 5th.—Supply of rectifiers and storage batteries, for power signalling purposes (contract No. 42 549). (Reference B.X. 5 166.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission line towers (specification 29/13.). (Reference A.X. 7 401.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Supply of 22 000 V transformers (specification No. 29/17). (Reference B.X. 5 101.)

DUBLIN BOROUGH COMMISSIONERS, April 9th.—Supply and erection of electrically driven pumping plant on site adjacent to service reservoir at Stillorgan, co. Dublin. Specification, etc., from the City Treasurer; deposit £1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 15th.—Conductor cords (No. P. and T., 151/1 319). (Reference B.X. 5 098.)

INDIAN STORES DEPARTMENT, April 16th.—Supply and erection of one 5-ton overhead electric three-motor gantry crane (order No. N. 9 536.) (Reference A.X. 7 652.)

INDIAN STORES DEPARTMENT, April 16th.—Supply and erection of one 5-ton electric telpher (mono rail), with track (order No. N. 9 537). Reference A.X. 7 653.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 17th.—Supply of copper earthplates (specification 133). (Reference A.X. 7 556.)

UMTALI MUNICIPALITY, April 18th.—Supply of line sundries, switchgear and transformers, in connection with extensions of electricity undertaking. (Reference B.X. 5 142.)

UMTALI MUNICIPALITY, April 18th.—Supply of 1 000 kW turbo-alternators, spray cooling plant, switchgear and crane (contract B). (Reference B.X. 5 145.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, April 25th.—Supply of three electrically-driven wheel lathes (tender No. 1 410). (Reference A.X. 7 621.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, May 15th.—Supply and erection at Government Printing Office, Cairo, of 120 kW d.c. Diesel electric generating set, with foundations, artesian well, electrically-driven water cooling pump, etc. Forms of tender, etc. (10s. 6d.), from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

VICTORIAN RAILWAY COMMISSION, May 15th.—Supply of one geared three phase electric winding engine (contract No. C.M. 778). (Reference A.X. 760.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, May 16th.—Supply and installation of electric signalling apparatus at Johannesburg. (Reference B.X. 5 165.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

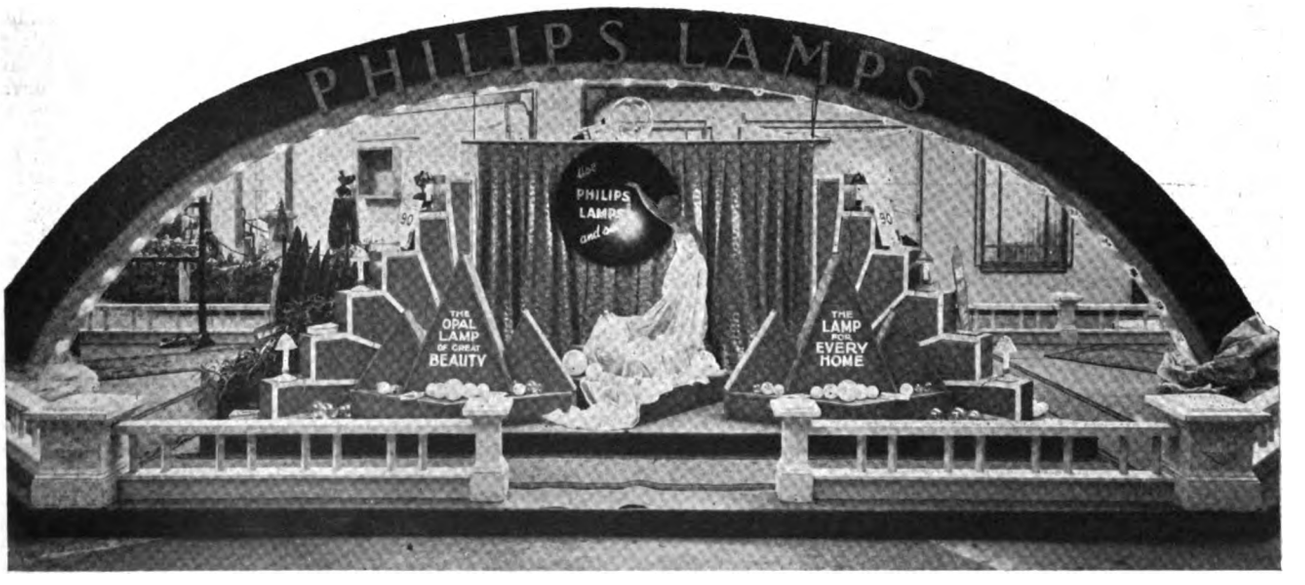
STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

CORNFORTH PARISH COUNCIL.—Cleveland and Durham County Electric Power Co., public electric lighting.

ELLAND URBAN DISTRICT COUNCIL.—H. C. Stringer, electrical and other works in 45 scullery houses.

SOUTHEND CORPORATION.—Jackson and Co., electric lighting installation at Intermediate School, £497.



THE stand of Philips Lamps, Ltd., at the Ideal Home Exhibition at Olympia, London. The exhibition, which contains many items of electrical interest, concludes to-morrow, Saturday.

Digitized by Google

HALIFAX CORPORATION.—H. Brennand, electricians' work in six lock-up shops in Ovenden Road, Halifax.

PORTSMOUTH CORPORATION.—W. J. Lenton, electric light installation at Milton Cemetery lodge, £46 5s. 9d.

EASTBOURNE CORPORATION.—Braine and Parris, wiring under assisted wiring scheme, 16s. 6d. per point.

CHELTENHAM CORPORATION.—Sharpe and Fisher, Ltd. supply of electric light fittings. (Recommended).

POPLAR (LONDON) BOROUGH COUNCIL.—Green Economiser Co., renewal of economiser plant, £1 086. (Recommended.)

BRIDLINGTON.—W. Carr, electricians' and plumbers' work in new residence on Sands Green estate, for Mrs. J. G. Gant.

LIVERPOOL CORPORATION.—C. E. Price, electric lighting installation at Old Swan washhouse, £59. (Recommended.)

Small House Lighting.

EASTBOURNE CORPORATION.—Braine and Parris, electric lighting installation in 250 small houses, 16s. 6d. per point.

SEAHAM HARBOUR URBAN DISTRICT COUNCIL.—Harrison Bros., wiring 40 houses on Carr House estate, £188 6s. 10d.

CLECKHEATON CO-OPERATIVE SOCIETY.—F. W. Birkett and Sons, electrical work for new business premises in Cheapside.

OLDBURY EDUCATION COMMITTEE.—H. Roberts, electrical installation at Bristnall Hall Lane Elementary School, £225.

BOLTON CORPORATION.—Forest City Electric Co., Ltd., installation of automatic traffic signals at Wheatsheaf corner.

CHELTENHAM EDUCATION COMMITTEE.—W. H. Tandy, electric light installation at the Dunalley Street School, £54.

CARLISLE CORPORATION.—A. G. Bullen and Co. and W. Batey and Sons, electric light installations in Council houses.

OFFICE PREMISES, ST. SWITHIN'S SQUARE, LINCOLN.—Kirk Wilson, Ltd., complete electric lighting and heating installation.

PORTADOWN URBAN DISTRICT COUNCIL.—Portadown Electric Co., Ltd., electric light installation at Central Market, £144.

WATFORD GUARDIANS.—Ellis and Ward, Ltd., installing electric light installation at casual, mental, and infirm wards, £568.

OLDHAM EDUCATION COMMITTEE.—J. P. Hall, Ltd., two rotary converters, for electricity laboratory of Technical College.

YORK EDUCATION COMMITTEE.—Corporation Electricity Committee, electric light installation at technical institute, £490 5s.

FARNBOROUGH URBAN DISTRICT COUNCIL.—A. E. G. Electric Co., Ltd., Hogan and Wardrop and C. C. Garrard, supply of l.t. cables.

EARBY URBAN DISTRICT COUNCIL.—A. Dodgson and Son, electric wiring of Council offices and adjoining house, £69 15s. 6d.

GUILDFORD CORPORATION.—Craigpark Cable Co., Ltd., supply of all-lead, covered, vulcanised indiarubber and flexible cord cables.

WEYMOUTH CORPORATION.—Worthington Simpson, Ltd., materials for new vertical spindle motor at Radipole pump house, £158.

GLASGOW CORPORATION.—Fullerton, Hodgart and Barclay, Ltd., supply of ten cable groove rings for subway power station, £418.

WORCESTER CORPORATION.—Abell and Smith re-wiring market hall and Butcher's market and providing electric fittings, £120.

ERITH U.D.C.—R. W. Downer, wiring baths for electric light, £53 10s., plus £3 5s. for wiring and connecting four special lamps.

AMPTHILL GUARDIANS.—Bedfordshire Electrical Installation Co., installation of electric heating apparatus in board-room and offices, £72.

METROPOLITAN ASYLUMS BOARD.—H. Lewis and Co., electric light installation at Southwark casual ward, £105. (Recommended.)

MAIDENHEAD CORPORATION.—Hackbridge Electric Construction Co., Ltd., two 100 kVA transformers, £122 each. (Recommended.)

GLASGOW CORPORATION.—Haddow and Co., Ltd., electrical installation at Shettleston and Tollcross baths, £970 15s. 2d. (Recommended.)

EALING CORPORATION.—R. E. Smart and Co., supply and erection of electrical sewage pumping machinery at Northern Sewage Works, £440.

BINGLEY URBAN DISTRICT COUNCIL.—E. Hey, electricians' work in connection with erection of three blocks of eight houses at Cottingley.

FIFE EDUCATION COMMITTEE.—Soave and Littlejohn, electricians' work in connection with additions to St. Marie's R.C. School, Kirkcaldy, £25.

NEWBURY CORPORATION.—Hathorn, Davey and Co., Ltd., 135 B.H.P. electric motor, with 10 in. horizontal pump, for drainage pumping plant, £899 5s.

GLASGOW CORPORATION.—A. and P. Steven, Ltd., provision of passenger lift at Glasgow Cross buildings, instead of recommended tender of Waygood-Otis, Ltd.

SUNDERLAND CORPORATION.—Forest City Electric Co., Ltd., and Barber and Colman, Ltd., installation of automatic traffic signals at various points, £320 (estimated).

RAMSGATE CORPORATION.—J. Carman, cable and electrical equipment, for use by the Sands and Entertainments Committee, £132 13s. 1d.; electric lamps, £74 12s. 2d.

GRAVESEND CORPORATION.—British Thomson-Houston Co., Ltd., supply of switchgear, £233 13s.; Bruce Peebles and Co., Ltd., supply of transformer, £136. (Both recommended.)

METROPOLITAN WATER BOARD.—W. T. Henley's Telegraph Works Co., Ltd., supply of 750 yards of h.d. bare copper wire and 500 yards of h.d. double braided copper wire, £90 9s. 1d., less 2½%.

SHOREDITCH (LONDON) BOROUGH COUNCIL.—Hewittic Electric Co., Ltd., supply of mercury arc rectifier automatic converting equipment, at Evelyn Street sub-station, £9 643. (Recommended.)

NORTHAMPTON CORPORATION.—Northampton Electric Light and Power Co., Ltd., supply of current for lighting two traffic control signal installations for 24 hours daily, £15 4s. 2d. per control per annum.

WESTMINSTER GUARDIANS.—Bellis and Morcom, Ltd., installation of generating plant at St. Stephen's Hospital, £1 347; General Electric Co., Ltd., alteration of existing switchboards, £171.

ESSEX COUNTY COUNCIL.—Christy Bros. and Co., Ltd., work in connection with electrical installation at new sanatorium, Black Notley, £1 879 1s.; E. C. Porter, supply of 10 H.P. electric motor, £55.

STAINES GUARDIANS.—Cooksey and Son, wiring, etc., in connection with lighting of portion of Infirmary, and also Girls' Home, £261; Staines and Egham Electricity Co., transformer, cable, etc., £67.

PLYMOUTH CORPORATION.—Chloride Electrical Storage Co., Ltd., supply of two batteries for electric vehicles, £212 5s. 6d. each; Harland Engineering Co., provision of feed pump at Prince Rock power station, £291 7s.

HULL CORPORATION.—Automatic Telephone Manufacturing Co., Ltd., table telephones and bell sets, £402 3s. 9d.; F. Smith and Co., bronze wire, £330 10s. 6d.; W. F. Dennis and Co., cable, £124 15s.; and inside wire, £96 8s. 3d. (All recommended.)

KETTERING URBAN DISTRICT COUNCIL.—Ferranti, Ltd., 50 kVA transformer, £51; Brush Electrical Engineering Co., Ltd., 250 kVA transformer, £170; Crompton Parkinson, Ltd., 350 kVA transformer, £185; Union Cable Co., Ltd., h.t. and l.t. cables, £1 194.

DURHAM COUNTY EDUCATION COMMITTEE.—Simm and Richardson, electric light installation at Usworth Colliery School, £289 10s.; and electric light installation at Seaham Harbour Council School, £167; Falconar, Cross and Co., Ltd., installation at Brandon Colliery School, £370.

BIRKENHEAD CORPORATION.—W. T. Glover and Co., Ltd., 2 000 yards, 0·15 sq. in. l.t. 4-core cable, £1 240; and 1 000 yards 0·0225 sq. in. l.t. 4-core cable, £194; Hackbridge Cable Co., Ltd., 1 000 yards 0·2 sq. in. l.t. 4-core cable, £774; and 4 000 yards 0·1 sq. in. l.t. 4-core cable, £1 940.

Lighting of Baths and Washhouses.

LIVERPOOL CORPORATION.—Lambton and Hobster, alterations to pendant lights at Queen's Drive, Lister Drive, Picton Road and Garston baths: R. Jones and Co., electric light installation at Old Swan washhouse, £49, and new heated frame at Bowring Park, £297. (All recommended.)

WESTMINSTER CITY COUNCIL.—Coleby and Co., electric light installation at Buckingham Palace Road baths, £105. (Recommended.) Also tendered:—Buchanan and Curwen, £119; Gaillard, Robinson and Co., £122; W. J. Furse and Co., Ltd., £144; Speedy and Eynon, £145; H. E. Keen and Co., Ltd., £159.

HULL CORPORATION.—A. Shaw and Sons, electric lighting installation at Francis Askew school extension, £999 18s.; Schall and Son, Ltd., X-ray apparatus, £617 6s. 8d.; and apparatus for light treatment and electrical therapy, £231 19s. 4d.; Spencer Heath and George, Ltd., apparatus for orthopædic treatment, at East Hull clinic, £34 10s. 3d.

WORK IN PROSPECT.

ANDOVER.—School (120 places), for Hants Education Committee. Particulars from the county architect, Mr. A. L. Roberts, The Castle, Winchester.

BEESTON.—Offices and factories for Boots, Ltd., Nottingham.

BOURNE.—Houses (32), for the Urban Council. Particulars from the contractor, Mr. T. A. Scotney.

CHESTERFIELD.—School, Boythorpe, for the Borough Education Committee. Particulars from the Education Architect.

DORCHESTER.—Houses (12), for the Rural Council. Particulars from the contractors, W. J. Cooper and Son, Bridport.

HATFIELD.—Houses (12), for the Rural Council. Particulars from the contractors, Shadbolt and Nash.

KINGSTON-ON-THAMES.—Cinema theatre, Bridge Approach, for Mr. H. E. Cohen.—Rebuilding Row Barge Inn for Hodgson's Kingston Brewery Co.

LEEDS.—Physics Department, for the Council of Leeds University. Particulars from the architects, Lanchester, Lucas and Lodge, 19, Bedford Square, London, W.C.

LEYTON.—Senior school (400 places), for the Borough Education Committee. Particulars from the architect, Mr. John H. Jacques, 61, West Ham Lane, Stratford, E.

NORTHAMPTON.—Extensions, bus garage, for the Town Council. Particulars from the borough engineer, Mr. Alfred Fidler.

ONGAR.—Housing scheme (44), for the Rural Council. Particulars from the Surveyor.

OXFORD.—Parish hall, to cost £3 500, for St. Michael's Parish. Particulars from the Incumbent.

SOUTHWICK (SUSSEX).—Housing scheme to cost £18 620, for the Urban Council. Particulars from the Surveyor.

STALYBRIDGE.—Extensions, West Hill and Central schools, to cost £14 000, for the Borough Education Committee. Particulars from the Clerk.

STOCKPORT.—Extensions, Stepping Hill Hospital, to cost £10 000, for the Board of Guardians. Particulars from the architects, Peirce and Son.

TORQUAY.—Hotel and shops, Victoria Parade, for A. Haarer and Son.—Extensions, Palm Court Hotel, Abbey Crescent, including 86 bedrooms, restaurant, etc., for Mr. Purkis.—School to cost £14 798, Barton, for the Borough Education Committee. Particulars from the contractor, Mr. H. Cruse.

INDIVIDUALIST LUNCHEON.

Important Pronouncement on Two and Three Party Political Systems.

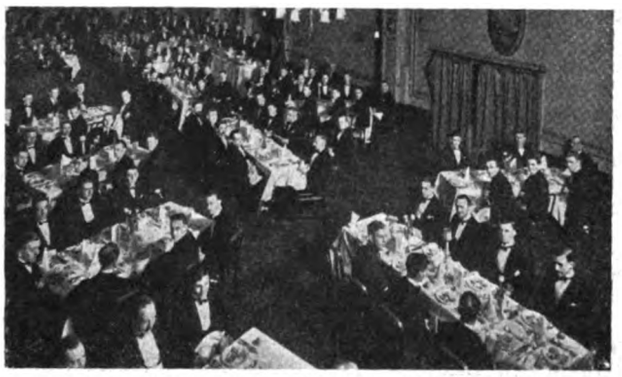
PRESIDING at the 23rd Individualist Bookshop luncheon at the Hotel Cecil, London, on Tuesday, Lord Hugh Cecil, M.P., said that he was an individualist because the individual was the unity of all moral and intellectual decision, and as such, he wanted to keep the State within the limits that were necessary within the social life of the community.

Sir Ernest Benn, the chief speaker, said that individualists were outside party politics, and were not likely to be enthusiastic members of any political party. They formed a considerable part of that pendulum that was needed to keep any party from swinging to extremes. They could be proud of the fact that during the three or four years of their existence they had exercised considerable influence on political thought. The country was faced with the question of the safety of democracy. He was a convinced democrat. He was alarmed to notice that not only in Italy but in other countries there was a definite challenge to the principle of democracy and all that it meant. Another question was the maintenance of the two party system. Thirty million voters were, he thought, capable of thinking intelligently in terms of two dimensions, but were not yet sufficiently advanced in political education to think in three dimensions. British government and British public life were based on the two party idea. The confidence and stability on which commerce and industry depended was only possible in a political situation governed by the two party system. Confidence and stability were the only real cures for unemployment. The work of the business man was to form his own judgment of the political prospects of the moment, and to proceed to act upon it. With two parties this was possible, but with a multi-political party such judgment was not easily formed.

Other speakers were Mr. Archibald Crawford, Sir Charles Marston, and Lord Lamington.

THE SOCIAL SIDE.

THE staff of the London Power Company met for dinner at the Connaught Rooms, London, on March 8th, the chairman of the company, Mr. W. F. Fladgate, presiding, supported by Mr. W. A. Pearman, general manager, and Dr. S. L. Pearce, engineer-in-chief. The attendance of over 200 comprised



Group taken at the sixth annual dinner of the Automatic Telephone Manufacturing Co., Ltd.

nearly the whole of the staff. After the loyal toast, the health of the chairman was proposed by Dr. Pearce, and in doing so he drew attention to the prominent part which Mr. Fladgate had taken in securing co-ordination for the electricity companies in London ever since his connection with the industry in 1890. Musical and comedy entertainment was provided.

The sixth annual staff dinner of the Automatic Telephone Manufacturing Co., Ltd., Strowger Works, Liverpool, was held on March 8th, in the Banqueting Hall of the Exchange Hotel. The attendance was the highest on record, some 170 members and guests being present. Sir Alexander Roger, chairman of the company, presided, and was supported by Mr. G. W. Moore, director and manager. The toast—"The Company"—proposed by Mr. C. Hitchen, was responded to by the chairman, whilst "Guests" were toasted by Mr. G. R. Maitland, Mr. E. A. Ward responding on behalf of the visitors. Other speakers during the evening were Mr. H. E. Powell-Jones, of the Telephone Development Association, and Mr. G. W. Moore.

I.E.E. SUMMER MEETING.

Preliminary Details of the Programme—Special Railway Concessions.

AT the invitation of the Société Française des Electriciens, the Summer Meeting of the Institution of Electrical Engineers this year will be held in France. A brief outline of the programme is to the effect that on June 11th the party will leave for Paris, lunching either at the Calais or Boulogne Maritime station or on the train between Calais (or Boulogne) and Paris. June 12th, 13th, 14th and 15th will be devoted to visits to various power stations, the wireless station at Sainte-Assise, the Carnot central automatic telephone exchange, etc., and excursions to Versailles, Malmaison, Chantilly and Sevres.

On the evening of Wednesday, June 12th, there will be a banquet (evening dress) given by the Société Française des Electriciens. On Sunday, June 16th, the party will leave Paris for Bordeaux, with a stop at Eguzon to inspect the dam and the hydro-electric station of the Paris-Orléans Railway. Lunch and dinner will be served on the train. On Monday, June 17th, members will leave Bordeaux for Pau, where in the evening they will be entertained at dinner (morning dress) by the South-Western Local Centre of the Société Française des Electriciens. Tuesday, June 18th, will be spent in visiting places of interest near Pau, including the Houra works and Eaux-Bonnes, the party proceeding to Lourdes in the afternoon. Excursions from Lourdes to works at Soulom and Gavarnie will be arranged for Wednesday, June 19th. On Thursday, June 20th, the party will leave Lourdes for Toulouse in the afternoon, spending Friday, June 21st, in an excursion to the old city of Carcassonne, returning to Toulouse in the evening. On Saturday, June 22nd, the party will leave Toulouse for Paris, arriving there about 10 p.m.

The approximate cost of the Paris portion of the meeting will be from £12 to £19 10s. per head (depending on class of hotel and route) and that of the whole trip (Paris and the Pyrenees) from £21 to £28 10s., which will include all transport, hotels and meals (except luncheons and dinners in Paris, and wines).

ELECTRICITY SUPPLY.

Bedford Scheme for Rural Supplies—Swansea Assisted Wiring Scheme—Additional Lines between Preston and Blackpool—Improvement of Portsmouth Sea Front Lighting—Fulham's Meter Charges—Hire-Purchase Wiring at Portsmouth.

THE Electricity Commissioners have declined to authorise the borrowing of £23 000 by Porthcawl U.D.C.

Eston Electricity Committee is considering the question of extending electric lighting to Low Lackenby district.

Whitehaven T.C. has received sanction to a loan of £263 for new electricity mains for public lighting at Seacliffe.

The Twickenham and Teddington Electric Supply Co. is carrying out mains extensions in Park Road, Hampton Hill.

Omagh U.D.C. has decided to consult an expert with regard to a proposal to promote an electricity supply scheme for the town.

A scheme has been approved by Bedford T.C. for supplying electricity in rural areas, at an estimated outlay of £100 000. The project covers 31 parishes.

Swansea Electricity Committee is to make application to the Electricity Commissioners for sanction to borrow £2 000 for an assisted wiring scheme.

Weymouth Electricity Committee has obtained sanction from the R.D.C. to the erection of overhead lines to afford a supply of electricity to Overcombe.

Hackney (London) Borough Council is applying to London County Council for loans of £16 438 for mains and £6 965 for transformers and switchgear.

The Central Electricity Board has acceded to the request of Cockermouth R.D.C. to erect the transmission line between Threlkeld and Egremont on a route which avoids the Whinlatter Pass.

Winchester T.C. has decided to carry out cable extensions for improving the supply to the lower end of High Street and to St. Giles' Hill and surrounding district, at an estimated cost of £4 865.

Under the East Notts Electricity Special Order (1928) it is proposed to extend the Supply (as regards Basford rural district) to Burton Joyce, Calverton, Gotham, Lambley and Woodborough.

Llanfrechfa Lower Council takes exception to the South Wales Electric Power Co.'s stipulation of a minimum revenue of £500 as a condition of its undertaking to equip the district for electricity distribution.

Ealing Electricity Supply Committee is to erect two transformer stations at Queen Anne's Gardens and Kingsbridge Avenue; and the Metropolitan Electric Supply Co. is to erect a transformer in Tennyson Road.

Okehampton T.C. has refused an application made by Mr. W. G. Heath, of Plymouth, for the consent of the Council to a Special Order authorising him to supply electricity for public and private purposes within the borough.

A protest has been sent to the Ministry of Home Affairs against the proposal to provide Belleek Pottery with electric power from the river Erne, on the ground that the health of the town would be endangered if the water supply were cut off.

Rochford R.D.C. has decided to offer no objection to the scheme of the County of London Electric Supply Co., for the supply of electricity to Hockley, Hadleigh, Canewdon, Rayleigh, South Benfleet, Great Wakering, Thundersley, Rochford, and Eastwood.

Blackpool Corporation has received permission to borrow £13 000 for underground mains, £6 500 for overhead mains and £20 500 for transformers and switchgear, in connection with the installation of additional h.t. transmission lines from Preston to Blackpool.

Gravesend Electricity Committee is seeking sanction to borrow £3 165 for providing eight 200 kVA transformers, five kiosks and e.h.t. switchgear. Cables are to be extended between El Teb sub-station, Cross Lane distributor and the Echo section pillar, at a cost of £780.

In connection with the scheme to supply electricity to the outlying portions of the borough of Bridgwater and to Bridgwater rural district, the T.C. has consented to the erection of steel tower overhead lines by the Bridgwater and District Electric Supply and Traction Co.

It is understood that, on the suggestion of the district auditor, St. Pancras (London) B.C. has decided to insert a clause in contracts for coal supplies required for the electricity undertaking providing for variation of prices in accordance with any fluctuation in railway freightage rates during the periods of the contracts.

Lowestoft Electricity Committee recommends that application be made to the Electricity Commissioners for sanction to a loan of £14 500 for main and distribution cables to supply energy to premises in the parish of Kessingland. The Committee is to apply to the Commissioners for sanction to a loan of £5 000 for the purchase of meters.

Chelmsford Electricity Committee has discussed the question of the present charges for electricity, and the future development and improvement of the supply in the borough. The Committee has instructed the Town Clerk to submit a general report upon the position, and upon the question of the desirability of acquisition of the electricity undertaking by the council.

Portsmouth Electricity Committee has considered the question of improving the public lighting along the sea front, and the Engineer and Manager has submitted a drawing showing an improved fitting, suitable for the present lamp standards, the cost of installation of which for the whole of the sea front lights would be £1000. The Committee has adopted the scheme.

Llantarnam Council is awaiting the official consent of the Electricity Commissioners before going on with the scheme for private and public lighting in the district. The Council will apply to the Commissioners for sanction to borrow £17 500 for carrying on the scheme, with £650 for public lighting. Tenders amounting to £12 630 for carrying out the work have been provisionally accepted.

Hackney (London) Electricity Committee recommends that Messrs. May and Hawes be appointed consulting engineers in connection with the proposed extension of the generating plant at the generating station, under the South-East England Electricity Scheme, at a fee of 1% upon the capital expenditure on plant, subject to a maximum of £3 500, such fee to include travelling and other expenses.

A scheme has been adopted by Lewes T.C. for extending the public electric lighting, under a ten years' contract with the Lewes and District Electric Supply Co., Ltd. Under the new arrangement the consumption will be increased from 64 000 to approximately 125 000 kWh per annum, and the company will bear the whole capital cost, with the maintenance and renewal of lamps and fittings.

It is estimated that the maximum demand of the supply to Worthing, which it is proposed should be provided by Brighton and supplied through the medium of the Central Electricity Board, will rise from 700 kW in 1929-30 to 1 900 kW in 1932-33, and that the demand of Haywards Heath (to be supplied in a similar way) is estimated at 100 kW. Mr. John Christie, borough electrical engineer of Brighton, recommends that 2 000 kW should be inserted in the agreement with the Central Electricity Board, and the Town Clerk has been instructed to complete the agreement with the Board on this basis.

Portsmouth Electricity Committee recommends that wiring of dwelling-houses in the city, upon the hire-purchase principle, be undertaken by the Corporation upon the following conditions:—The cost to be refunded to the Corporation by the consumer by a payment of 10% of such cost upon his signing the agreement, and payment of the remainder by equal quarterly instalments over a period of five years, with interest at 6% per annum upon the amount outstanding; the scheme to be limited to private houses in the city, and within 60 feet of existing mains, and not to apply to houses in the course of erection; the first lamp and shade to be provided by the Corporation for each point wired.

Fulham (London) Electricity Committee reports that it has been represented that the payment of meter rent by small consumers of electricity for power purposes entails a hardship upon them. A total discontinuance of the rent for power meters would involve a loss to the undertaking of about £1 150 per annum, and the Committee does not consider that it would be advisable to discontinue meter charges entirely. It recommends that the present charge of 2s. 6d. per quarter for meter rent for power purposes be discontinued where the minimum quarterly consumption is not less than 60 kWh, and that where the quarterly consumption falls short of 60 kWh a charge be made equivalent to the difference between the value of the current consumed and the charge for 60 kWh.

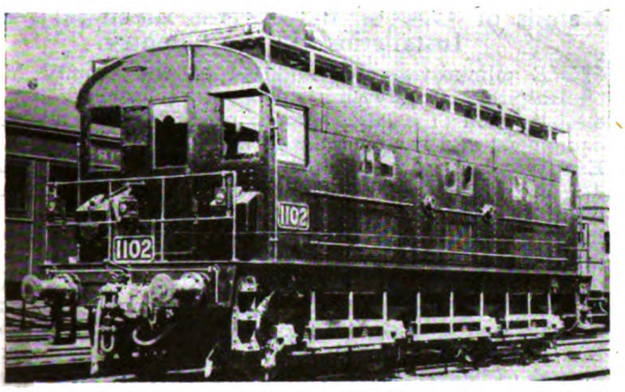
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Among the exhibits at the recent exhibition of modern industrial art, in New York, is the "fountain" illustrated above. The design is suggestive of a garden statue, and, by means of interrupted lighting of the tubes, the effect of a playing fountain is produced.

A French electrical device which, when fitted to a railway line will, it is claimed, indicate, within reasonable limits, the distance of an approaching or receding train.

Mr. Antony Simon, whose death on March 8th is referred to on page 353. He was for many years manager of Continental Sales for the Metropolitan-Vickers Electrical Co., Ltd. He was also a director of several subsidiary companies operating on the Continent.



One of the seven new types of electric locomotives to be built by the Victorian Railways Department for goods and shunting purposes. The Victorian Railway Commissioners, convinced of the increased speed of electric loco's., have adopted them wherever possible.

The pier entrance of the new Bournemouth Pavilion, which was opened on Tuesday. It will be remembered that Bournemouth is the scene of this year's E.C.A. Conference, to be held from June 26th to 28th. A description of the Pavilion is given on page 354.

Group of members of the Electrical Association for Women, with Mrs. Wilfrid Ashley, president, in the centre, after inspecting the all-electric kitchen on the restaurant car attached to the "Flying Scotsman." The inspection was made at King's Cross (London) Station, and a very comprehensive demonstration was given by the chef.

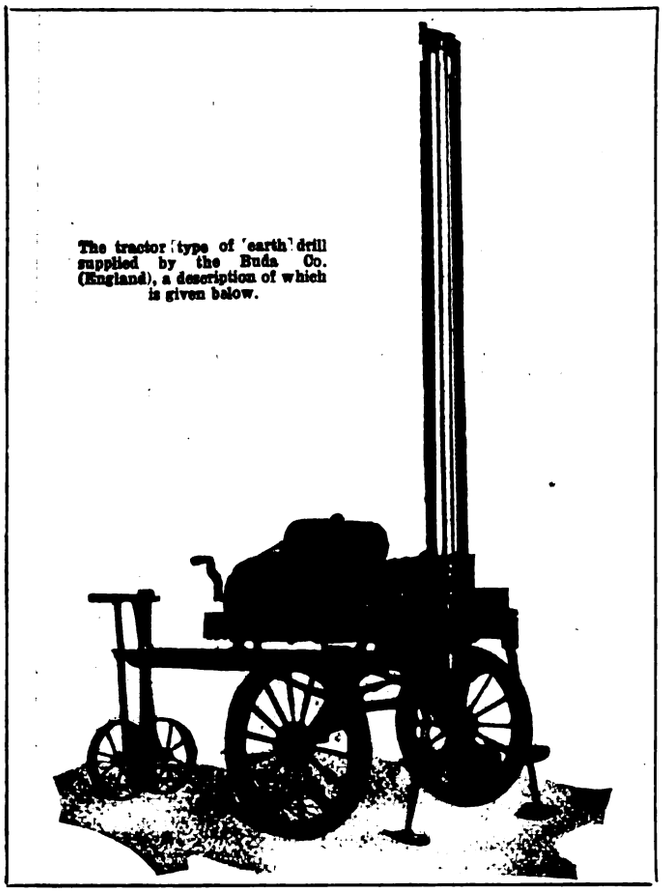
EARTH DRILLING.

Equipment for the Erection of Poles for Overhead Power Transmission.

THE Buda-Hubron earth drill by the Buda Co. (England), of 75, Evershot Road, London, N.4, is designed for digging holes for telegraph, telephone, power, and other poles to a depth of 10 feet or less with diameters of 13, 17, 19, 22, and 24 in. It is also adaptable for drilling blast holes and anchor holes, special equipments being supplied for these purposes.



The tractor type of 'earth' drill supplied by the Buda Co. (England), a description of which is given below.

It will dig 1½ in. diameter blast holes to depths of 15 ft., and 6 in. diameter anchor holes to 15 ft. The drills for holes for telegraph and power poles are formed of a single cast steel helix, polished on the top, and provided with a hinged shutter. Removable manganese steel cutters are provided for bolting on to the lower side of the helix. These cutters are of different types to take care of varying soil conditions, and, being separate from the helix, can be removed for re-sharpening and renewal. The helix is bolted to the bottom of the spindle, which, when engaged with the clutch, forces the helix down into the earth. The latter, dug up by the cutters, is forced up through a hinged shutter, so as to leave the portion being drilled clear of loose earth, thus permitting economy in power. When about 2 ft. of earth has collected above the helix, the drive clutch is disengaged and the drill raised to the surface by the engaging of the lifting clutch. The drive clutch is then again engaged, and the earth dispersed from the top of the helix, the hinged shutter and drill preventing any return of the earth into the hole. The drill will dig in clay, hard pan and shale, stones up to 4 in. diameter easily passing through the hinged shutter. The speed of drilling depends upon the character of the ground, but in heavy clay a 20 in. diameter hole can, we are advised, be drilled 6 ft. deep in three minutes, while on blast hole work in solid shale it will dig on an average 140 to 180 ft. per day.

The machine is supplied in three different styles, the trailer type is mounted on two wide steel tyred wheels 4 ft. in diameter, or 3 in. solid rubber tyred wheels can be furnished if preferred. The axles are mounted on roller bearings and being mounted on elliptic springs, the machine can be easily towed. It can be used for drilling holes on rough or uneven ground, as the tongue is adjustable and the desired angle can be secured by changing the position of the tongue post. The weight of the machine is approximately 1 850 lb., and due to this comparative lightness the machine is mounted on springs, which move upward when the drill strikes an obstruction. In addition, the cone friction clutch, connecting the engine to the main shaft, will slip when necessary. Hyatt roller bearings are used on the main drive shaft and all drive gears are enclosed and run in oil.

Another type of machine, supplied for mounting on a motor lorry, is much the same as the trailer type, but, instead of being mounted on wheels, is mounted on a sub-frame for bolting to the platform of the truck or lorry. This sub-frame is designed so that the drill and spindle may be tilted fore and aft to an angle of 25° and 12° to either side. A third type of machine comprises the earth drill equipment mounted on the front of a Fordson tractor on an extension frame, the equipment including a pole hoisting boom, boom winch, hoisting winch, and the necessary operating mechanism. The wheel base of this unit is 108 in., and its power is taken from the tractor engine by means of a belt. The tractor is equipped with special wheels which have rubber tyres with steel extensions, so that the machine can be used for both highway and cross-country work. In soft going, chains can be thrown round the wheels, which are of the open type. The winch supplied is of the worm type with reverse gear, so that power has to be used to lower the load. The winch will handle a two-ton load on a single line. The derrick is made up of jointed sections of heavy steel tubes, the standard being in two sections, each 14 ft. in length, though an additional 10 ft. section can be supplied if wanted. This derrick with extensions is capable of handling 75 ft. poles. It can also be used for loading poles and handling transformers and other equipment.

ELECTRICAL BAKING.

Details of One of the Largest Electrical Baking Installations in the Country.

THE administrative committee of the County Mental Hospital at Prestwich has adopted a scheme involving the electrification of a large amount of its bakery and kitchen equipment, and has placed with the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., a contract for the apparatus required. The installation will be one of the largest of its kind in the country, its service being to cater for patients and staff totalling, in all, about 1 200 people. The equipment to be supplied includes two electric baking ovens of a size to bake 400 lb. of bread each at a time. They will be of the Metrovick "Conveyor" type, in which the bread or confectionery to be baked is loaded on a number of trays which are carried round the oven by a motor-driven conveyor mechanism during the process of baking, so that the whole batch is evenly baked. The ovens will be equipped with an automatic temperature control device, so that on being switched on they are brought up to any desired temperature and maintained at that temperature without any attention, an arrangement which, besides being convenient, also saves spoilage which might be caused by over-heating. The installation will also include a kitchen range, three roasting ovens, a fish fryer, hot closets and carving tables, all of large size and electrically heated, and also a number of large steam-heated boiling and steaming pans and other kitchen utensils. These items will be supplied by MOORWOODS, LTD., of Sheffield, on a sub-contract.

Each of the baking ovens of this type has a rating of 50 kW, twelve elements being incorporated. Automatic and hand control is provided. Mounted on the inner framework is a chain conveyor of the type used in travelling ovens to which a number of baking trays are fixed permanently, and upon which the goods to be baked are placed either directly or on sheets. During baking, the conveyor is driven by a small electric motor, and travels slowly round the oven at such a speed that every article in the oven passes the door once each minute. The motor is mounted externally and started and stopped by a small switch mounted just below the oven door. The conveyor can be moved round by hand if desired.

NEW TYPE TURBO-ALTERNATOR.

We have received from METROPOLITAN-VICKERS ELECTRICAL CO., LTD., of Trafford Park, Manchester, a copy of leaflet 452/1 describing a new type of steam turbo-generator which, it is claimed, possesses many advantages for the ordinary industrial power requirements up to about 4 000 kW. It is further claimed that the initial costs of installing the plant are reduced, while economies and ease of operation of plants of these sizes are improved. A full description of the plant was given in THE ELECTRICIAN of October 12th, 1928.

TRADE PUBLICATIONS.

A CATALOGUE of "Clix" products has been sent to us by LECTRO LINX, LTD., 254, Vauxhall Bridge Road, London, S.W.1.

List No. 23/29, dealing with electrical supplies, has been published by FORSE WHOLESALE, LTD., Traffic Street, Nottingham.

Folder E8, dealing with cooker control units, has been published by J. H. TUCKER AND CO., LTD., King's Road, Tyseley, Birmingham.

Two- and three-pin sockets and plugs are the subject of Folder A4, by J. H. TUCKER AND CO., LTD., King's Road, Tyseley, Birmingham.

List No. 48, by VENNER TIME SWITCHES, LTD., 45, Horseferry Road, London, S.W.1, deals with solar dials, their construction and use.

A special publication dealing with electric furnaces has been received from the ELECTRIC FURNACES CO., LTD., 17, Victoria Street, London, S.W.1.

"Elect" cooking and heating appliances are the subject of a special counter showcard issued by THE ELECTRIC HEATING CO., of George Street, Croydon.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have issued a new folder concerning the "Phililite" fittings described in our last issue.

List D.C./58 illustrates and describes the No. 46 table type cooking cabinet of the JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1.

The 1929 edition of the booklet, "Renold Stock Chain Drives," has been received from HANS RENOLD, LTD., Burnage Works, Didsbury, Manchester.

The SAXONIA ELECTRICAL WIRE CO., LTD., Roan Works, Greenwich, S.E.10, has published a new reference and conversion table relative to wires and cables.

The PARSONS OIL ENGINE CO., LTD., Town Quay Works, Southampton, has issued catalogue No. 98, describing the company's 10/20 H.P. engine, a new product.

Leaflet L 4933, by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, is descriptive of "Geeko" lighting and starting accumulators.

Leaflet No. 200, describing electrically-driven air compressors and pumps, has been issued by ARNOLD GOODWIN AND SONS, LTD., Southwark Bridge, London, S.E.1.

A special window bill in connection with the type C.2 loud speaker has been issued by the BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, London, W.C.2.

A new edition of the Glassware catalogue has been released by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2. The reference is Section F (3).

The MIDLAND ELECTRIC MANUFACTURING CO., LTD., Barford Street, Birmingham, has issued a new leaflet devoted to the description of d.p. main switches and 2-way d.p. fuseboard units.

Catalogue Section No. 27-2, dealing with outdoor type, motor-operated induction regulators, has been sent to us by SWITCHGEAR AND COWANS, LTD., Elsinore Road, Old Trafford, Manchester.

The A.E.G. ELECTRIC CO., LTD., 131, Victoria Street, London, S.W.1, has published list X 1 105 E, dealing with domestic electric appliances; and list X 1 108 E, describing the company's electric fires.

The BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, London, W.C.2, has issued leaflet L.466, dealing with the company's electric freezing unit, and L.463, dealing with lighting fittings.

The BRITISH THOMSON-HOUSTON CO., LTD., has also published L.462, dealing with the company's new electric refrigerator, described in our issue of March 1st. L.465, giving sizes and prices, has been issued.

The REGENT LAMPSHADE CO., Imperial Works, 16, Brighton Terrace, London, S.W.9, has published a new catalogue illustrating and describing a newly introduced range of vellum shades coloured on both sides of the material.

Leaflet No. X220, dealing with totally enclosed ironclad industrial oil switches, types M.1, 650 V, and M.3, 650 and 3 000 V, has been published by J. G. STATTER AND CO., of Queen Anne Chambers, Westminster, London, S.W.1.

The A.C.E.C., 56, Victoria Street, London, S.W.1, has sent us a new publication, produced by the cable department, by way of showing in illustrated form the facilities available at the company's works. In order that the publication should be of the greatest possible use, the descriptions under each photograph are given in five languages.

WINDOW LIGHTING.

Interesting Scheme Introduced Into One of London's Popular Windows.

THE difficulties of colour lighting a shop window display are generally more manifest than the advantages, and although this is perhaps because a true appreciation of colour as an asset is not fully understood, there seem to be few

A window which has been fitted with a special lighting system for illuminating furniture displays.

installations which have been devised for satisfactory and easy working by the display manager. Not only should the system be flexible, but it should offer the simplest method of colour changing. It should make it possible to effect a change upon the same merchandise without the necessity of undressing or disturbing the window. Moreover, it should be understood that all lighting should be used to accentuate the colours or shapes of goods and should not be employed to produce false effects. With this object in view it is soon evident that a basis of white light—for good illumination—is necessary, and colours, although subsidiary, should be present in adequate strength.

The window of the new Drage extension in High Holborn, London, is arranged with such a system by the THOMAS J. DIGBY ILLUMINATING ENGINEERING CO., LTD., of 12, Gerrard Street, London, W.1, for the special illumination of furniture. The main lighting is derived from standard overhead battens and small floor lanterns equipped with stainless steel reflectors, and switched in sections. In passing it may be mentioned that although the foot candle power is high, actual experiment, for some time before the work was scheduled, prescribed the energy necessary to overcome the tremendous front reflections in the window. Masked behind the interior pelmets is a series of colour battens constructed for the most part in a novel manner. Light cast aluminium lamp housings are spaced at 18 in. intervals within a system of brass rails. Rolling on the rails is an arrangement of glass screens, four separate colours to each lantern, each section of batten having thin steel lines for remote control *behind* the window. The housings, although small, are capable of accommodating lamps ranging from 100 W to 500 W, and each has above the lamp a bell mouth communicating with a common ventilator exhaust system whereby the overheated air is drawn away immediately. The efficiency of this method is such that after prolonged burning it is still possible to place the hand comfortably on the lanterns.

WIRELESS RECEIVER DESIGNS.

We have received from FERRANTI, LTD., Hollinwood, Lancs, a number of wiring diagrams for the home constructor, the details of which are H.T. Supply Unit No. 1, for use on 200/250 V, 40/70 cycle mains, with a total output of 200 V, 100 mA; similar units with stated outputs of 200 V 80 mA, 160 V 50 mA and 200 V, 80 mA. Other wiring diagrams are for a two-valve set for local stations and 5 XX, and D920, which describes how to operate a "Melody Maker" receiver from a.c. mains by means of a Ferranti mains unit. A three-valve set for long-distance work is also published in diagrammatic form. The charts are free to the trade and public upon request.

COMPANY NEWS.

Big Rise in Price of C.E.C. Shares—Northampton Company's Successful Year—London Electric Supply Corporation's Increased Revenue—New Petrol Electric 'Buses—Directors' Reports and Dividend Announcements.

THERE has been considerable buying of General Electric shares during the past few days, and as compared with a week ago the price quotation, at 63s. 9d., shows a rise of 8s. 9d. County of London Supply shares have also more than regained last week's drop, and are 1s. 6d. to the good at 53s. 6d. Westminster and Yorkshire Power shares have weakened. Underground Electric Rlys. ordinary shs. have regained 1s. Marconi International Marine shs. have been sold, and have dropped 5s. to below 64s.; Marconi's Wireless shs. are slightly better, and Eastern Telegraph stk. has recovered. Equipment shares have been variable.

HADFIELDS, LTD.—Div. of 2½%, less tax, proposed for year 1928, agst. 5% for 1927.

GLOBE TELEGRAPH AND TRUST CO., LTD.—Intm. div. of 5s. per sh., net, will be payable on March 28.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO., LTD.—Fin. div. for 1928 of 5s. p. sh., payable tax free, on Apl. 15.

CHELSEA ELECTRICITY SUPPLY CO., LTD.—Fin. div. of 11·3d. p. sh. on ord. shs. is announced, makg, standard div. for year.

EASTERN TELEGRAPH CO., LTD.—Div. at rate of 3½% p. a., less tax, on pref. stk. for qrtr. endg. March 31, div. of 2½% on ord. stk., tax free, for qrtr. ended December 31, 1928, will be payable on April 15.

HENDON ELECTRIC SUPPLY CO., LTD.—Net surplus for 1928, £39 811. Fin. div. 2s. p. sh., tax free, makg. 15%. To repairs and renewals, £8 293; to gen. res., £4 728; income tax acc., £5,900. Fwd., £9 628.

COUNTY OF DURHAM ELECTRICAL POWER DISTRIBUTION CO., LTD.—Pft. for 1928, £59 299, agst. £44,966, plus £887 brt. in. Int. on deb. stk., loans, etc., £26 862. Ord. div. 6%, subject to tax (same as last year). Fwd. £1 224.

TEES POWER STATION CO., LTD.—Pft. for 1928, £122 231, agst. £85 672. Int. on debs. and advances required, £63 213, agst. £27 774. Div. 6%, subject to tax, agst. 5%. Fwd. £750 (agst. £1 311 for 1927, after placg. £10 000 to res.).

MERSEY POWER CO.—Working pft. for 1928, £100 869, plus £36 420 brt. in. To loans redemptn., £20 000, int., £41 072. Div. 5% on ord. shs.; to depreciatn., £30 000 fwd., £17 080. Sales of electy. increased by nearly 6 000 000 kWh.

LANCASHIRE DYNAMO AND MOTOR CO., LTD.—Pft. for 1928 £21 002, plus £5 350 brt. in. Div. on pref. shs., 5½%, less tax, includg. intm. div. paid to June last. Ord. div. 5% for year, less tax. To res. for directors' fees, £700, to res. acct., £5 000. Fwd., £7 800.

AMERICAN CABLE AND RADIO MERGER RUMOURS.—Mr. J. G. Harbord, president of the Radio Corporation, announces that there are no negotiations completed or pending towards a merger or consolidation of any kind between the Radio Corporation and the Western Union Telegraph Co.

NEWCASTLE AND DISTRICT ELECTRIC LIGHTING CO., LTD.—Pft. for 1928, £72 809, plus £15 658 brt. in. Int. on debs. and loans, £17 933, to deb. and leasehold redemptn. funds, £4 970; depreciatn., £22 000; to gen. res., £10 000; div. at rate of 7½%, less tax, for year £18 000; fwd., £15 564.

AUTOMATIC TELEPHONE MFG. CO., LTD.—Pft. for 1928, £123 670 (after charging depreciatn. £50 000), plus £81 755 brt. in. Directors' fees, £2 442; to gen. res., £35 000; pref. div., £12 000; intm. div. on ord. shs. (3¾%), £18 750. Directors recommend further div. of 6¼% on ord. shs., makg. 10%, less tax, for year, and a bonus of 2½%, less tax, Fwd., £93 483.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD.—Pft. for 1928, £819 456, agst. £783 493. Int. on deb. stks., loans, etc., absorbed £204 670, agst. £221 465; to res. for special depreciatn. and contingencies, other than equalisatn. of divs., £150 000 (same as last year), to res. for plant renewals, etc., £60 500. After paying divs. on 7% and 5% pref. shs., fin. div. of 3½% on ord. shs. is recommended, makg. 6% for year, subject to tax. Fwd., £80 653, agst. £43 206.

GENERAL ELECTRIC CO., LTD.—It was officially announced on March 16 that the offer for sale of 1 500 000 British £1 ord. shs. had been postponed. The committee representg. American shhldrs. asked that the sale should be deferred pendg. negotiatns., and Sir Hugo Hirst agreed to the adoptn. of this course. Sir Hugo stated that the Board's financial advisers had elaborated a plan which in the directors' opinion safeguarded the objects which they had in view, and which he defined at the shhldr's. mtg. on March 13. Sir Hugo having suggested that a representative should negotiate on behalf of American interests, the American committee cabled on Monday that its two representatives, Mr. T. L. Chadbourne and Mr. H. B. Swope, would sail for England in the *Aquitania* on March 23, or the first vessel available. In acknowledging this, Sir Hugo said the Board was on the point of completing proposals on lines which they felt would meet all reasonable criticism levelled agst. its first proposals and which might

Digitized by Google

avoid the necessity of the representatives taking the journey across. In a subsequent cable, members of the committee of United States shhldrs. stated that they would not name someone in London to be in touch with the co., as no member of the committee was there, and added that Sir Hugo, personally, had not vouchsafed to them any indication of changes intended to be made in the proposals passed by the mtg. on March 13th.

Company Meetings.

LIVERPOOL OVERHEAD RAILWAY CO.—Ald. M. H. Maxwell, presiding at the meeting on March 13th, said the net income for 1928 was £22 284, compared with £14 758 in 1927, and the passengers carried were 7 511 559, or 183 383 more than in 1927. Mr. C. H. Keet, a shareholder, said if the ordinary shareholder was to have any satisfaction it was necessary for the board to adopt a more enterprising policy. The proposal to pay the full year's dividend of 5% on the preference shares was criticised, but the motion for the adoption of the report was carried.

NORTHAMPTON ELECTRIC LIGHT AND POWER CO., LTD.—Mr. F. H. Thornton, presiding at the recent meeting, said in spite of the general prevalence of bad trade, they had a very successful year. During the year they obtained statutory powers to carry out the extensions, to which he alluded last year, in Northamptonshire and North Buckinghamshire. Their area consisted of some 1 000 square miles, and they were now supplying in all 80 towns and villages. During the year they had added 44 miles to their extra high tension mains, and 23 miles to their distributing mains, making a total of 188 miles of high tension mains and 132 miles of distributing mains. The board looked forward with confidence to the results of the extensions that would take effect during the present year. The meeting confirmed the dividends of 2½ % on the 5% cumulative preference shares, making 5% for the year and 5% on the old ordinary shares, making 9% for the year.

LONDON ELECTRIC SUPPLY CORPORATION, LTD.—The Earl of Bessborough, presiding at the meeting on March 13th, said in spite of reductions in prices of current, their revenue had grown from £693 926 in 1927 to £708 542 in 1928, and net profits were £181 206, compared with £127 594. Final dividends making 6% on the preference and 9% on the ordinary shares for the year were recommended. The benefits consumers received during 1926, 1927 and 1928, due to their being charged less than the standard price, amounted to approximately £300 000. The sale of their Deptford generating station to the London Power Co. was completed in March last. The Power Co.'s new station on an adjoining site, and the capacity of which would be ultimately about 200 000 kW, was expected to be in commission shortly. Their "all in" tariff, although it had only been in operation for a month, had been adopted by a large number of consumers. Their next step would be to open a showroom in their residential area. The report was adopted and the dividends were approved.

SCOTTISH POWER CO., LTD.—Mr. George Balfour, M.P., presiding at the meeting on March 13th, said the extensions to the steam generating stations at Bonnybridge and Arbroath had proceeded satisfactorily. The Arbroath extensions were carried through in two stages, and the first generating set has been on load for several months. The combined generating plant installed would then amount to a total of 32 500 kW. In addition, there are, of course, the smaller units of generating plant at Montrose, Brechin, Crieff and Kingussie, which were gradually being superseded as bulk supplies were afforded by the Grampians Co. A start was made on the construction of the hydro-electric works of the Grampians Co. at Rannoch during the early part of the year and the works were proceeding so as to be completed for supply by the end of next year. From the hydro-electric station a 132 000 V line would be carried to Abernethy, south-east of Perth, for connecting into the main transmission lines of the Central Electricity Board. The report and the dividend at the rate of 8% per annum on the ordinary shares were approved.

TILLING-STEVENS MOTORS, LTD.—Mr. H. E. Carter, presiding at the recent meeting, said they had completed the manufacture of eight new and entirely up-to-date petrol-electric chassis for test in service, and some of these would be running upon the London streets as soon as the bodies were erected upon them. The chassis had already been passed by Scotland Yard, and there only remained the passing of the final vehicle complete with the body. From their own tests and from the running of a similar engine and dynamo for over 20 000 miles in Wolverhampton, they had every reason to believe that the results would give satisfaction. They had also given close attention to petrol-electric commercial vehicles, and had now in production standardised engines of two types, of different sizes and power, suitable for both passenger and goods vehicles, either of which could be supplied gear-driven or electrically propelled. He thought they were the only company in this country able to offer customers both types and to advise them as to which was the more economical and satisfactory for their particular conditions.

CHISWICK ELECTRIC SUPPLY CORPORATION, LTD.—Mr. Harry Kahn, presiding at the general meeting, said the number of consumers had reached 6 283, an increase of 480, and the total revenue £85 949, or £5 484 higher than last year, while total profits at £52 430 showed an improvement of £7 254. Both at Chiswick and Aberystwyth their rates would cost considerably more, as their assessments had been practically doubled. At Chiswick, on the basis of the new assessment, at the present scale the rates alone would work out at ¾d. per kWh. The Press and public were apt to overlook items like this, as also interest and depreciation on capital sunk in machinery and mains, when agitating against the so-called exorbitant prices charged for current. The net

IN the above illustration are seen 638 members of the B.T-H. (Rugby) Ex-Service Association which, besides running various social events for the benefit of members, is now turning its attention also to helping local charitable institutions having no direct connection with the B.T-H. The Association has enrolled over a thousand members—about one-sixth of the employees of the main works of the company.

Digitized by Google

result was that, with the balance brought forward, there was £35 653 10s. 4d. available for distribution, of which £11 250 had been absorbed by the interim dividend of 7½% actual paid on July 23rd, 1928. This left £24 403 10s. 4d., which the directors recommended be appropriated as follows: In payment of final dividend of 8½% actual, £12,750; refund to consumers for 1928, £9 000; carry forward, £2 653 10s. 4d.

ENGLISH ELECTRIC CO., LTD.—Mr. W. L. Hichens, presiding at the meeting on Monday, said whereas there was a loss of £134 450 in 1927, and provision had to be made for exceptional losses, in 1928 there were no exceptional losses, and the loss for the year was reduced by over £100 000 to £33 600. The trading profit for 1927 was £66 000 better than in 1926. He hoped that if prices did not fall below the present low level, and if the same volume of orders were secured as during the past year, the company would continue on the up grade. There had been an increase in the value of British export trade in electrical machinery, due to the high level of efficiency it had attained. The English Electric Co. had secured an important share in this foreign business. Of the orders secured through the Power and Traction Finance Co., the 45 000 kW power station near Athens would probably be in operation in June, and considerable progress had been made with the 65 000 kW station near Budapest. The Power and Traction Finance Co. had other schemes under consideration, notably two hydro-electric schemes in Scotland. The position of the company had been materially strengthened. The report and accounts were adopted.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD.—At the meeting on March 14th, Col. R. E. Crompton, chairman, said they were working on their policy of providing mains suitable for the new standardised system of alternating current distribution, which required that they provide suitable static transforming sub-stations. This would entail further capital expenditure. The item "purchase of current" had risen from £57 945 in 1927 to £66 522, due to an additional one and a quarter million units purchased. Their net profit for 1928 amounted to £33 569, compared with £43 868 in 1927. Their future prospects were very good. Judging from their returns during the first few weeks of this year it is evident that another substantial advance in output and in additional connections might be expected. Their showrooms had been successful in attracting the attention of consumers and they were there able to demonstrate to them the latest and most economical methods of using electrical appliances for all purposes. The business of providing electric cooking apparatus had increased and was likely to still further increase. Customers using electric cooking seemed to be satisfied with the results from the economical point of view. The report was adopted.

SOUTHERN RAILWAY CO.—Brig.-Gen. Everard Baring, presiding at the meeting on March 6th, said capital expenditure on the electrification of suburban lines in 1928 was £115 000. This item would have been larger if they had charged to capital the expenditure incurred in providing the electrical equipment of the line that would replace the overhead system. On the previous Sunday they inaugurated the last stage of the two extensive schemes of electrification. The first scheme was completed in July, 1926, and the second scheme was opened last year. Up to the present time they had electrified 270 route miles and 748 track miles, over 13% of their total track mileage. They had recently authorised the electrification of the line from Wimbledon to West Croydon via Mitcham, six and a quarter miles, and the line from Twickenham to Windsor, about 13 miles. The Wimbledon and Sutton Railway, which would be completed this year, would also be electrified. By the end of this year they would have abolished the single-phase, overhead system on the former L.B. and S.C. section, and have substituted the d.c. system. After allowing interest upon the whole of the expenditure and bringing to debit the whole of the costs, there was a very considerable profit which had gone a long way in helping to pay the dividends on the deferred stock.

MATHER AND PLATT, LTD.—Mr. L. E. Mather, presiding at the recent meeting, said profit showed a slight increase. The amount available for distribution was sufficient, the board considered, to recommend the same dividend and bonus as for the previous six years, and still to leave a reasonable carry forward. They continued to improve their workshop plant at Newton Heath and Salford with labour-saving machinery without displacing labour. Their research department and designers had been busy on development work during the last year or two with increasingly good results. Electrically, they had further developed the standardisation of their dynamos and motors, resulting in increased sales. Their geared generators and converting plant had also been in demand, so that their total output of electrical machines for 1928, as regards numbers sold, manufactred, and held, constituted a record in the history of the company. The outlook at home seemed somewhat brighter. Their French company continued to show a good profit, in spite of considerable competition. Their German company reported more favourably than for some time past. India continued to provide them with many inquiries, and an improvement had already been noticeable from China. Japan continues a good customer, in spite of the increasing tendency to manufacture as much as possible.

New Companies.

EMERY AND CO., LTD.—Cap., £500. Electrical, lighting, wireless and general engineers, etc. Solicitors: Sproston and Son, Newcastle-under-Lyme.

HEALING RAYS, LTD.—Cap., £300. Medical and general electricians, radiologists, etc. Reg. office: Arkwright House, Parsonage Gardens, Manchester.

EIRCO (WHOLESALE), LTD.—Cap., £100. Electrical engineers, manufacturers of electrical equipments, dealers in wireless, etc. Reg. office: Kingscourt, Wellington Place, Belfast.

LEAVERS' (HENLEY), LTD.—Cap., £4 000. To acquire business of motor engineer and repairer, wireless and electrical engineer, carried on by W. E. Leaver at 2, Reading Road, Henley.

RAY THERAPY INSTITUTES, LTD.—Cap., £2 000. Proprietors of electrical and sun ray treatment establishments, etc. Solicitors: Woolfe and Woolfe, 13A, Old Burlington Street, London, W.1.

POWER CENTRE CO., LTD.—Cap., £1 500. To acquire business of switchboard manufacturers and electrical and mechanical engineers now carried on at 15, Park Lane, Liverpool, as "The Power Centre Co."

CLARENDON PRESSING AND WELDING CO., LTD. Cap., £3 000. Manufacturers of and dealers in motor vehicles, electrical engineers, etc. Reg. office: Clarendon Works, Clarendon Street, Coventry.

PERTRIX, LTD.—Cap., £10 000. Electricians, electrical and mechanical engineers and contractors, suppliers of electricity, and manufacturers of and dealers in electric batteries. Reg. office: 120, Tottenham Court Road, W.1.

COLLEYS (1929), LTD.—Cap., £10 000. To manufacture telegraph coils and inventions in connection therewith, to adopt agreement with Exchange Telegraph Co., Ltd., etc. Reg. office is at 3–6, Marine Street, Bermondsey, London, S.E.

HUDSON, Mr. R. C., 1, Bridge Road, Chatburn, radio engineer, £22 6s. 6d. February 5th.

SOUTHALL, Mr. S., 29, High Street, Welshpool, electrical engineer. £11 5s. 5d. January 28th.

VICTORIA WIRELESS AND GRAMOPHONE STORES, 47, Morton Street, S.W., wireless and gramophone dealers. £39 2s. 7d. February 4th.

Deeds of Arrangement.

PATTEN, Charles Edward, trading as COVENTRY RADIO EQUIPMENTS, 61, Clay Lane, Coventry, electrical outfitter. Dated March 11th, filed March 14th. Trustee, H. J. Kirby, 26, Trinity Churchyard, Coventry, accountant. Liabilities unsecured, £555; assets, less secured claims, £490.

SMITH, Stanley Carlos, 10, Facade, Devonshire Road, and 108, Devonshire Road, Forest Hill, wireless dealer. Dated March 7th, filed March 14th. Trustee, W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C., accountant. Liabilities unsecured, £1 024; assets, less secured claims, £500.

Receivership.

IZZARD BROTHERS, LTD.—W. B. Pearson, Corporate Accountant, of 5, John Street, Bedford Row, W.C.1, was appointed receiver and manager on February 28th, 1929, under powers contained in certain debentures dated December 22nd, 1925.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

ELECTRICAL APPLIANCES (BLACKPOOL), LTD.—This company, whose debenture holders have appointed a receiver, was formed in March, 1920, with an authorised capital of £5 000, increased in October, 1920, to £7 500 in £1 shares, of which 6 500 shares have been issued, all for cash. According to the latest return filed, the directors were William Outhwaite, George Outhwaite, R. T. Waite and W. T. Rawcliffe, with 1 400 shares each; and H. F. Shanshaw, holding 700 shares. There was one other shareholder, a chartered accountant, holding 200 shares,. William Outhwaite, on behalf of the debenture holders, appointed the receiver.

London Gazette, etc.

Bankruptcy Information.

HALL, Sidney (trading as E. GREEN AND CO.), 13, Caledonian Road, Leeds, and 30, Leighton Lane, Leeds, electric lamp dealer, First meeting, March 25th, 11 a.m., Official Receiver's Office, 24, Lower Bond Street, Leeds. Public examination, April 9th, 10.30 a.m., County Court House, Albion Place, Leeds.

Notice of Dividend.

JONES, Edward Denis, Royal Sportsman Hotel, Portmadoc, Carnavon, electrical engineer. First dividend, 1s. per £, payable April 5th. Official Receiver's Office, St. Peter's Churchyard, The Cross, Chester.

Notices of Intended Dividends.

SHARPE, Henry Clifford, 4, Gordon Terrace, Dorchester, wireless engineer. Last day for receiving proofs, March 30th. Trustee, T. Barton, City Chambers, Catherine Street, Salisbury, official receiver.

WILSHAW, George Marshall, and SHARPE, George, trading as WILSHAW AND SHARPE, 320, Padiham Road, Burnley, electrical dealers. Last day for receiving proofs, March 29th. Trustee, J. W. Carter, District Bank Chambers, Blackburn, official receiver.

Partnerships Dissolved.

GREER, SON AND DIGGINS, electrical and automobile engineers and contractors, 99, Canal Crescent, Perth, by mutual consent, on January 21st, 1929, by the retiral of James Crofton Diggins one of the partners. Under the firm name of GREER AND SON the business will continue to be carried on at the same address by Leonard Allan Greer and Leonard Allan Greer, Junior, who will pay all debts due by, and collect all debts due to, the dissolved firm.

JACKSON (H. A.) AND CO. (Jane Anderson SINGLETON, formerly Jane Anderson Jackson, and Robert RAMSDEN), manufacturing electrical engineers and merchants of electrical goods, Caxton Hall, Chapel Street, Salford, by effluxion of time as from December 31st, 1928. Debts received and paid by R. Ramsden, by whom the business will be carried on.

MANCHESTER MAGNETO CO. (Harry Varley BARKER and Percy Stanley CLARK, magneto repairers, 51, Hardman Street, Manchester, by mutual consent as from March 1st, 1929. Debts received and paid by H. V. Barker, who will continue the business.

Bankruptcy Proceedings.

COUNTY ELECTRICAL AND WIRELESS STORES, LTD., Garrick Yard, St. Martin's Lane, London, W.C. The statutory meetings in the compulsory liquidation of this company were held last week at the Board of Trade Offices, 33, Carey Street, W.C. The Official Receiver said the company was registered as a private one in July, 1923, with a nominal capital of £1 000, subsequently increased to £7 000. The issued capital was £1 000, all of which was issued for cash and fully paid up. Shortly after its inception, the company was appointed agents to retail "Burndept" products in the East Kent Area, and business was first started in July, 1923, at premises at Deal. Subsequently branches were opened at Folkestone, Bournemouth, Gloucester, and Hythe. Although in the first few months of the company's trading it restricted its sales to Burndept products, it gradually traded in other makes of wireless sets, and at Deal some business was done in house electric light wiring. By February, 1927, the company had become indebted to Burndept Wireless, Ltd. (a company formed in March, 1925, to take over the business of Burndept, Ltd., then in voluntary liquidation) to the extent of £6 998 in respect of moneys advanced and goods supplied. On February 17th, 1927, a debenture constituting a floating charge upon the whole of the assets of the company was created and issued to Burndept Wireless, Ltd., as security for the indebtedness. In June, 1927, Burndept Wireless, Ltd., agreed to accept a sum of £1,250 in full discharge of the company's indebtedness; an overdraft to this limit was obtained from the company's bankers, and the Burndept debt was paid off and the debenture was satisfied. Afterwards the company purchased the bulk of its supplies from another firm. The results of the company's trading from its inception to the date of the winding-up order (5 years and 6½ months) were as follows:—Sales, £36 499; gross profit, £7 130; overhead expenses, £18 326; net loss £10 691. It therefore cost £18 326 to make a gross profit of £7 130. Towards the end of 1928, the company became very badly hampered for want of working capital, but no means were found of providing this, and, in consequence, there was a marked falling off in the amount of the company's business. The liabilities of the company at the date of the winding-up, were approximately £4 319, and the assets were valued at £614. The Official Receiver had given up possession of the various premises occupied by the company. At the date of the winding-up, the directors were Messrs. H. S. Prince, A. W. Hambling, and J. H. Monins.

LONGE, John Martin, late of Queen's Gardens, Lancaster Gate, London, W. The affairs of this debtor, formerly interested in the lamp and electrical lamp industries, who was adjudged a bankrupt in May, 1926, with ranking liabilities estimated at £8 866, came before Mr. Registrar Francke in the London Bankruptcy Court on March 15th on the hearing of his application for an order of discharge. The Official Receiver said that, according to the report of the trustee in bankruptcy, there was a total realisation from the estate of £190, and it was estimated that a dividend of 3d. in the £ would be paid. In July, 1920, the debtor began business in partnership with two other persons as electrical lamp manufacturers in Woodchester Street, Harrow Road, W., where they traded under the style of the Eclat Electric Lamp Co. He was only a sleeping partner and estimated that he had sustained a loss of £7 000. In January, 1923, the debtor bought the Spencer Lamp Works, Spencer Hill Road, Wimbledon, for £8 000, of which £2 000 was paid in cash, £6 000 remaining on mortgage. The purchase price included the Standard Lamp Works, and he carried on those undertakings under management until July, 1923, when they were taken over by a company called the Eclat Electric Manufacturing Co., Ltd., which he registered. He became a director, and a year later obtained for the company of loan of £11 000 from bankers against securities worth £9 000 and against the guarantee for £3 000 of the petitioning creditor. Early in 1925 the first debenture holder appointed a receiver, and the second debentures had produced nothing. Towards the end of 1925, in order to discharge the loan of £11 000, his securities were sold and the petitioning creditor was called on to pay a certain amount under his guarantee. The debtor had failed to fulfil his own guarantee to the petitioner and the proceedings in bankruptcy ensued. In September, 1923, he had registered and become a director of the Eclat Electrical Accessories (Paddington) Co., Ltd., but this company also proved unsuccessful and a receiver had been appointed, the company at the date of his failure being moribund. The debtor attributed his insolvency to liability under guarantee to the petitioning creditor and to the failure of two of the companies. The discharge was granted subject to the nominal suspension of four weeks.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

305 330 PRITCHETT AND GOLD and E.P.S. Co., LTD., and C. R. D. PRITCHETT. Gas vents for electric accumulators. (16/12/27.)
305 332 J. A. CRABTREE. Fixed contacts for electric tumbler switches. (17/12/27.)
305 335 H. E. BUCKLEN. Battery charging systems and control relays and circuits for use in such systems. (19/12/27.)
305 345 T. YAMANOUCHI. T-shaped joint for electric cables. (29/12/27.)
305 348 A. MCKELLAR. Electric globe holders. (31/12/27.)
282 838 INTERNATIONAL GENERAL ELECTRIC CO., INC. Selcetive relays, particularly for electric protective systems. (31/12/26.)
305 354 CONSULTING AND RADIO SERVICE, LTD., and N. TURNER. Carrier arms for electrical pick-up devices for sound-producing machines. (10/1/28.)
287 079 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (14/3/27.)
305 356 D. R. DAVIES and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Electrical switchgear. (12/1/28.)
284 285 H. J. KUCHENMEISTER. Means for regulating the strength of sound in photo-electric reproduction from sound films. (27/1/27.)
284 356 ELEKTROMEKANO AKTIESELSKABET. Detection of variations in the frequency of high-frequency oscillations. (28/1/27.)
305 388 E. F. RUSS. Induction furnace. (2/3/28.)
305 393 W. FRENSDORFF and DEUTSCHE SCHIFF- UND MASCHINENBAU AKT.-GES Electric supply and distribution systems. (9/3/28.)
296 397 SIEMENS AND HALSKE AKT.-GES. Arrangement for the automatic regulation of the efficiency of transmission systems, particularly of high-frequency transmission systems. (31/8/27.)
292 942 J. SOUSEDIK. Single and multi-phase commutator motors. (27/6/27.)
305 420 G. RICHARDSON. Heat-operated electric switch. (3/5/28.)
290 226 INTERNATIONAL GENERAL ELECTRIC CO., INC. Electric drives for paper machines. (10/5/27.)
303 823 A. POUCHAIN. Negative electrode for zinc electric accumulators. (10/1/28.)
303 824 A. POUCHAIN. Lead electrode for electric accumulators. (10/1/28.)
291 376 P. F. HELLERMAN. Grip for electric cables. (31/5/27.)
305 428 F. WHIPP and WHIPP AND BOURNE, LTD. Electric fuses. (8/6/28.)
305 429 M. TROUTON and WIRELESS MUSIC, LTD. Electrically operated vibratory devices such as are used in the recording or reproduction of sound. (30/1/28.)
294 982 METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Vacuum pumping apparatus. (3/8/27.)
301 014 FALK, STADELMANN AND CO., LTD. Filaments for electric incandescent lamps. (23/11/27.)
295 281 BRITISH THOMSON-HOUSTON CO., LTD. Joining of sheet metal by electric welding. (8/8/27.)
296 678 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Radio and the like receivers. (1/9/27.)
305 447 S. T. QUILLIAM. Boxes or containers of mechanism for electrically operating tramway or railway points, switches, and the like. (11/10/28.)
300 902 F. CONRAD. Electric clocks. (17/3/27.)
275 264 MAATSCHAPPIJ TOT VERVAARDIGING VAN SNIJMACHINES VOLGENS VAN BERKEL'S PATENT. Alternating current motors. (30/7/26.)
283 490 R. BOSCH AKT.-GES. Electric storage batteries. (11/1/27.)
305 600 H. F. ELLIOTT. Tuning system for electric circuits carrying high-frequency currents. (6/8/27.)
305 680 J. BACSA. Alkaline accumulators. (8/8/27.)
305 683 M. Y. A. SERRUYS. Manufacture of inductance coils and the like. (9/8/27.)
305 508 P. R. COURSEY and DUBILIER CONDENSER CO. (1925), LTD. Means for the production of high frequency currents. (30/8/27.)
305 687 BRITISH THOMSON-HOUSTON CO., LTD., H. S. PETCH and F. J. LANE. Electric protective arrangements. (8/10/27.)
305 283 J. B. TAUNTON. Lamp-holders for electric lamps. (25/7/28.)
305 600 HOTPOINT ELECTRIC APPLIANCE CO., LTD., and W. J. SIMS. Electric heating devices. (1/11/27.)
305 691 STANDARD TELEPHONES AND CABLES, LTD. (L. POLINKOWSKY). Telephone systems. (2/11/27.)
305 515 E. W. JODREY. Manufacture of electrical condensers and materials therefor. (3/11/27.)
281 249 PATENT-TREUHAND GES. FUR ELEKTRISCHE GLUHLAMPEN. Method of producing a ceramic compound which is moulded by casting in a hot state. (26/11/26.)
305 612 J. STONE AND CO., LTD., and A. A. MEAD. Dynamo electric machines. (8/11/27.)
305 618 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and W. O. PASSMORE. Telephone systems. (8/11/27.)
305 696 A. REYROLLE AND CO., LTD., and B. H. LEESON. Electric protective systems. (9/11/27.)

3 350 G. H. BUCKLE. Automatic ignition control.
3 310 FERRANTI, LTD., S. Z. DE FERRANTI, and J. H. WHIBLEY. Static transformers.
3 336 E. FORETAY. Electric gramophone. (31/1/28, Switzerland.)
3 280 GENERAL ELECTRIC CO., LTD., and R. GUMM. Manufacture of electric heating apparatus.
3 282 F. P. LAMPARD and C. ROBINSON. Method of suppressing echo effects in telephone circuits.
3 244 C. R. MATTHEWS and S. S. WRIGHTSON. Insulation of railway, etc., rails.

COMING EVENTS.

Friday, March 22nd.

ENGINEERING AND SCIENTIFIC CLUB, WOLVERHAMPTON.—Paper on "The History of the Foundry Industry in the Midlands," by Mr. J. H. Wood.

INSTITUTION OF ELECTRICAL ENGINEERS (SOUTH MIDLAND STUDENTS' SECTION).—Grand Hotel, Birmingham. Joint meeting with Civil and Mechanical Engineers.

PHYSICAL SOCIETY.—Imperial College of Science, Imperial Institute Road, South Kensington. Annual general meeting. Presidential address by Dr. W. H. Eccles, F.R.S. 5 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-EASTERN CENTRE, STUDENTS' SECTION).—Armstrong College, Newcastle-upon-Tyne. Lecture by Mr. E. S. Evans. 7.15 *p.m.*

ROYAL INSTITUTION.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford, F.R.S., on "Penetrating Radiations." 9 *p.m.*

Saturday, March 23rd.

ROYAL INSTITUTION OF GREAT BRITAIN.—21, Albemarle Street, London, W.1. Paper on "Molecular Motions in Rarefied Gases," by Sir E. Rutherford, F.R.S.

PAISLEY ASSOCIATION OF ELECTRICAL ENGINEERS.—Visit to Messrs. The Clyde Valley Electrical Power Company's hydro-electric power station at Bonnington, Falls of Clyde. 3 *p.m.*

ASSOCIATION OF MINING ELECTRICAL ENGINEERS.—South Wales Institute of Engineers, Park Place, Cardiff. Paper by Mr. C. L. James on "Power Factor: Its Cause and Effect." 6 *p.m.*

Monday, March 25th.

ELECTRICAL CONTRACTORS' ASSOCIATION (EALING SUB-BRANCH).—Ordinary meeting.

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-EASTERN CENTRE).—Paper by Sir Charles A. Parsons and Mr. J. Rosen on "Direct Generation of a.c. at High Voltages."

INSTITUTION OF ELECTRICAL ENGINEERS (SOUTH MIDLAND CENTRE).—Paper on "The Construction of the Grid Transmission System in Great Britain," by Messrs. Johnstone and C. W. Marshall.

ELECTRICAL CONTRACTORS' ASSOCIATION (EALING SUB-BRANCH).—Ordinary meeting.

INSTITUTION OF ELECTRICAL ENGINEERS (SCOTTISH CENTRE, STUDENTS' SECTION).—Heriot-Watt College, Edinburgh. Paper by Mr. R. C. Henniker on "Static Transformer Testing." 7.15 *p.m.*

Tuesday, March 26th.

ELECTRICAL CONTRACTORS' ASSOCIATION (CHESTERFIELD SUB-BRANCH).—Falcon Cafe. Ordinary Meeting.

ELECTRICAL POWER ENGINEERS' ASSOCIATION (LONDON LOCAL GROUP).—Paper on "Foundations," by Mr. J. C. Hughes.

INSTITUTION OF ELECTRICAL ENGINEERS (SOUTH MIDLANDS, STUDENTS' SECTION).—Visit to works of the Midland Electric Manufacturing Co., Ltd.

POLYTECHNIC SCHOOL OF ELECTRICAL ENGINEERING.—307-309, Regent Street, London, W.1. Lecture (VIII (course of eight lectures) by Mr. E. S. Ritter, on "Picture Telegraphy."

ELECTRICAL CONTRACTORS' ASSOCIATION (CHESTERFIELD SUB-BRANCH).—Falcon Cafe, Chesterfield. Ordinary meeting.

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH MIDLAND CENTRE).—Paper by Mr. B. L. Goodlet on "The Testing of Porcelain Insulators. 7 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-WESTERN CENTRE, STUDENTS' SECTION).—Engineers' Club, Albert Square, Manchester. Paper on "High Tension d.c. Transmission," by Mr. F. Roberts. 7.15 *p.m.*

Wednesday, March 27th.

ELECTRICAL CONTRACTORS' ASSOCIATION (CROYDON SUB-BRANCH).—Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION (BELFAST BRANCH).—5, Bedford Street, Belfast. Ordinary meeting. 3.30 *p.m.*

EASTER HOLIDAYS.

The editorial, publishing and advertising offices of "The Electrician" will be closed for the Easter holidays from 6 p.m. on Thursday, March 28th, to 9 a.m. on Tuesday, April 2nd.

Current Topics.

Spring Trade.

ALTHOUGH the electrical industry is less dependent upon the seasons for its trade than many, it can take advantage of some seasonal tendencies to expand business at certain times in the year. It should be unaffected by the slackness of the "holiday" season and should use other seasons to increase the normal sales peaks. The application of this notion to the campaign activities of the E.D.A. is already proving its utility. We therefore make no apology for producing this week a special Spring Trade Number. We can point to no new fashions; there are no special Spring-time colours for flexibles or new shapes for lamps—though price changes are the subject of strong rumour—but we can and do point out that this is the most propitious time of the year for the manifestation of special selling activity in regard to domestic electrical appliances. At no other time of the year is there such a keen general desire for refurnishing the home. Our job is to make it known that electricity can be of help to all in furthering those laudable aspirations. Even if we ourselves are no longer victims of the annual upheaval of Spring cleaning the remembrance of our sufferings in the unenlightened past should have sufficient poignancy to imbue us with the missionary's zeal for converts. The surprisingly small percentage of electricity consumers possessing electric suction cleaners suggests, however, that we have not tried very hard to pass on the good news that Spring cleaning is an anachronism in the Electrical Age. Every lighting consumer is a prospective buyer of a suction cleaner. Too many of us have allowed ourselves to be frightened off this fruitful field by the notorious activities of the house-to-house canvassers, but there are openings to-day for the sale of thousands of cleaners, and they can be sold fairly easily, and without any of the stunt salesmanship adopted by the "commission only" type of salesman.

The approach of lighter evenings hardly seems to suggest public interest in lighting fittings, but the bright sunny days draw attention to shabby specimens, and suggest replacement by something which may be decorative by day as well as by night. Again the advent of warmer weather makes the keenest coal-fire adherents reluctant to light the fire just for an hour or two in the evening. This reluctance can be overcome in many cases by the offer of one of the smaller types of electric fire. And so we may go on through the range of domestic aids—not forgetting refrigerators and fans—all potentially good sellers in the Spring. There are yet possibilities in the domestic field just now. Let us take them while we may.

Capital for Telephone Development

IN casting about for profitable commercial schemes tending to reduce unemployment, successive Governments have been singularly blind to the claims of the telephone industry. Technically, the telephone system of this country is altogether admirable, but on the business side the curbing effect of the Treasury has been the major anti-progressive factor. Despite the existence of an almost unlimited field for profitable expansion of the service, it has been left to an association of British manufacturers of telephone plant and accessories—the Telephone Development Association—to take on the necessary work of development. Their work during the last four and a half years has clearly indicated the potentialities of a long-sighted programme of development, and it has also indicated, as Sir ALEXANDER ROGER pointed out, in his speech at Monday's annual meeting of the Association, that progress is definitely held up through lack of capital for investment in badly needed extensions. Although the present Government programme envisages an investment in this direction of £10 000 000 a year until 1931, the T.D.A. emphatically holds the view that this is not nearly enough, and that something more than £100 000 000 could profitably be invested during the next seven years. It is, as Sir ALEXANDER said, a negative of international effort for us to rest content with a situation in which facilities exist for the spoken word to be transported from San Francisco to the Atlantic coast of America, thence by wireless—soon by submarine cable—to these islands, only to find on arrival here that only just over 3½ per cent. of our population have the necessary telephone in their home or office to receive it.

A Deserving Appeal.

IN connection with the centenary commemoration this year of the establishment of King's College, University of London, an appeal is being made for £350 000 to meet requirements for buildings and endowments. The College is now, with the approval of the Senate, acquiring a 200 years' lease of an area of nearly 5 000 sq. ft. above the

Digitized by Google

Aldwych station, and plans have been prepared for the erection on this area of a new building to accommodate several departments which are now inadequately housed. The attention of our readers is drawn to the special arrangements which are being made to secure endowments for the Chair of Physics, now occupied by Prof. E. V. APPLETON, F.R.S., and the Chair of Electrical Engineering which, since the untimely death of Prof. J. HOPKINSON, F.R.S., in 1898, has been held by Prof. ERNEST WILSON. The discoveries and inventions which have been made in the laboratories of the College, the promise of new developments contained in the original investigations which are now being carried on, and the continuous supply of personnel trained in these two departments, are of immense value to the electrical and allied industries, and it is hoped that the firms to whose benefit the College contributes in so many ways will generously help to place the two chairs in the position of dignity and financial security which their importance deserves. During the past hundred years the departments of physics and electrical engineering in King's College have rendered valuable services to the electrical and allied industries, and to-day the two departments are regularly supplying trained workers to meet the demands of modern industry. In addition to their work of teaching, all members of the staff are actively engaged in the prosecution of research. For example, in the Wheatstone Laboratories, under the general supervision of Prof. O. W. RICHARDSON and Prof. E. V. APPLETON, work is proceeding on wireless wave propagation, investigations on soft X-rays, and generation of electrical oscillations by gas discharges; while similar investigations are being carried on in the Siemens Electrical Laboratory, under Prof. WILSON.

American Views on British Electrical Industry.

To see ourselves as others see us is one of the processes which, when applied to the electrical industry, are always of interest. From a recent "Commerce Report" of American origin we learn of the electrical industry in England that "shipments both on industrial and public supply account have barely kept level with the totals of 1927." . . . For almost a year exports have, according to the same report, declined steadily, but, we are pleased to note, the movement has come to an end. On export account, therefore, the outlook is given as "still hopeful" and "there may be sufficient turnover to keep the factories employed without yielding any real surplus for the financing of important contracts in the future." These views on the position of the British electrical industry are based on one of the B.E.A.M.A. trade reports, which is sufficient reason for pointing out the harm which the broadcasting of pessimistic reports may sometimes cause. If America believes the electrical industry of this country to be barely keeping its head above water, there must be others with similar views. These remarks are all the more remarkable when it is remembered that the total value of American electrical exports from January to November of last year (the latest available) amounted to £20 000 000 against the British total of £16 895 185 for the same period, figures which show that the condition of the American electrical industry cannot, after all, be very different from that of our own.

The B.E.A.M.A. Report.

IN contrast with some of the publications of its Economic and Statistical Department, the annual report of the council of the British Electrical and Allied Manufacturers' Association for the year 1928 takes a more hopeful view of the trade situation. It points out that, while the trade depression of last year naturally affected the electrical industry, electrical production in 1928 was in advance of that of 1927, and that, while at one time Britain had lost ground in international competition, the electrical orders secured towards the end of the year were calculated to restore the state of balance existing in 1927. An unsatisfactory feature of the export situation was the smaller volume of orders placed by the Dominions, with the possible exception of India, but an improvement is expected in the current year. On the other hand, in neutral markets, such as Europe and South America, the British position was improved, and there are indications that, during 1929, the extension of the curve of progress will be upwards.

Talking Films.

THE announcement on Monday by Mr. WINFIELD SHEEHAN, vice-president and production manager of the Fox Films Corporation, that his company will never make another silent motion picture but will produce only dialogue and musical pictures, is not without interest to the electrical industry. The "movies" have for a long time absorbed a considerable amount of electrical equipment in the way of lighting apparatus, and now that the "talkie" is becoming established even greater opportunities are at hand. From the electrical point of view the talking film possesses the advantage that not only is all the lighting equipment of the silent picture necessary to its production but extensive sound recording and reproducing apparatus is also necessary. So important does this side of the film industry appear to be that last week no fewer than eight companies signed an agreement with the A.E.G. and Siemens and Halske providing for the exchange of over 500 patents for the manufacture of talking films. Films of this type so far exhibited in this country have been of American origin, the reproducing apparatus being of Western Electric manufacture, and, though the majority of the halls where the films are shown were designed without regard to acoustics, the results have, on the whole, been remarkably good. At this stage of development each film is hired with the reproducing equipment, but doubtless in time such apparatus will be as much a permanent fitting of every cinema as is the projector itself. The manufacture of sound reproducing apparatus is for the most part in the hands of the big wireless manufacturing firms, many of whom have merged with gramophone organisations. The latter are also well versed in the electrical recording of sound on their own account, and with the Radio Corporation of America and the Victor Talking Machine Co., and the Marconiphone Co. and the Gramophone Co. all pursuing the same objective, it is fairly safe to say that the talking end of the "talkie" is well on its way to perfection. The gramophone industry long ago attracted many radio engineers to its laboratories, and, unless we are very much mistaken, other men of the electrical calling will find their way to Elstree and Hollywood, to put the talking film on the same technical plane as the gramophone.

A Fool-Proof Charger Wanted.

THE increasing use of home chargers for wireless accumulators makes the necessity for fool-proof designs all the more important. The majority of the a.c. rectifier types on the market incorporate a 2-electrode valve with automatic resistance balance for 2, 4 or 6 V accumulators, thus requiring of the user no more technical skill than is necessary to connect up the positive and negative output leads to the battery, and to plug the device into the supply circuit. On the face of things, this arrangement looks fool-proof so long as the polarities of the output circuit are observed. We thought so, too, but a case has come to our knowledge where the wall plug accommodating the charger was wanted for a bowl fire, with the result that the charger plug was removed and the fire plugged in circuit. This, too, appears simple enough, but, with the output of the charger still connected across the accumulator, the latter was shorted for several hours. This simple case once more points to the necessity for manufacturers to make domestic electrical appliances in such a way that every oversight due to the ignorance of the user is anticipated, failing which definite instructions should be given with each apparatus sold. In the case of industrial equipment every precaution is taken to prevent error by ignorance. Why, then, should the domestic user of electrical appliances be assumed to be *au fait* with the shortcomings of such things as chargers? Further, why should not the apparatus be made really fool-proof?

MORE ELECTRICAL PENETRATIONS.

A "Muck-Shifter's" Unconventional Views on Electricity for Civil Engineers and Public Works Construction—Opportunities for Electrical Industry.

By WARWICK HOLMES.

IT was a lean and bronzed friend returned from Nile irrigation and dam construction who first made me think of further electrifying heavy outdoor engineering operations. He was an open-air civil engineer—a type beloved of certain novelists. Modesty made him describe himself as a "muck-shifter"; for the purpose of this story we will call him by the more euphonious title of Mark Shuter.

Before showing the various and many directions in which electrification of contractors and civil engineers' constructions can expedite work and reduce costs, certain fundamentals about these primal branches of engineering have to be faced. Why are public works contractors so often discovered with steam-driven cranes, dredgers and pile drivers? Why are their burdens navvy-borne; the timbering for excavations sawn with sweat and muscle? Why are hands literally at the pumps; why compressors oil-engine driven; why does the wheel-barrow persist?

Shuter, who had more time for contemplation in open spaces than journalists and power station engineers who cramp their brains thinking of the next edition or the agenda for Monday's meeting, had asked himself these questions. His reply involved fundamental considerations. "Before we can think of words like civilisation, city, industry, or electricity supply we must be able to see harbours, docks, roads and water works," said Shuter. All of those things in a new country come before an electricity supply. It may be assumed generally that the builder of bridges and tunnels, the drainers of watersheds, those who dam and sap, blast and bore—in a word the big Mark Shuters of the world—have been accustomed to think and act without much electric power entering into their calculations or their works. As a result the spade has as yet only become a steam shovel; horseflesh hauls the rough burdens of brick and ballast; men, men, and more men, toil with lever and picks; they haul at chains, and are bent with buckets.

An electrically-driven air compressor for road drill operation. The connection to trolley wire should be noted.

"Here," said Shuter, "in these highly electrified islands of Great Britain there can be no excuse for un-electrical methods of performing great works: clearly, more creative salesmanship is wanted." More getting together is needed between civil and electrical engineers. Some time back I showed in THE ELECTRICIAN how the building industry could benefit by electricity behind hod, trowel, crane and every manner of smaller tool. I was told the article caused a "stir." Good. The unelectrified condition of the sheltered building industry, I insist, is nothing compared with the horse-flesh-coal-and-boiler state of the old generation of Mark Shuters.

Lest it might be thought that what I am saying is an exaggeration, regard, please, the works which are carried out either by or for "men-who-should-know-better." Take, for example, the making of roads. If new arterial roads are to be driven across country, there may be some excuse for using a preponderance of horseflesh and oil engines. There may, indeed, be considerable distances to be traversed to make cable connection to a supply; landowners of intervening property may be those perfect sportsmen who think of their partridges first, and lastly of their country's need for better communications. In Italy I remember watching, on a hot summer's day, road constructors on new works erecting temporary trolley wires. I marvelled. These were to be used for supply to narrow gauge electric locomotives for tip wagonhaulage. Electric motors connected to those extempore power services were eventually used for power-shovel working, for ballast grinding, for sieving, for concrete mixing and for compressor operation. An amateur cinematograph film which I made enthusiastically of the excavations of a recently completed London building shows the maximum electrification of contractor work, but petrol locomotives used for tip-wagon haulage. The pity of it.

Where road construction operations are contemplated within a city there seems no excuse whatever for ignoring the economic and convenience factors of electric power. That this development is already well "tooled-up," as they say in Coventry, is evident from the successful operations of an all-electric rail laying and roadway maintenance plant devised by the London United Tramways. A heartening description of this equipment forms the subject of a later paragraph.

Tardiness to adopt electric power for urban road construction is evidently due to the same difficulty as that faced by building contractors: namely, entreating a supply company to bring precious cables into a horrid site where no building as yet exists. In the case of road construction and repair operations, particularly where tramway system section and feeder pillars are to be found at regular intervals along the side walks, obtaining an electricity supply should surely be easy. Why not design section pillars with provision for some spare feeder circuits? These could be connected when required, by plugs and cab-tyre twin to the motors of mechanically operated road making plant. Meters would be provided within the feeder pillars so that contractor could be charged for the current consumed. In streets with no feeder or section pillars, why not meters and feeder sockets in the under-pavement inspection chambers generally used for housing junction and fuse boxes?

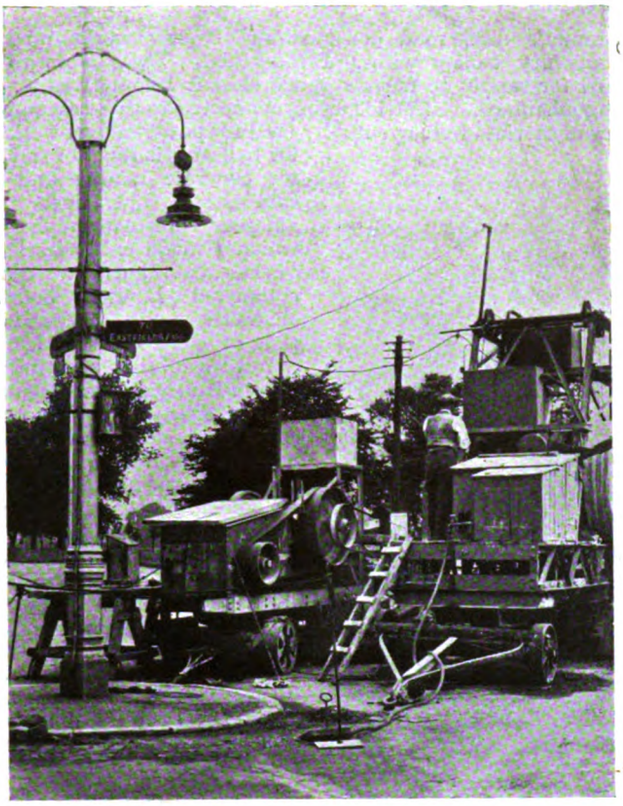
The idea is not without parallel in the provision of temporary water services for builders and contractors. By application to a local water authority, I assure you, a stand-pipe can be provided in an under-road hydrant-box near the site. Metered water is thus supplied and charged for. Why should similar facilities be denied the would-be user of electric energy? Where roads are maintained by direct labour under control of a city or borough civil engineer, and the electricity supply is a municipal undertaking, the expense of selling current should be virtually nil. Internal book-keeping between one department and another of the same borough is all that would be required. Very low rates for power would thus be possible.

Emergency night work would be a glad business by provision of temporary electric lighting. The latter would provide incomparably better illumination than acetylene flares. Hoarding and barrier lights—generally depressing oil things—could be electric and cheerful. Pitch and asphalt could be melted electrically. Think of the customary daylight coal-fired, smoke-belching peripatetic boiler—an eyesore and an olfactory affront. Why tolerate it?

A very bright spot in the use of electric power is the successful

Digitized by Google

operation of an all-electric rail-laying and roadway maintenance plant devised by the London United Tramways. Some of the photographs which illustrate this article show a four-man pneumatic drill, and a composite plant which comprises ballast crusher, belt conveyor and concrete mixer.



A road making plant with electricity and water "on tap."

The latter plant is shown conducting various operations. We see stone crushing, and delivery of concrete from mixer to tip-wagon. All operations are electrical, except power for the latter, which is from a petrol engine. A battery driven truck would have pleased me better.

Laying Pipe Cables.

Among "the-men-who-ought-to-know-better" class are, of course, the supply companies themselves. It is no uncommon event, where new cables have to be drawn into ducts in a city, to see this performed entirely by unaided human beings. A few months ago in a town of 500 000 population, I witnessed no fewer than twelve men manning a cable and drum. The spectacle was more like a "turn" from a military tournament than a serious industrial operation. The rate of movement of the cable was about 1 foot per minute, so that the man power cost for drawing in 100 yards of cable was approximately £5 10s. In the face of this there must be a lot to be said for power-operated winches.

The Commonwealth Edison Co., in addition to a fleet of electric lorries of all sorts of shapes and capacities, have a number of special cable-laying vehicles. Like all the transport fleet of this undertaking, these are electric battery vehicles, but are specially equipped with electric motor-operated winches for hauling cables into ducts and subways. Battery trucks, which are used for towing two-wheeled lever-loading cable trailers in New York and Chicago, facilitate drum manoeuvring in city streets. But, then, in England it is the exception to find supply companies who believe in electric vehicles, so I suppose the hope for power-operated cable laying is very remote—and petrol dearer, too.

The Holborn explosion, apart from revealing undreamed-of antiquity and methodless pipe and cable-laying of public utility services, discloses universal antipathy to labour saving tools. Lighting in the cable trenches and sewer cuttings is by portable acetylene flares, and even by naphtha torches. Think of it in 1929! Beyond the use of pneumatic picks for concrete breaking, no power operated tools are used. The compressors are oil-engine-driven; hoists and lifting tackle are man-handled. There is not a temporary cable service in the whole of the devastation. The sight of a man sitting astride a 4 ft. water main reducing its length by 3 ft. assisted only by hammer and chisel, would be laughable were it not for the egregious time waste which the traffic diversion entails. If new lengths of cast iron water main *must* be cut on site, why not a portable carborundum wheel—high speed and electrically driven?

The Power Age.

For some years Shuter has collected from engineering papers cuttings relating to electrically-operated plant and tools for civil engineers. From the infrequent use of such appliances by civil engineers and contractors in England, one would say that great days are ahead. Electric welding has progressed so far in the United States that a year ago, on the line of the Boston and Maine Railway at Chicopee, Massachusetts, there was commenced an electric arc-welded, rivetless steel railway bridge. The latter is virtually a one-piece structure. Every joint has been welded solid and immovable. Forty tons of steel were saved by avoiding the conventional riveted design.

A French firm of contractors' engineers supply portable electrically-driven ballast grading machines. A Boston firm of cable makers specialise in cables for use "out where the going is rough," that is, for services to power shovels and quarry compressors. A Duisburg firm makes electric power shovels of 25-ton lifting capacity. The Arrol-Whitaker electric navvy from Glasgow is well known, also the same firm's rotary tunnelling machines adapted for electric drive.

A Leipzig firm recently completed an electrically-operated reservoir-excavating machine having an operating radius in one location of 260 yards. The capacities of the drag line buckets on this machine are 7 cu. yd. each. Machines like these can literally move mountains. If you want to bore vertical holes in the earth for pole erection there is an earth drill adapted for oil-engine or electric drive which will bore 6 ft. in 3 minutes. It can be purchased in London, and is very largely used in America. For overhead line erectors it should be "just the thing."

Building Docks and Harbours.

There are merchandisers of electrical energy, generally described by writers in electrical trade papers as "supply engineers," who think too little of the harbours and estuaries that are the big doorways to cities. In an effort to alleviate sudden rush of domestic electricity to the head, a N.E.L.A. bulletin writer once reminded readers that one medium-sized electric vehicle, such as a supply undertaking might use for local delivery purposes, provided a load exactly equivalent to that of seventeen hundred electric flat irons. There are some who are like that about their docks and harbours.

In shrimping for the load provided by electric haircurlers and shaving mugs, it is conceivable that energy merchandisers are missing the big fish—yes, the Mark Shuters—which nets cast in deeper waters would catch. New docks built in England require for their construction the same tools and plant as docks built anywhere else in the world. I recollect, nevertheless, being jealous of the electrical equipment of harbour contractors in Rotterdam, Hamburg and Copenhagen. A letter addressed to twenty large British civil engineering contractors.

An electric crusher, conveyor and mixer on road construction work.

when I began to think more about the subject of this article a few months ago, asked the question: "Is it your opinion that the further use of electric power would facilitate and cheapen the constructions of public works contractors?" The replies ranged from the type which misunderstood the question to bald statements of the "we are not interested"

Digitized by Google

kind, and "requisitions for new plant are not due till the blank date, and should be addressed to our office at blank."

In contrast with steam-operated quaywall cranes, and excavators, pile drivers, pumps and locomotives, which are a common sight in hours spent on a pilot's tender, or familiar to one who scans from his ship the banks of British estuaries, many Continental and American harbours were built into a full tide of electrical energy behind pick and sledge. That they are operated electrically goes without saying. Lest I am misunderstood, please let it be said that most of the harbour authorities in Great Britain are very wise users of electrical energy.

Friends from San Francisco who last "fall" joined me in a midnight tour of certain important London dock improvements, were interested in extraction from the clay bed of 30 ft. steel piling with the aid of an American tool. All the cranes, of course, were steam driven, and some of the lighting was by acetylene flares. Picturesque, we called it.

Canals and Electricity.

Recent amalgamations of canal and inland waterway interests persuaded me that there is yet a chance to save these navigations and provide cheap transport for fuel, minerals and building material. Mark Shuter, to whom I referred the subject, believes in electrification of canals, and replacement of the towpath barge dobbin. Others, too, have dreamed of towpaths installed with permanent way, trolley wire and electric tractor, barge masters paying ton-mile towing rates to a navigation authority. The chains of locks, for example those near Devizes, inevitably imposed by land contour and gradient, incur heavy maintenance costs. They reduce grievously overall average speeds of canal-borne freights, so that hard-boiled men have leant back in their Berkeleys, and said: "Canals, Mr. Shuter, are for flat countries—Holland and so on."

That this is nonsense must be manifest to anyone who takes the trouble to graze an acquaintance with current German canal practice. Here, again, an opportunity; thousands of milowatts directed by an aggressive and creative energy merchandiser must come to the aid of the civil engineer. Forgive me, but electric and electro-hydraulic barge hoists of hundreds of tons capacity and many metres of lift are well established accomplishments in certain Continental canal systems. Thereby are obviated the con- and ob-struction of locks and incalculable water wastage.

Powers have been granted for the building of more tube railway systems; further suburban railway electrifications are on the drawing board. Let electrical engineers remember, too, the canals; let them add to the volume of opinion which temperately advocates inland water communication; let them, by urging the use of electrical energy in their reconstruction and operation, paint the first bright picture in a discreditable history of British inland waterways.

In an earlier paragraph I have shown how electrical energy may easily and profitably be put into the hands of the Mark Shuters. Charges of pessimism and destructive criticism—the latter necessary for ground levelling purposes—are no doubt being formulated. I hope later to be acquitted.

Rapid tube travel is the greatest possible compliment to an electric age. The progressive contractors, who built the South London tube extensions, equipped electrically the whole of the shaft sinkings on station sites. Air compressors for picks and riveters, pumps for drainage and grouting, drills, hoists and tip-wagons—all were electric. I nearly lost my eardrums in the air-lock looking at it. One contractor, a friend of Shuter's, even set the good example of using a 3-ton electric battery vehicle for clay and shale shifting from excavations to dump. But every time last year when I went to Piccadilly Circus new station and escalator excavations, I found miners digging clay laboriously with hand spades. Think of it.

That bacon-frying aroma which assails the nostrils in certain London catacombs arises from cooking by gas rings for booking clerk and porter staffs. Ugh! Tunnels and permanent way are examined at night by portable acetylene lamps; paraffin is deemed the ideal illuminant for the signal and safety lamps of guards and conductors.

How Supply Companies Could Help.

Here, then, are some constructive suggestions which we must put into action at once. Every wise merchant knows that the progress of great industries is accelerated or retarded according to whether the sales policy for distribution of its contributory and consumable products is aggressive or static. The provision on civil engineering works of a portable electric cabin and office, by the electric undertaking with power to sell is most reasonable. All sorts of sub-contractors—the piling companies, the dredger operators, the bridge builders and others—have their offices; not so the electricity suppliers who might easily be the most important of all sub-contractors. What is wanted is an efficient switch, metering and distribution cabin. On a large site like the Ford Dagenham site, for example, where mammoth piling and drainage operation are demanded, several portable electric distributing chambers would be required. If power were transmitted to them at high pressure, they would need to incorporate transforming equipment. That would be easy.

It must, of course, be conceded that the present partially standardised condition of supply characteristics is some obstacle in the way of full utilisation of electric motors by public works contractors. Mark Shuter's American experiences of advantages arising from voltage standardisation brought an avalanche to my ears. I stemmed it with a just account of what the Commissioners and Central Electricity Board had done and were doing.

Sales resistance to purchasing that new plant which full electrification demands, could be overcome by a hire service agreement operated by supply authorities, or sub-let to officially appointed electrical sub-contractors. Believe me, the large number of big civil engineering works which are in hand by public works contractors at the present time, and the total of contracts involving enormous expenditures during the next five years, justify a brave perspective from electrical development personnel. Let them think. Those contracts justify the statement that there are millions of kilowatts of unconnected power load waiting for the supply undertaking who will follow the line of reasoning I, and no doubt others, have pursued. Let them at least take the trouble to investigate; Shuter is *on* friend.

BOOK REVIEW.

Excavating Machinery as Represented by Power Shovels, Drag Lines and Grabbing Cranes. By W. BARNES, M.I.Mech.E. (London: Ernest Benn, Ltd.). Pp. xvi+247. 42s. net.

Although excavating machinery is a comparatively recent development, both the applications and types of apparatus coming under this heading have grown at a remarkable rate. This practical and well-illustrated treatise deals with power shovels, drag lines and grabbing cranes, and in addition to constructive and relative data the author supplies valuable hints and working information for the prospective user. While the first steam shovel appeared in this country in 1840, it was not until 1899 that the Osgood Co. built the first electrically-operated shovel which had two motors, one of 25 H.P. for hoisting and swinging, and one of 15 H.P. for racking. The next, with a 60 H.P. d.c. motor by Scott and Mountain, of Newcastle, was constructed by Ruston, Proctor and Co., in 1902, but after these pioneer efforts progress was exceedingly slow. In fact, up to about 1914 only about 20 machines in all had been constructed by the various makers. In recent types, the Austin and the British Thomson-Houston variable voltage systems, with their lower power and maintenance costs and their ability to dispense with hoisting brakes and clutches with the attendant air compressor, are regarded as offering great possibilities for the future. The new "Eddystat" controller, made by Electric Control, Ltd., also appears to offer distinct possibilities on a.c. excavators. The electric shovel is particularly favoured in copper and iron ore mining, and the author provides interesting details of working costs and output in comparison with steam apparatus. In the Utah Copper Mine during seven months of 1926, during which period nearly nine million cubic yards of excavation were involved, it was ascertained that on a.c. shovels there was an average consumption of 0·494 kWh per cu. yd. of material excavated, the consumption on d.c. being 0·397 kWh. The d.c. machines also had a slightly larger output at 1 846 cu. yds. per shift of 8 hours, compared with 1 766 cu. yds. In a general comparison of daily working costs of a certain sized drag line excavator, the electrical machine ties with the crude oil engine machine at 105s., the costs rising to 140s. for a coal-fired steam machine, 145s. for a petrol-engine machine, 173s. for a petrol-electric machine, and 223s. for an oil-fired steam machine. The book should prove indispensable to those having to do with excavating machinery.

MAILING LISTS BUILD BIGGER BUSINESS.

Classifications Allowing Various Appeals to be Sent to Different Classes of Electricity Consumers—How the Electrical Contractor Can Link Up with National Advertising and Reap Personal Benefit from it.

By W. A. GIBSON MARTIN.

IT is not a difficult matter for the electrical contractor to compile a mailing list of users of current. In some cases the Corporation or supply company will supply a list of firms and private individuals to whom current is supplied. In others, the use of electricity is so usual to-day that any list of residents in good class districts would consist of from 90 to 95% users of electricity. The value of the mailing list is not so much the number of live names which it contains, but the manner in which the list is kept, and the method of using it to bring in business.

The only efficient way of keeping a mailing list is to have a card devoted to each name, and to have the cards kept in strict alphabetical order irrespective of the class of user, or whether the user is a private person or a business organisation. There is only one exception to this rule, made purely for the sake of convenience: prospective customers may be kept in one file and customers in a second file, but this convenience may be sacrificed if the double index does not save time. This classification may be obtained in another way, still keeping to one index for the whole mailing list.

There are two main groups of users, and these again are each divided into two subsidiary classes. The classifications may be indicated by coloured cards, or by coloured tabs fixed to each card, or by having the cards notched or cut away as is done in the case of guide cards in a vertical file. The diagram reproduced indicates how colours may be used as the basis of classification. As an aid to memory, it will be seen that light colours are used for the cards to indicate prospective customers and dark colours to enable an operator to pick out all customers.

In choosing colours for the latter, care must be taken to obtain cards which will show up writing distinctly; there are some dark blue and dark red cards offered by stationers which are far from satisfactory in this respect, and as it is necessary to read names and addresses quickly and accurately, there must be a test made of different colours of cards, not only when an entry is made, but a week or so after. If the name and particulars show up clearly immediately after writing, and again after the lapse of a day or more, the colour will be quite satisfactory. If there is any doubt about a colour when tested in this way, it is safer to adopt another and a lighter colour, to make certain of efficiency in addressing letters and envelopes.

CLASSIFICATION OF MAILING LIST.

	PRIVATE.		COMMERCIAL.	
CLASS.	PROSPECTS.	CUSTOMERS.	PROSPECTS.	CUSTOMERS.
Light	White cards	Buff cards	Light Blue cards	Medium Blue cards
Power	Yellow cards	Orange cards	Pink cards	Red cards

When a prospect becomes a customer, a new card of the proper colour is made out and any details transferred to the new card.

Linking Up.

National advertising is a form of publicity which occupies a large part of every electrical manufacturer's programme to-day, and so there is no need to convince people about the advantages of electricity as a luminant and for power. But the progressive contractor and the wide-awake retailer want to link up their own services as electrical experts with the national advertising of the manufacturers. As most manufacturers now favour "wide distribution" of their goods, the electrical contractor no longer enjoys the privileged position of a sole agency in his district. Thus, taking for example Mazram lamps, the electrical contractor must prove to the mailing list, not how good Mazram lamps are, but exactly *why* the people on the mailing list should buy Mazram lamps from him, and not from one of the hundreds of other dealers who carry stocks. The national advertising campaigns will sell Mazram lamps, but the general phrase, "obtainable from all electricians," must be replaced by educating the customer to think "Mazram." "Oh, yes; Brown's Electrical Stores in High Street sell Mazram lamps." That can only be done by telling the customer about the service which Brown's Electrical Stores can offer, and that although Mazram lamps can be bought in many different stores, there is only Brown's Stores which backs up the sale of lamps with service.

The electrical contractor is fortunate in dealing with a product which is recognised as essential for all modern buildings, but about which the average man is ignorant. Even the simple matter of replacing a fuse wire is an affair of mystery to the vast majority of those who use electric light every day of their lives. Thousands of the new houses built recently have electric light, and when the slightest fault develops there is a hurried telephone call for the electrician, and the man's travelling time is double or treble the time taken to rectify the trouble. It is unfair to expect people to pay for four hours of a man's time when the job only took half an hour, yet it is quite obvious that just as the man has to be paid for four hours, so has the firm of electrical contractors.

A Booklet Suggestion.

If, however, the electrical contractor has a booklet prepared, telling in simple language the elementary facts about electricity supply, showing in a clear way the purpose of the fuse box and exactly how a fuse wire should be put in; and if a booklet is illustrated to make these simple points easily understood, and has a few lengths of fuse wire enclosed in a pocket in the back cover; if this is done, then the customer is offered a service which lifts Brown's Electrical Stores from the rut in which all other stores are located, and shows the customer exactly *why* he should buy Mazram lamps—and every other type of electrical requirement—from Brown's.

It is, of course, easy to generalise; it is easy to talk about preparing a booklet, and about the fact that there are many people who do not understand the simplest facts in connection with electricity. But even large firms have to consider rather carefully before they indulge in expensive schemes of broadcasting a booklet to perhaps 10 000 or more users of current. Such a procedure might or might not be a success, and in all probability it would be too large an undertaking to carry through efficiently. It is possible to use the booklet to much better advantage by sending a letter to the mailing list, explaining that a man has sometimes to travel five or six miles to put right a very simple fault, and that with the object of avoiding expense to customers a booklet has been prepared explaining in a non-technical way how to keep an electrical system in order; the booklet will be sent to those who reply, using the post card enclosed.

By this means, the profitable use of the booklet is assured, the electrical contractors find out exactly which prospects are genuinely interested in electrical matters, and the cards in the mailing list can be marked accordingly. Follow-up letters and leaflets can be sent to these people from time to time, while they offer a useful way of using the over-printed advertising matter supplied by manufacturers.

A firm in New York desires to secure exclusive agencies for the United States of British manufacturers of electrical household and heating appliances, electric labour-saving devices, electric tools, machines or patented specialities used in the electrical hardware or automobile industries, lamp shades, lighting fixtures, illuminating signs, radio specialities, etc. Further information can be obtained from the Department of Overseas Trade. ARCHITECTURAL LIGHTING.*

How Effects are Obtained—Modifying Conceptions of Space—Luminous Surfaces—Some Notable Examples—Collaboration with Architects.

By WALDO MAITLAND (E L.M.A. Lighting Service Bureau).

THE chief characteristic of architectural lighting is the fact that it is built into the fabric of the building, and forms an integral part of the architecture.

Isolated examples of built-in lighting, such as cornice lighting or illumination from skylights, have been designed during the last ten to 15 years, but it was not until comparatively recently that this movement received general stimulus subsequent to the Paris Exhibition in 1925, from which the basis of architectural lighting, as we know it, took form.

Architectural lighting, incorporating the lighting units in the structure of the building, may be obtained from (*a*) panels in the ceiling; (*b*) panels in walls; (*c*) lighted columns; (*d*) lighted lintels; (*e*) cornice lighting.

In some instances the lighting effects are obtained by reflection from opaque surfaces—i.e., indirect lighting, while in other instances the light is obtained through translucent material, providing either semi-indirect or a direct form of illumination. In the former, the effect is achieved by reflection from white or coloured surfaces, while in the latter the quality and colour of the translucent material is important. The indirect method, however, inevitably suffers from the lack of vitality associated with this form of lighting, and, in general when employed, requires supplementary lighting methods to give complete satisfaction.

There is one important feature of these architectural methods of lighting which considerably assists the furtherance of good lighting—namely, that high intensities of illumination can be provided from light sources within the field of view which are of comparatively low brightness, and, in the best examples, any semblance of glare is avoided.

Another phase in architectural lighting is the use of light to modify the conception of space, and to give a sense of separation between one room and another; for example, by lighting the surfaces within the field of view in one room to a greater brightness than those in the adjoining room. Of course, a similar result is frequently obtained by the careful choice of colour schemes in adjoining rooms. An excellent example of this effect of separation produced by coloured lighting is to be seen at the Mayfair Hotel in a reception room and adjoining ballroom.

Architectural lighting is as yet in a very early stage of development, and some of the examples which I propose discussing only incorporate a little of this architectural lighting effect; while in others the lighted or luminous surfaces play a vital rôle in the character of the interior or exterior design of the building.

Interior Lighting.

LIGHTED CAPITALS.—An interesting effect has been obtained in some instances by lighting the caps of columns, and this method may be applied to provide general lighting in the interior when the columns are sufficiently close together. To be successful from an architectural point of view, the columns themselves have to be very carefully designed. Such a method of lighting has been introduced in the Accounts Section of the Shoreditch Electricity Showrooms, where lamps are introduced in the glassware at the capitals of the columns and elsewhere.

LIGHTED COLUMNS.—The illuminated columns on the ground floor of the main Berlin Electricity Showrooms form an interesting feature at the head of the stairway leading to the floor below. Although the columns are luminous, their position does not suggest that they are intended for supporting loads, and, hence, contrary to many examples of lighted columns, they do not convey the appearance of weakness. Wide metal bands form capitals to the columns, and these in turn are supported by subsidiary vertical and horizontal strips. Auxiliary lighting is provided from the upper portion of the frieze and the cornices, giving a general even brightness to the ceiling.

In other examples columns are built up from units of moulded lighting glassware on either side of doorways. This is a feature which can be incorporated when the main fabric of the building is completed.

In the following examples the lighting has become an integral part of the architectural design, and it is evident that the modelling of the room has been influenced by consideration of architectural lighting.

For instance, in the first class dining saloon on the "Ile de France," direct lighting is provided from the ceiling by 164 symmetrically arranged portholes, each housing a 300 W lamp and covered with thick yellow tinted glass. The strong lines of the room are not in any way hindered by the lighting system, but are, if anything, emphasised by the repetition of the lighting units, which are well placed in the ceiling and walls. The electrical consumption is 5½ W per sq. ft., and the lighting effect is that of brilliant sunlight.

An Interesting Effect.

In the first-class lounge on the same liner, the central portion of the ceiling is composed of squares, egg-shaped in section, and a lamp is placed at the apex of each. An interesting effect has been produced in this room by the introduction of a light fawn carpet below the central part of the ceiling. The furniture, too, is light in colour, so that, when brightly lighted from the ceiling, this portion of the room stands out in contrast to the surrounding carpet and furniture, which is carried out in dark browns and greens. Indirect cornice lighting illuminates the remaining parts of the ceiling, which, since it is textured, gives a rich decorative effect.

The Bar Bergère in Paris is an interesting example of interior lighting where the columns, ceilings, and counter are rendered luminous. The luminous surfaces assist in giving an atmosphere of gaiety.

In another instance, the main illumination is obtained from a recessed ceiling, the lamps being housed in coves, a warm and pleasing effect being obtained by the introduction of coloured lamps on various circuits.

The lighting of the Bar Chiquito, Paris, shows other interesting architectural lighting features. It is lighted by a luminous ceiling which is framed by a strong luminous band obtained from lamps placed in reflectors, housed above the broad dark frame of the ceiling. A large ovolo moulding, containing lamps, at the base of the ceiling, lights up the lower portion of the textured sides, and the gradation of brightness on the textured portion emphasises the lines on sloping sides.

Similar lighting methods can be applied to domestic interiors, and some excellent examples of modern domestic lighting were to be seen in the exhibition rooms at Waring and Gillows' recent Modern Art Exhibition.

In all examples of architectural lighting better results are achieved when the "architectural lighting" is supplemented by lighting details such as applied fittings.

I have, up to now, been dealing with purely architectural lighting as applied to interiors, but if logical methods of applications are evolved there is no reason why the lighting of building exteriors should not become a natural thing in the future. Already many daring attempts have been made, with remarkable success. While the daylight appearance of an interior is important (although there are many instances where the interior is essentially designed for artificial lighting), this question becomes of still greater importance when considering exterior design, and the best schemes are those which serve the dual purpose.

Lighted Building Surfaces.

While the main consideration, from a commercial point of view, is obviously that of giving a shop front added power of attraction, there is no reason why the architect cannot obtain both commercial attractiveness and architectural soundness by careful arrangement of lighted surfaces on the façade. In some instances, selected surfaces of the building may be lighted up from lamps concealed on the face of the building, and in others luminous surfaces may be provided by lamps behind translucent materials, such as opal or frosted glass. The character of the ordinary shop front only remains visible as long as daylight lasts, but, as soon as night comes, its identity vanishes, and it is in maintaining this identity at all times that architectural lighting can be successfully employed.

Exterior architectural lighting can be obtained by illuminating horizontal bands, the façade of the building being pro-

* From a paper read before the Illuminating Engineering Society on March 19th.

Digitized by Google

vided with white horizontal surfaces, each provided with a cornice to accommodate lamps on the upper side. The daylight architectural lines of the building are thus emphasised at night time.

Other façades of a different character are almost entirely composed of glass, and yet, in spite of this fact, the designs do not suggest that the glass is supporting the building. The interplay of vertical and horizontal lines can be made to give the design an interesting character, the lettering on the frieze being both decorative, and valuable from an advertising point of view.

A 625 kW Marquise.

The Galeries Lafayette, Paris [see THE ELECTRICIAN, March 30th, 1928, p. 351] represents a well-known example of marquise lighting, and is interesting from its magnitude and commercial value. The marquise, which is 500 ft. long, consists of a strong metallic frame to carry the glass, in the structural design of which great care was taken to permit easy access to lamps. The construction of such a large marquise presented a difficult problem. Most of the glass in the marquise is ribbed on one face, and designs are made by cutting these ribs in certain parts. Some portions of the glass are left clear, while others are rendered diffusing by sandblasting, or acid-etching, all of which gives variety and relief to the material. The marquise itself requires 800 lamps of 500 W each, while the outer edge, which defines its shapes, uses 1 500 lamps of 500 W each. There are, in all, 2 600 lamps, totalling 625 kW, and when it is borne in mind that the lighting circuits are arranged to give blending of colour it will be readily appreciated that the marquise appears at night time as a colossal jewel. The new marquise of Messrs. Selfridges is, perhaps, one of the best examples in this country of decorative exterior lighting of this kind.

The Lotus Shoe Co. in this country have recently embarked on a rebuilding programme, incorporating architectural façades to the shops of some of their more important agents, and that in Edinburgh is of special interest. The windows are lighted from reflectors placed above vertically hanging sheets of glass, and immediately above them a valance, consisting of decorative glass, is lighted by a number of small lamps, while, of equal importance, the lighting arrangement for the façia is neatly designed.

Messrs. Riddington's Tea Shop in Dover Street, London, is quite a recent example of the lighted shop front. White opal boxes, between which is placed patterned glass in colour, constitute the main features of the design. Behind the projection of the white strips at each end a diffusing glass box has been placed, which, after dark, gives a red light. This installation, unfortunately, lacks effectiveness at night, due to inadequate illumination, but the daylight appearance is good.

Simultaneously with the development of modern architectural lighting practice there has evolved a range of lighting fittings to accord with these modern conceptions. One might almost term these fittings as the necessary detail to architectural lighting. The design of these fittings is free and generally simple in character, the form of the fitting predominating. A further characteristic is the fact that there is a predominance of glass, and the tendency to employ a number of small lamps in the place of a few lamps of higher wattage, and frequently these fittings present quite an extensive luminous surface of low intrinsic brilliancy.

While the best results are only obtained when these fittings are used supplementary to the main architectural lighting, there are many instances where modern interiors are exclusively lighted by such means. When used, however, to supplement the illumination provided from truly architectural lighting, these auxiliary fittings are not necessarily intended to augment the general lighting of the room, but are provided with a view to obtaining luminous decoration. Consequently, the question of the luminous efficiency of the fitting is, therefore, frequently secondary in importance to the richness and decorative effect obtained.

Materials.

The translucent materials employed for architectural lighting vary from the more complete diffusing material, such as opal glass, to the less completely diffusing materials, such as acid-etched or sand-blasted glasses. In fact, as a result of this new movement, glass in the hands of artists has shown commendable results, and designers are employing innumerable glasses of different textures and degrees of diffusion to give interesting designs. In some instances, plate glass is used as the basis, and is decorated in various tones by all the known arts of etching or enamelling. In Germany, sheets of opal glass are being extensively employed to obtain architectural lighting effects, and its more complete diffusing properties enable it, in many instances, to give better results than can be obtained from sand-blasting and acid-etching. The process of enamelling glass is being perfected, and it is possible that enamelled glass will be extensively used in the future.

In France, in particular, pressed glassware is being used largely for lighting purposes. This glassware has been introduced in the forms of cubes, cornice units, picture rail units, lintel units, dentil units, column units, etc., and may be built up to serve many functions. For instance, the cubes may be built up in any desired shape, forming a ceiling fitting floor standard, or a single cube may be incorporated in a table standard or wall bracket.

Unfortunately, illuminating engineers are considerably handicapped in the development of modern forms of illumination, due to the lack of accurate data on the diffusing properties of their translucent materials. If some figure of merit for diffusion were available for the different materials it would be possible to prescribe rules for positioning of lamps, their spacing, and their distance from the translucent surface to obtain visually even brightness or, at least, a known diversity of brightness.

Lighting Demonstration Room.

With a view to giving architects and engineers facilities to study these new methods of lighting, the E.L.M.A. Lighting Service Bureau has inaugurated an architectural department. This department has already collected much important data on the lighting of public and domestic buildings, and has constructed a new lighting studio where some of the many aspects of architectural lighting are portrayed. In its conception the studio does not represent any particular interior, but is intended to show the effect of light in relation to space, and the importance of combining the lighting as an intimate element in the architecture, and to this end various systems of lighting have been incorporated. [A brief description of this studio was given in THE ELECTRICIAN of March 15th, 1929, page 318.]

In conclusion, I would suggest that in architectural lighting we have a logical way of introducing artificial light, and although there are many people who are sceptical about this new outlook I am convinced that, even with its limitations, it is a step in the right direction. Many critics of architectural lighting confine their criticism to the materials employed, but I feel that criticisms of this character do not in any way nullify the value of the principles involved. For instance, it is quite likely that moulded or sand-blasted glass may be superseded by opal or enamelled glass, but the general characteristics of architectural lighting in providing lighted surfaces of low intrinsic brilliancy is undoubtedly a rational solution to the problem of clothing electric light, and the methods employed have definitely architectural value.

The whole movement is as yet in its infancy, and its successful application is contingent upon the closest collaboration between the architect and the engineer.

SPRING-TIME WINDOW DISPLAYS.

Educating the Public on Positive Lines—The Spring-Time "Atmosphere"—Selling Rather than Showing—Individual Units versus the Crowded Window—Riveting Instead of Distributing People's Attention.

By A. EDWARD HAMMOND (Author of "Shopfitting and Display," and "Practical Aids to Retail Selling").

WITH the last E.D.A. Conference, "Organising for Increased Sales: Spring Cleaning Season, 1929," and the excellent paper read by Mr. H. W. Roberts fresh in their minds, electrical contractors will not surely need any further reminder of the importance of making their window displays not only as attractive as possible, but also that they must be imbued to the utmost extent with a spring-time "atmosphere."

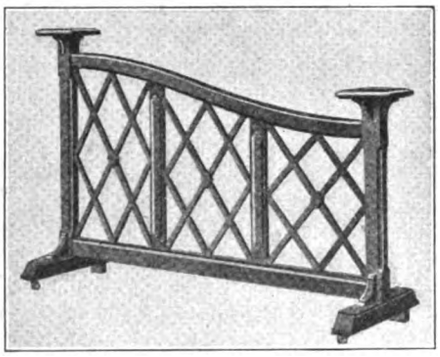

Fig. 1.—A useful display device for dividing a window into two sections.

In regard to the spring-cleaning appeal there are many angles of approach; but the main plank on which to build display schemes of the next few weeks is the positive assertion that modern electrical appliances eliminate the need for spring cleaning, with all its attendant disorganisation and worry. Alternatively, window displays might advantageously be carried out in conjunction with the message: "Use Electricity for Spring Cleaning this year, and thus avoid the necessity for Spring Cleaning Next Year." The inference drawn from this would be that with electrical appliances once installed, the possibilities of dust and dirt accumulating to such an extent as to justify an annual overhauling of the whole interior would be avoided.

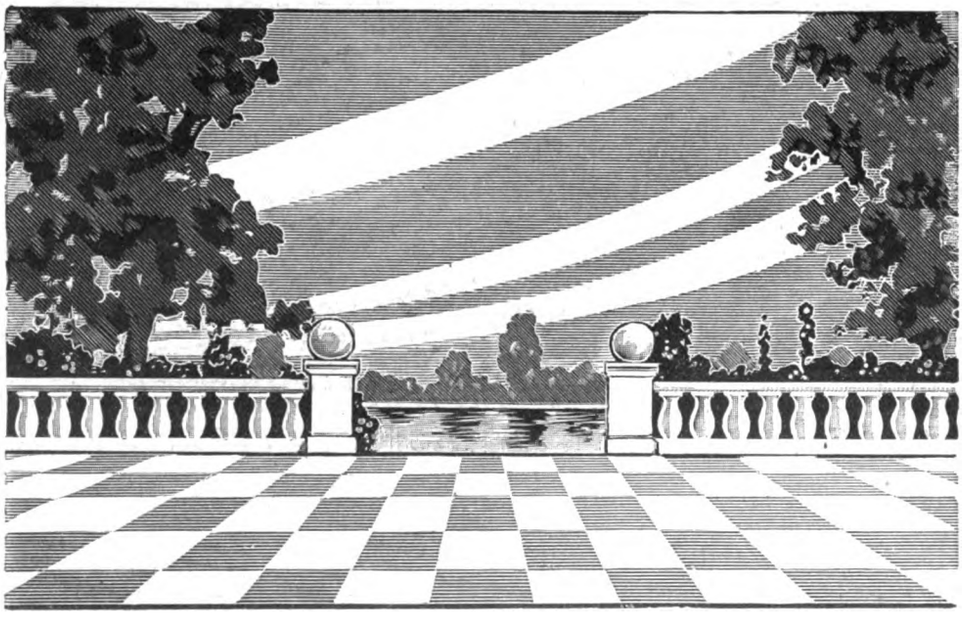
Mr. Roberts said in his lecture: "Spring Cleaning in an Electrical Age should be Non-Existent," but he thought that it would take two or three generations to kill this horrible annual upheaval. Well! It is in the hands of the contractors and the supply authorities, and, if they are content to leave it at that, the two or three generations will probably become two or three decades.

But why not a campaign to eliminate spring cleaning? It is not within my province here to suggest on what lines such a campaign should be run. It would obviously embrace all phases of selling, and one of the most powerful and effective educational forces would be the window display.

Neither contractors nor supply authorities yet realise the tremendous propaganda and direct selling potentialities of their windows. The window display still occupies an incidental place in the organisation of the business. The tendency is to regard it as a space which has got to be filled and made reasonably attractive, as well as being as representative as possible of the whole stock. That is an entirely wrong conception of the functions of the display window. It should certainly not be filled, and there is no earthly reason why any attempt should be made to show "something of everything." The only result is a confusion of the senses and desires of the passer-by, and a lessening of the possibilities of her making up her mind.

The average contractor evidently feels that he is not getting his money's worth out of his window if he does not use the display space to what he considers the best advantage, by arranging the electrical goods and fittings in such a manner that there is no "waste" space. The unit or group system has done a great deal in other retail shops towards breaking this habit of crowding the windows. Modernist display has achieved much more by making a proportion of the window dressers realise that unoccupied space is not necessarily wasted space. The open method of window dressing has now fortunately almost universally replaced the serried array of goods on shelves in rows, arranged to fill the window to capacity. It has even stopped some electrical contractors from *crowding* their windows, but it cannot truthfully be said to have prevented their *filling* them.

One of the aims of the contractor or the supply authority's window dresser in carrying out his displays should be to rivet the attention of the customer upon one line, for it is physically and mentally impossible to rivet attention upon a score or more of different classes of goods, no matter whether they are electrical or textile or tonsorial or gastronomical. On the contrary, the effect is to scatter it, or to distribute the window gazer's interest to such an extent that it dissolves, and the person concerned passes on unimpressed and unconvinced. If customers browse for any length of time over a shop window,



AN example of the scenic background, a most useful accessory for spring-time windows. Such display aids involve no work in preparation and are available in roll form on stout paper. The usual dimensions are 96 in. by 60 in.

After, say, a fortnight's use they can be rolled up and stored away quite easily until they are required again.

Digitized by Google

they generally continue to browse on to the next window. There are many people about who are hardened window gazers, to whom the shop window is nothing more than a means of entertainment, and it is perhaps not sufficiently realised that *not* every window gazer is a potential customer.

It seems there is a danger to-day of the shop window becoming a means of free information and entertainment for the public at large. Perhaps it is a tendency that is overlooked by the average electrical contractor in arranging his displays, and it is highly probable that this tendency would be eradicated if he or his display man would concentrate more upon *selling* in his window and less upon *showing*.

The contractor knows, or should know, exactly the class of customer to whom he wishes to make an appeal, for even in mixed districts it should not be difficult to determine a window display policy by striking a happy medium in the exhibition of electrical fittings, with an occasional incidental introduction of a high quality item. If the window displays are confined to a very few lines of the type most likely to appeal to local residents, in conjunction with, say, a background of seasonable suggestiveness, instead of being crammed in an attempt to make them representative of stock, as well as demonstrative of the contractor's professional capacities, he would have less window gazers, but more customers. He would eventually teach people to browse inside his premises instead of on the pavement outside.

Window Dividers.

It occasionally happens that the electrical contractor has sufficient window space to justify its division into two sections so that seasonable lines can be shown on one side and general everyday selling accessories in the other portion of the window. This can best be effected by the use of a window divider of the type shown in Fig. 1. This is preferable to panelling across the centre of the window, which has the effect of darkening portions of the display and frequently necessitating increased use of light.

The window divider comes in useful, too, when it is desired to make two distinctly different appeals in the window, say, one for high-class electrical equipment and the other for medium grade lines. Another advantage of the divider is that it can be used as a temporary window fitting, and is easily removed if a larger demonstration-display necessitates the whole space in the window being given up to one show.

A suggestion for a background with a decided spring-time appeal is shown in Fig. 2. In conjunction with such a background, labour-saving electrical household equipment should be displayed, with a sales message couched on the following lines: "Why slave indoors when the joys and beauties of spring are calling you outside? Instal electrical equipment and eliminate household worries, and thus free yourself for the enjoyment of spring."

Reference has been made before to the value of these scenic backgrounds. The great point about them from the small contractor's point of view is that they involve no work in preparation. They are supplied in roll form on stout paper, size 96 by 60 in., and need not be scrapped after they have had a run of a week or so in the window, for they can be rolled up and stored for a time, and then brought out again in conjunction with an entirely different range of electrical supplies.

The possibilities of plywood, laminated panelling, fibreboard, and similar materials should not be overlooked by the electrical contractor. These materials may be obtained in suitable sizes for converting to window enclosures. One popular range is supplied in the following dimensions: $\frac{3}{16}$ in. (standard) 3 ft. and 4 ft. widths, and lengths of foot multiples of from 6 to 16 ft.; $\frac{1}{4}$ in. (extra thick) 3 ft. and 4 ft. widths, and in lengths of 2 ft. multiples from 6 to 16 ft. This material has a matt surface which will take any paint, and can easily be sawn or cut into any shape or design desired.

Some of the modernist display fittings obtainable to-day may be described as windows inside windows, for they enable individual items or small groups of articles to attract attention solely to themselves, and thus to eliminate the wandering, hesitant, half-interested attitudes of the person who pauses to examine the window, and to inspire instead a conscious and concentrated attention which results in interested and undistracted study of the lines displayed.

It is interesting to notice that the British Electrical Development Association favour this style of display fitting. The display layouts and materials with which they are willing to supply contractors are characterised by simplicity. These, comprising such display aids as cubes, triangular blocks, black crêpe paper, and "cut-outs," lend themselves admirably for use in conjunction with displays limited to only two or three electrical specialities.

In this connection it may be mentioned that there is one new display fitting which the electrical contractor will find is worth noting, for, being illuminated, it has a suggestiveness about it which adds to its practical value. This is in the form of a luminous block a few inches square, which can be used singly or in numbers to form a support for goods displayed, or can be used in constructional form as a background, or painted with any lettering to convey the message of the window.

A Personal Analogy.

Perhaps a personal analogy may help to bring home more clearly to the electrical contractor or supply authority's display or showroom manager, who is still doubtful of the wisdom of reducing the contents of his window to a minimum, the importance of producing a concentrated effect in his displays. Let him walk past a hoarding covered with posters, remembering that he is in the same relation to the poster advertiser as the people inspecting his own window are to him, and then see not only how many posters he can recall, but how many have aroused his special interest or created in him any desire for possession. The probability is that he will have a blurred impression of the whole, and not any clear details of any individual features.

Then let him walk past one of the isolated groups of posters erected by The Empire Marketing Board, or glance at a smaller more tastefully arranged hoarding containing, say, six posters (of which, unfortunately, there are all too few). He will find that individual points stand out much more clearly in his mind after inspecting the last-mentioned range of posters.

Perhaps an even better and more convincing experiment is for the electrical contractor to apply the test to other shop windows—to a footwear dealer's or furnisher's windows, for example—any trade entirely remote from electricity, but containing goods which appeal to him purely as a private citizen.

If the contractor notices, as a "man in the street," the types of windows which induce him to buy, or, at any rate, to enter a shop, simply and solely by their power in arousing his interest, he will almost invariably find that they are the ones in which his attention has been drawn to one article or to a small group of articles.

As a final test he might have a special line displayed for a given period as a main feature in a window containing not more than three or four other articles, and then displayed for the same period in a well-packed window. Let him notice which window sells the most of those lines, and also how far his general trade is adversely affected by the reduced display. He will almost certainly find that, far from having an adverse effect, it will have had the result of bringing a steadily increasing number of people into the showrooms and will have been productive of a more satisfactory figure on the sales side.

I am indebted to Messrs. Samuel Elliott and Sons, Ltd., for the loan of the first illustration, and to Messrs. Dudley and Co., Ltd., for the second illustration.

TUNGSTEN FILAMENT LAMPS.

Chief Features of the Revised British Standard Specification.

THE British Engineering Standards Association has recently issued a revision of the British Standard Specification for Tungsten Filament Electric Lamps.

The chief features of this revision are the reduction in the tolerances allowed on the light centre lengths, while for lamps up to 100 W, the light centre lengths themselves have been reduced. The overall length of the lamp and the maximum neck diameter, together with the distance from the contact plate of the cap at which the measurement of the neck diameter is to be made, are also given. The light output of lamps and efficiency are now given in terms of lumens only, excepting that, in addition to the lumens output, the nominal mean spherical candle power output is given.

A change has been made in regard to the rating of vacuum traction lamps (series burning), the amperes at rated voltage being now adopted as a standard in place of volts at rated current.

Copies of this specification (No. 161–1928), may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1 price 2s. 3d., post free.

ELECTRICITY ON TYNESIDE.*

Pioneer Electrical Firms—The North-East Coast Exhibition—Bearing of Pulverised Fuel and Marine Electricity on Future Prosperity.

By R. E. ROBSON, M.I.E.E.

HALF a century will cover electrical development on Tyneside. In the '80's we had those pioneer electrical manufacturers, Holmes, with his "Castle" dynamo and the first quick-break switch; Scott and Mountain, who developed colliery electrification; Clarke Chapman, who have done so much towards applying electricity to ships' auxiliary gear, and then Parsons, who left the latter firm to revolutionise the generation of electricity and ship's propulsion. These firms, along with the Ediswan Lamp Works at Benwell, and the Sunbeam Works at Gateshead, employed amongst them a considerable number of men, and then again, there was the electrical department at Elswick Works in old Lord Armstrong's time, which was of considerable size and importance.

Where Tyneside Led.

In the past Tyneside, along with the north-east coast, has been in advance in electrical development of any other area in the country, perhaps in Europe. During the last decade we have seen electricity still advancing; those large works of Reyrolle's at Hebburn have extended and extended to meet the requirements of the finest control gear manufactured. Colliery winding, coal screening and many other applications of electricity have been adopted owing to cheap power being available, and great strides have taken place in domestic heating and cooking, as well as the wiring of many thousands of small houses on assisted wiring schemes. These undertakings have all been in advance of general practice, and have now become general.

Large capital has been laid out by the great electricity supply undertaking here in research work, experiments and trials, and heavy prices have been paid for specially designed material and apparatus for entirely new electrical departures. Much of the plant was bought at the top of the market when the demand for current was great, which saddles an older and enterprising undertaking with heavier capital charges than those concerns that are developing now, or have recently developed.

We on Tyneside are not going to see ourselves as busy electrically in the future, compared with other areas, as we have been; we are nearer saturation than in other places, and therefore have less scope for business. I say nearer saturation advisedly, because there are, in my mind, many developments still untouched electrically. We cannot hope for much extension in collieries, shipyards or engineering works, as few on Tyneside use any other power than electricity.

I am afraid that, even in rural electrification, there is little prospect of much development. Northumberland covers a large area, but most of it is sheep farms, and Durham is practically industrial. For rural electrification, we must get into fertile areas, where cultivation is very intensive.

At the present time, owing to the abnormal depression of trade in the district, the electrical industry is not normal, and will suffer for the time being. We have certain advantages at the present time; let us make the most of them, and get current-consuming devices adopted where they can be afforded, and perhaps even where they cannot be afforded, by the use of hire-purchase arrangements.

Tyneside must, for the next few years, leave no stone unturned to get business; it must induce everyone to use electricity for every purpose. Notwithstanding all our troubles and bad trade at the present time, we have put our backs to the wall, and have gone in for a great and extensive scheme, namely, that courageous enterprise, the North-East Coast Exhibition. This Exhibition will show to the public electricity in all its applications, and will let them see that it is vital to the community for health's sake, for cleanliness, for convenience, and that its use is necessary if our industries are to hold their own against competition.

The North-East Coast Exhibition should give the industry an impetus. Those who have not seen the interior cannot grasp the magnitude of the enterprise, and those who have the good of the electrical industry on Tyneside at heart must make it a success: failure would set us back for years, but there must be no failure.

What is going to be the position of electricity on the north-east coast in future? It seems to me that current will not be cheaper here than elsewhere. The cost of coal, with the great improvements in generating plant, is now a small fraction of the cost of supply, and our facilities will be no better than elsewhere. Works, such as those of the Imperial Chemical Industries at Billingham, who are using a large amount of current in a confined area, may find it profitable to open up in the coal area, but for the average manufacturer, anywhere will do now, providing he gets the water supply and railway sidings required.

I would like to offer a few suggestions which may seem very far-fetched and improbable, as to how the electrical industry may progress here and hold its own, and perhaps even keep ahead, as it has done in the past.

The outstanding advantage we have is the coal field. The electro-chemical processes, such as those adopted by the Thermal Syndicate which is against the wall of Carville, and where practically no distribution costs are incurred, may be developed if run in conjunction with power stations or waste heat or coking plants.

My view is that we should look to pulverised fuel for the salvation of the north-east coast. Pulverised fuel is only in its experimental stages, but it has a great future. Surely, through research and experiment, means will be found for storing and transporting it. If coal could be pulverised at the pit, or even below the ground, and sent by pipe lines to the bunkering docks, pumped aboard the ships, stored in our coaling stations, this would mean prosperity again for the north-east coast, and not only would it be an advantage to our district, but it would be an enormous advantage to the financial position of the country. Millions of money are now spent in oil, and instead of this money going abroad, it would be spent at home.

We are now waiting for an invention to find a method of storing and transporting coal-dust as easily as oil, and if this is done the north-east coast has a great future.

Incidentally, I notice that a British patent has been issued to the B. and L. Powdered Fuel Co. which covers the complete system of bunkering and unbunkering powdered fuel with inert gases, whether on land or sea, which renders the handling of all classes of powdered fuel absolutely safe from the risk of spontaneous combustion or explosion.

The Outlook.

It will be wondered why I am digressing on coal so much, but I am leading up to the point as to whether I think Tyneside can advance and again become the leader in an important branch of the electrical industry. My opinion is that it will be marine electrical engineering, with coal-dust either used as fuel for an internal combustion engine or to fire boilers for marine propulsion, the latter method being first, that we shall probably have to look to.

If speeches recently made by Sir Wm. Seager and Sir Philip Nash are referred to, they both hold out a great prospect for electrically-driven ships. Lord Kylsant stated at the recent Marine Engineers' dinner, that the mammoth White Star liner being built at Belfast was to be electrically driven.

Surely, Tyneside that built the "Mauretania," has works like Parsons, who built the largest of generators, shipyards that have built the largest battleships in the world, is equipped for marine electrical engineering. Why should Belfast or the Clyde take the lead? Why should these generators be built elsewhere, when everything, to say nothing of switchgear, could be built on Tyneside? There is scope for an enterprise such as this. Can Tyneside not respond? Surely an area that has produced such a wonderful electricity supply undertaking should not be backward, considering its facilities and experience, in developing electric propulsion at sea?

Consider what scope marine electrical propulsion has. Look at a liner or battleship. They would be complete power stations, super power stations, in many cases, 50 000 to 100 000 kW, with all motors and auxiliary gear. What an enormous amount of work and outlay of money, which could come to the district—engines, generators, motors, control gear, wiring, fittings, lamps—something for everybody.

We must look to marine electrical engineering and perhaps to railway electrical engineering—the self-contained unit in the latter case—for our future developments.

* Extracts from a lecture to a North-East Area Conference of the E.D.A. in Newcastle on March 20th.

ELECTRICAL INSTRUMENTS AND METERS FOR BULK SUPPLY & GENERAL MEASUREMENTS.*

Indicating and Recording Instruments—Integrating and Special Meters—Summation Metering—Instrument Transformers.

By C. L. LIPMAN, A.M.I.E.E.

THE paper gives a general survey of modern indicating and recording instruments and integrating meters for various purposes. Some particulars are given regarding recent improvements in induction type instruments and in phase-meters. Special meters are described for the purpose of special tariffs; together with methods used for obtaining summated consumption and demands. Finally, a few remarks are made regarding instrument transformers.

The rapid growth of electricity supply in "bulk" has brought to the fore the question of its proper measurement and control. The problems of correct measurement and registration of the fundamental electrical quantities have occupied the thoughts of power engineers and instrument makers for a long time, with the result that this branch of electrical engineering is now in a state of high development.

Recent Improvements.

The object of this paper is to describe some recent improvements in electrical instruments and meters for bulk supply and general measurements, and it is hoped that it may tend towards a better understanding of good metering practice.

For the measurement of electric current and pressure, moving-iron and induction type ammeters and voltmeters are recommended.

Considerable advances have recently been made in the design and construction of induction-type instruments, with the result that they can now be supplied with an inherent accuracy higher than B.E.S.A. first grade.

The following technical particulars relate to a new induction ammeter manufactured under the author's patents, and wound for 5 amps 50 cycles.

By way of comparison similar data are given for the ordinary shaded-pole type of induction ammeter.

	Nalder-Lipman improved induction ammeter.	Ordinary shaded-pole induction ammeter.
(a) Change of reading for a rise or fall of 1 deg. C. in temperature..	0·015%	0·4%
(b) Change of reading for a change of 20% up or down in frequency.	0·4%	12%
(c) Change of reading after being left in circuit for 2 hours ..	0·5%	3%
(d) Weight of moving parts ..	9 gms.	30 gms.
(e) Volt ampere consumption for full scale deflection	4	10

The new induction voltmeter and wattmeter possess similar advantages as regards accuracy and construction.

Wherever power-factor regulation is attempted, a direct reading power-factor meter is necessary, as it is out of the question to calculate the power factor from the readings of wattmeters, ammeters and voltmeters. The improvement of power factor of an a.c. system is a question of great importance, as a low power factor is extremely undesirable for several reasons. In the first place, the cost of the supply mains is largely increased if, for a given kilowatt load, the power factor is low, and the losses in the mains are likewise increased. The alternators can give a larger output at a high power factor, while at the same time the inherent regulation of the machines is better, the variation of the voltage with changes in the load being much less at a high power factor than when the power factor is low.

Satisfactory direct reading power-factor meters are of the moving-iron type working on the "alternating field" (as opposed to the "rotating field") principle. The distinguishing feature of these phase meters is that owing to their special construction no resultant rotating field is set up, and, consequently, no "rotational drag torque" upon the moving-iron system is produced, and the disadvantages and errors arising from that torque are eliminated.

For important polyphase circuits unbalanced load pattern instruments and meters should be specified.

Whilst most of the leading switchgear manufacturers have adopted this policy, the author is aware of instances where, by reason of economy, balanced load power-factor meters are being coupled together with unbalanced load wattmeters. The method of using a single-element meter assumes equality of current, pressure and phase angle on the three phases, a condition which is very rarely obtained on polyphase power circuits.

Considerable developments have taken place in chart recording or "graphic" instruments. In addition to recording ammeters, voltmeters and wattmeters, the details of which are well known, power-factor indicators and frequency meters have been introduced. Combination instruments are also obtainable for such purposes as feeder logs, etc., multiple pen recorders for telephone work, and revolution recorders or speed indicators, which generally consist of a magnetogenerator and a recording voltmeter.

Recorders have been specially adapted for fitting to electric trains, and a special system of cradle mounting has been devised which protects the instruments from the effects of excessive vibration.

These recorders give valuable information, and tend to promote the efficient and economical running of the trains.

With regard to the method of marking the chart, the original method was to fix a pen at the end of the pointer arm. The disadvantage of this method lies in the fact that errors due to the variation of the amount of ink in the pen can never be wholly eliminated. Various methods of getting over this difficulty have been adopted by different makers, amongst which the following serve as examples.

A tapping mechanism by which the chart is inked at regular intervals. The inking device consists of a short length of fine tube fixed to the end of the pen arm, one end of which moves in a trough, at the back of which is an inking pad; the other end taps on the chart at regular intervals, generally a quarter or half minute, and is depressed on to it by a bar actuated by an electro-magnet, thus (simultaneously) causing the ink to flow in the tube from the pad and making a dot on the chart. If the time intervals are sufficiently short, the record differs little from a continuous line.

Recording Methods.

The advantage of this method of inking is that the pen is not continuously in contact with the chart, and thus "pen to paper friction" is eliminated. This ensures accuracy, and is particularly valuable in the case of instruments wherein the forces are necessarily small, as in recording frequency meters and power factor indicators.

Another type of recording instrument which also gets over the error due to variation of ink in the pen was originally introduced by the Esterline Company of Indianapolis, and has since been further developed in this country by various instrument makers.

In this type the pen arm consists of a fine tube which is normally full of ink, one end moving in a vessel containing the ink and the other end over the chart; the error due to variation of the amount of ink is thus eliminated.

With regard to charts, there has been little alteration in these in the last few years.

Generally speaking, the hour, or time, lines are curved. Some time ago a recording instrument was patented by Murday, which gives rectangular co-ordinates.

Generally speaking, an integrating meter may be derived from the corresponding indicating pattern of meter by substituting for the spring control and pointer and eddy current brake and a counting train respectively. Practically all modern a.c. integrating meters operate on the induction principle, and are capable of giving a high degree of accuracy under working conditions. The most important integrating meter is the energy meter, upon the kWh readings of which is based the fundamental Board of Trade unit tariff for electricity supplied. For the meter to read correctly, the speed of rotation of the rotor must be proportional to the power in the circuit in which the meter is connected.

Numerous forms of construction of energy meters have been devised, the principal differences in construction being confined chiefly to:—

1. The arrangement of the operating electro-magnets.

*From a paper read before the London Branch of the Association of Mining Electrical Engineers.

Digitized by Google

2. The methods of obtaining the correct phase difference between the fluxes of the series and shunt windings; and
3. The method of compensating for friction.

Wattless component or reactive meters are similar to watthour meters; the only difference consists in the phase relation between the magnetic fluxes. In the wattless component meter the flux from the coil energised at the full pressure lags to such an extent that there is a phase displacement of 180 deg. between this field and the applied pressure producing it. For the purpose of registration of total kVA hours several methods have been devised, most of which are, however, of an approximate nature. The torque of the induction type a.c. meter changes with the power factor according to a sine function. As a result, the torque is practically constant in the neighbourhood of the power factor at which it is a maximum.

The instrument registers the kVA hours with a relatively small error, irrespective of the power factor. By suitable choice of the displacement between the active shunt flux and the impressed voltage, the maximum value of the torque can be arranged to occur approximately in the middle of the power factor range for which the instrument is designed. These meters are, therefore, only suitable for a fixed range of power factor.

Another method of arriving at the total kVA hours is by the employment of two meters, one of which is a standard energy meter and the other a wattless component meter. The total kVA hours is the vectorial sum of the two component readings taken over a given time interval.

The "Trivector" Meter.

A more recent development of kVA hour meter is the "trivector" meter, in which an integration of kVA hours is obtained by a mechanical combination of an energy meter with a reactive meter, and is suitable for use over a wide range of power factor and voltage. In another interesting construction of kVA hour meter the revolutions of these two meter rotors are transmitted to a suspended sphere, which rotates at a speed and in a direction representing

$$\sqrt{(WH^2 + (RVAH)^2}$$

A floating gear is arranged to take the drive off this sphere at the point where the peripheral speed is greatest, and this drive is transmitted to the maximum demand indicator mechanism which records the maximum demand in intervals of 15 or 30 minutes, both in kW and kVA.

The type of meter adopted for the metering of bulk supplies depends largely on the tariff which is selected for the supply. The usual form of tariff for a supply of this nature is one which includes a term proportional to the maximum demand on the system. Taking kilowatt maximum demand as the first example, the usual induction meter is used together with a Merz-type maximum demand indicator. The maximum demand is averaged over a certain definite period, which is controlled by a contactor. This contactor may be either self-contained with the meter, or separate.

As an alternative an averaging recorder is available. When the maximum demand is required to be in kVA a separate kVA and maximum demand indicator must be employed, or as an alternative the trivector type of meter can be used. The latter incorporates both kilowatt and kVA records.

A further alternative tariff is based on the average power factor or on the minimum power factor, as the case may be, given by the consumer. For the former tariff a reactive component meter or recording power factor meter is used in conjunction with the kWh meter, and for the latter a minimum power factor indicator is used in conjunction with the kWh meter. In connection with large supplies chart recording maximum demand meters of the "Printometer" or "Maxigraph" pattern are particularly recommended. Besides integrating the total energy consumed, they record the units consumed during successive periods, so as to demonstrate exactly the load conditions during each individual period of maximum demand. In connection with an interchange supply two simple watthour meters with ratchet devices can be used, one recording incoming and the other outgoing power.

A type of supply often met with in connection with bulk supplies is that where two or more feeders are used, and the load from each of these feeders has to be summated in order that a true maximum demand may be obtained. If the several circuits are supplied from a common voltage, then the secondaries of the current transformers are often connected in parallel to the current coils of the meter, the latter of course being wound suitable for the sum of the secondary currents. A better solution of this problem is to use meters compounded on to a common spindle. Four-element meters have been specially developed for this purpose. They integrate the total energy and simultaneously give an indication of the combined maximum demand in two or more independent circuits.

Numerous Applications.

Messrs. Nalder Brothers and Thompson have produced a four-element recording wattmeter of the improved induction type giving a uniformly divided chart combined with large working forces. This recorder finds a number of different applications, some of them being :—

(*a*) The metering of two independent supplies, as for example, sectionalised busbars, or a pair of feeders not paralleled.

(*b*) The metering of two supplies, one three-phase three-wire, and one three-phase four-wire.

(*c*) The metering of two supplies at different frequencies.

(*d*) The metering of two supplies at different voltages.

(*e*) The metering of three supplies, say one three-phase and two independent single-phase supplies.

The indicating pattern of the four-element wattmeter is fitted with a maximum demand pointer and the great utility of such an instrument in connection with multi-feeder supplies is quite apparent.

Where more than two polyphase circuits are involved special summation equipment becomes necessary.

In America such summation is carried out by the "impulse" method, but in the present author's opinion a more accurate, simple, and technically sound method is to convert the a.c. quantities to correspondingly proportional direct current voltages or currents and then add up the latter by means of ordinary d.c. meters.

Switchboard instruments and meters are, as a rule, working in conjunction with instrument transformers. The chief point in connection with an equipment of this nature is the type of current transformer employed. Considerable errors can be introduced to the metering equipment as a whole if this point is not carefully looked into. Generally speaking, for best results the nominal volt-ampere rating of the transformer should be as high as possible consistent with the requirements and the secondary burden as low as possible. Precision current transformers are now available having nickel-iron cores. The greatest difficulty arises when "bar" type or "bushing" type current transformers are employed with limited primary ampere turns.

Straight-through Metering.

Some time ago the author had been considering the problem of straight-through metering on extra-high tension systems with primary currents as low as 10 A, in conjunction with Messrs. Nalder Brothers and Thompson, Ltd., and Messrs. A. Reyrolle and Co., and we concluded our investigations with the development of a new series of highly efficient low volt-ampere consumption instruments, including ammeters, wattmeters, power factor meters and protective relays, the current windings of which were made suitable for a secondary current of 0·5 A instead of the usual 5 A. This recommendation has now been approved by the Central Electricity Board for the British grid.

The advantages arising from 0·5 A as full-load secondary current instead of 5 A are manifold. The 0·5 A metering improves the performance of the bushing transformer, permitting a finer turn adjustment; it reduces the secondary burden; it reduces the losses in the long run of connecting leads; it enables accurate measurements to be carried out in the usual manner on extra high tension systems; and it has led to the development of a new and improved series of instruments, requiring very low power consumption and giving exceptionally high working forces, control springs of normal strength being employed.

In order to keep the size and weight of the low ampere-turns bushing transformers within reasonable limits, it is further recommended to make the magnetic core of such transformers of metal laminations.

From the above considerations it is clear that "straight-through" metering in general, and that metering of high-tension bulk supplies in particular, can now be carried out economically and with a high degree of accuracy.

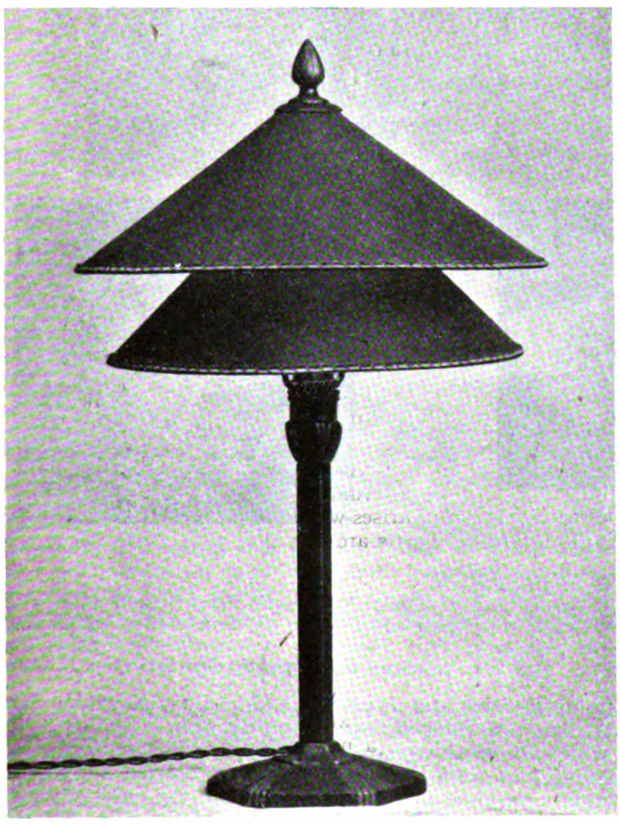
MODERN LIGHTING FITTINGS.

Beauty as a Medium for Light—Lovely Children of the Ugly Gas Bracket—Recent Tendencies in Fittings Design—Illuminated Ornaments.

FOR several years past we have called attention to the need of a higher standard of attractiveness for fittings designed as coverings for the electric lamp used for interior lighting. Over two years ago we saw, and explained, symptoms of a coming definite change in the methods of domestic and other interior lighting, and now, in 1929 it is generally recognised that it is no longer necessary to have sources of light which do not give real pleasure to the eye both as lamps and as daytime decorations. The following notes, compiled after a brief tour of some of the London showrooms should, therefore, be of interest to those supply authorities and contractors who desire to get away from the more conventional lighting styles.

For the initial introduction of some of the best forms of fitting, credit is largely due to M. Réné Lalique, an artist in glass, who has produced, in Alsace, a surprising variety of exquisite pendant and appliqué fittings—moulded, engraved, coloured.

Breves' Lalique Galleries carried out the lighting in the principal rooms of the Hotel Cathay, Shanghai. In the dining room were used: "Swallows" hanging bowls; "Birds"



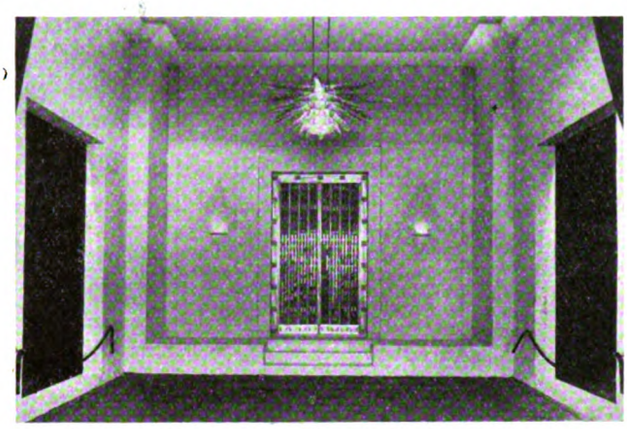
A novel table lamp by Best and Lloyd.

wall brackets, the design consisting of an elegantly shaped lower vessel containing water, through which the light passes, with an upper purely decorative panel depicting birds swooping down to drink; and "Ladies of the Fountain," set into the pillars of the room. The last-named were designed, as each symbolising a river of France, for the Exposition des Arts Décoratifs of 1925; a remaining one is on view at the showrooms, 2, Basil Street, Knightsbridge, London, S.W.3.

In the bedrooms, opalescent "shell bowls" were installed. These nearly hemispherical bowls have decoration in the form of four shells, their points meeting at the centre to produce an effectively simple effect. Bathrooms were fitted with "Stalactites lights," in ice colour—appropriate for Shanghai's summer.

Sir Philip Sassoon's ballroom at 25, Park Lane is lighted with four "Sunflowers," which are spherical pendants. Each division of the convex surface is of brown glass engraved with a sunflower; orange frosted Osram lamps are used.

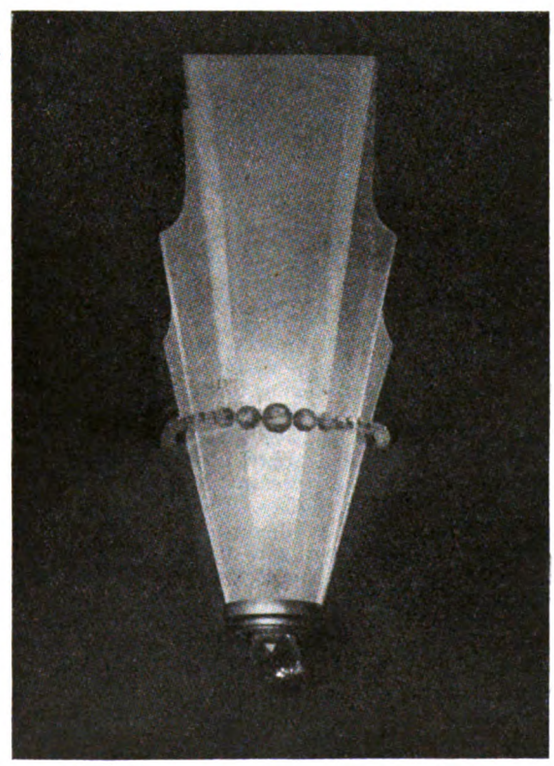
Table lamps are catered for by the adaptation of coloured vases of marvellously detailed designs, which form the bases. The vases are filled with water, which gently reflects the downward rays from the bulb. A fascinating development is seen in illuminated ornaments. There is a carp, constructed to stand on a bronze base which has at top a glass disc (for which any colour may be used), with the result that the 40W lamp



A modern décor showing the "Lustre Piccadilly" hanging lamp by Lalique.

in the base can impart to the fish above a sea-green or any other shade.

Best and Lloyd, Ltd., who are now located at 40, Great Marlborough Street, W.1, are doing good work in adapting Continental ideas to conform with the architecture of general British interiors. "Firelight" glass, manufactured by the firm, is used effectively, and a hand-spraying process on obscured rimpled glass produces panes with graduated tones—delicate orange merging into pale yellow. The light is said "to flatter everything and everybody," and this claim is certainly not without foundation. Simplicity is the basis of



A delightful wall fitting by Louis Dernier and Hamlyn.

most designs. An example of the wall brackets conceived by the firm, in conjunction with Mr. P. Morley Horder, F.R.I.B.A., for Nottingham University is illustrated. In such brackets brass supports are generally used for the glass panels.

In the showrooms at Magnet House, Kingsway, W.C.2, the General Electric Co., presents many interesting fittings in "Perlique" glassware; many of the designs employ polygona

MODERN LIGHTING FITTINGS.

THESE pictures of modern lighting fittings show :—(1) *The Neolux* (*Louis Dernier and Hamlyn*); (2) "*Lustre Paris*" (*Lalique*); (3) *Applique bronze fitting* (*Borghys and Ling*); (4) *Wall plate with obscured rimpled pane* (*Best and Lloyd*); (5) *Bracket in etched glassware* (*General Electric Co.*); (6) *Wall bracket on enamelled wood frame* (*Osler and Faraday*); (7) "*Sunflower*," *a design favoured for ballroom lighting* (*Lalique*); (8) "*Hornbeam*" *bowl, available in grey or brown* (*Lalique*); (9) "*Mistletoe*," *another popular spherical design* (*Lalique*).

panels in accordance with modern artistic ideas. Diffusion is carefully studied and some of the colour schemes are distinctly interesting. A particular forte of the G.E.C. is architectural lighting.

An effective and inexpensive innovation is found in the "Icicle Shades" of H. G. Ascher, Ltd., Manchester, who are represented in London by Messrs. Plowman and Blackett, 40-44, Holborn Viaduct, E.C.1. These shades are made of Czecho-Slovakian glass; to display melting they are internally frosted for the upper half of their length, an artifice helping to prevent glare. The chased appearance results from spraying with cold water when the glass is red hot. It is claimed that the reflective powers given by the incisions allow a 40 W. lamp to give similar effective illumination to that given by a 60 W. lamp in other fittings.

"Atmospheric lighting" is the term applied by Osler and Faraday, Ltd., 89, Newman Street, London, W.1, to the current method of concealing light-giving points; in many of their pendants the maximum of diffusion is very successfully attained. One unusual wall bracket has Japanese lacquer mounts carrying coloured daum dishes.

Pressed glass fittings in a large range of designs and prices are shown by Messrs. Borghys and Ling, 4 and 5, Warwick Court, Holborn, W.C.1. They are the work of M. Sabino, whose entries at Paris exhibitions are well-known. Of particular interest to those desiring pleasing and novel pendants at fairly low prices is the standardised glass box used as a unit in many quite different settings.

Louis Dernier and Hamlyn, Ltd., of 23, Newman Street W.1, have developed very recently the "Neolux" unit of which the most arresting features are efficiency and ease of cleaning and packing. In these lamps slotted supports for the glass are used in place of angle-iron, the chief advantage being that, even with very large lamps, there is no danger of splintering through the rapid contraction, at different rates, of glass and iron when switches are opened. The single-unit pendant "Neolux" consists of four parallel glass panels—for which many shapes and shades can be chosen—held in place by a metal frame, the three upper panels being pierced to receive the opal lamp. In wall brackets and pendants, the panels can be removed readily by any one; pendant supports fold, and lamp positions and suspension lengths are adjustable.

Reproductions of several interesting designs by Bagues, Ltd., adjoining 22, Grosvenor Square, W.1, have already appeared in THE ELECTRICIAN. At the moment, this firm seems to be concentrating on threaded-crystal work, with Prince of Wales feathers as the foundation of most designs. "Nacrolaque" appears frequently.

Troughton and Young, Ltd., of 143, Knightsbridge, S.W.1, is another firm which is playing a vigorous part in developing the new lighting art, and readers will doubtless remember that a number of their productions were illustrated recently in these columns. The special showroom which they have equipped for the display of new lighting fashions is probably unique both for the novelty of its arrangement and equipment, and for its suitability for the purpose for which it was designed.

WATER HEATING DEVELOPMENTS.

Electrical Applications Outlined at E.D.A. Conference—Controlling the Load at Off-peak Times—Remarkable Progress at Croydon.

AT the final E.D.A. Salesmanship Conference of the present session, held in London, on March 15th, Mr. M. O. F. England, of Messrs. Benham and Sons, Ltd., dealt with water-heating developments.

Electrically-heated water boilers, Mr. England said, could not only be arranged to supply all the hot water required in a system, but could also be arranged to act as a standby plant to some other fuel such as oil, coke, and gas. Another application was for humidification, the steam being drawn off through ducts containing warmed air, and distributed to the point or points where it was required. Sterilisers could also be heated electrically, and were frequently controlled automatically. There was also the application of electricity for heating water to prevent freezing in large tanks.

A more unusual application of electric water heating was for what was known as continuous bathing, a process used for soothing mental patients in asylums, the heated water entering at the foot of the bath and returning at the head. A bottle containing 2 kW immersed type element was situated at the end of, and below, the bath, the thermostat lying parallel with the flow, the water in this way being kept at a constant temperature.

Apart from purely domestic water boilers, there were the non-pressure, and the pressure, types of boiler used for restaurants and tea rooms. In the former, the water was boiled electrically, either by clamped on or immersion types of elements, whilst in the pressure type of boiler the elements were usually immersed. Thermostatic control of the non-pressure type of boiler had, until fairly recently, been regarded as an enormously difficult problem, and still remained so when the water was boiled in urns.

Owing to the effect of a water heating load upon central stations, it was urged that the aim should be to encourage water heating at off-peak times, and it was further suggested that calculations, at least for large buildings, must be based upon a charge of ¼d. per unit.

High tension boilers had been developed principally for high loadings and were suitable only for a.c. systems. With these boilers there were no elements, the water inside the boiler acting as a resistance through which current passed direct from the h.t. mains. Heat regulation was a comparatively simple matter, although the necessary relays were rather complicated. With large units containing wire elements, the problem of automatic control was greater. The electrode type of boiler had been made as a three-phase boiler up to 6600 kW capacity. It could operate up to 16 000 V, although boilers on this principle could be obtained for voltages as low as 500.

Heating of Floors.

Apart from the improvement of load factor by water heating controlled at off-peak times, another kind of off-peak load was being developed in connection with the heating of individual radiators, in which a mass of material or a quantity of water was heated, the heat absorbed being allowed to dissipate itself, under control, when the current was switched off. In Germany experiments had been carried out with the heating of floors by means of buried wires. It seemed to the lecturer that floors could be heated in much the same way as walls and ceilings by hidden hot-water pipes.

Mr. England then gave some explanation of the various types of apparatus for controlling off-peak hot water heating. Manual operation, of course, under the control of the supply undertakings, was the simplest and cheapest, but he did not know of any case where this was adopted in practice. The most common form of apparatus was the time switch.

Reference was then made to Mr. George Wilkinson's "change-circuit" method, the aim of which is to supply water heating loads entirely automatically without load jumps of any kind. Mr. Wilkinson provides "change circuits" which are operated at the sub-station in such a way that as the line or network load increases, the water heating loads are decreased in the same proportion, or in a proportion best suited to the running of the station.

Dr. Ferranti had made a special study of domestic water heating loads, and had evolved a device which would cut off water heating circuits when the current taken by other circuits reached a pre-determined value. This scheme seemed particularly sound, because the levelling devices were cheap to instal, and because metering was simple. Mr. Wilson, of Ashford, had developed a scheme of automatic water heating control in individual houses. By means of a pilot wire control and house relays, he caused the water heating circuits to be shut off when the street lights were lit up. A system in operation in Southend only differed from this in detail.

In the "M.O.F.E." system of pilot wire control, a current transformer was fitted at the power station having a two-way switch arrangement controlled by the current in the main bus-bar. Alternating current at a low potential was conveyed by two pilot wires to the customer who had a mercury relay switch. The station transmitter was adjusted to cut off the current at a pre-determined value. Future developments in a similar direction might be made by the potential drop along a cable in the street, the voltage rise in the cable causing a house or building relay to operate and cut off the heating circuits.

THE DISCUSSION.

In the discussion which followed, Mr. C. H. RAYNER remarked that the paper had little to say about salesmanship and was more suitable for a meeting of the I.E.E. In his view thermostatic control was not necessary with domestic water heating appliances.

Mr. P. M. EDINBOROUGH urged the need for closer co-operation between the supply authorities and manufacturers in order that an efficient range of apparatus might be produced, at a suitable price, to meet domestic requirements. Indeed, the time was ripe for the formation of a joint Committee to consider the subject. We should concentrate on apparatus suitable for from 5 to 20 gallons with a loading not exceeding 1 kW, suitably controlled by some bi-metal type of thermostat, because that type was cheapest to produce. A booster element was also necessary, not perhaps as a standard but for those people who desired it, for the purpose of getting a number of baths from, say, a 20-gallon boiler.

Mr. BRYAN spoke of the success of the lagged storage cylinder up to 30 gallons capacity in private houses, and also of apparatus for raising the temperature of water quickly for industrial purposes. For instance, in film washing, the electrically heated geyser had proved to be the solution of the problem of varying the temperature in a manner which was impossible with the storage system. At the same time, heating water to a very high temperature for domestic purposes was quite wrong, as a lower temperature was ample for all ordinary purposes.

Mr. HONEY said that during the cold spell the contractors and the supply authority in Croydon made such sales of heating apparatus that the demand on one sub-station went up by 120 per cent. His experience had shown that with current at ¼d. per unit or less it was possible to compete with 500 B.Th.U. gas at 3s. per 1 000 cu. ft. for water heating. At Croydon they had specialised on the storage type of apparatus having a capacity varying from 1½ to 33 gallons. In this way 1 000 apparatus having a maximum demand of 800 kW had been connected to the mains, the machines being always connected to the supply with thermostatic control. A special night tariff of ¼d. per unit between 11 p.m. and 7 a.m. was in use, the hire charge being £2 8s. 6d. per quarter with a rebate to the consumer if he had not used the maximum number of units. This charge covered hire of heater, time switch, separate meter and the total number of units that could be used during the eight hours. At Croydon, there was a 2 000 000 units per annum water heating load out of a total of 34 000 000 units, with 30 000 consumers.

Mr. F. SELLY spoke with regard to the cost of heating London tap water to a temperature of 150 deg. and gave details of experiments he had carried out. With current at 0·3d. per unit he had found that to heat 1 000 gallons of London tap water per day throughout the year—the figures are the average of the years 1922-23-24—to 150 deg. F. cost roughly 7s. 1d., or 1d. for 10 gallons; with current at 0·375d. per unit the cost worked out at 8s.9·37d., whilst with current at 0·5d. per unit the cost would be 11s. 8d. per day. It was therefore, advisable to adopt the storage system for domestic purposes, using thermostats and sufficient storage and taking advantage of night tariffs.

ELECTRICITY AND SALES PROMOTION.*

Importance of Accurate Market Surveys—The Language Question—Need for Intensified Electrical Propaganda—Increasing the Home Market.

By T. H. McARTHUR (Managing Director, Edward Hunter and Co., Ltd.).

NOBODY who comes into contact with average British selling methods will be inclined to dispute a single point of the notable speech made by the Prince of Wales on the eve of the British Industries Fair. Our salesmanship is too often but a poor advertisement for our goods, and the attitude of mind of many of our manufacturers is reflected in their "take it or leave it" methods of doing business.

There is only one factor that has saved us from commercial oblivion, and that is the quality of our goods. That quality has withstood ineptitude in selling on a major scale, and the outlook of many of our overseas customers must be one of amazement that such people are able to produce such effective goods.

An Anachronism.

The whole outlook of the majority of our manufacturers is that of the parochial politician, who can see good in no one, who trusts no one, who learns from no one. That may be the result of conservatism carried to the *n*th degree, or it may be evidence of British reserve. In either case, it is anachronistic in this highly competitive world, and the sooner a more intelligent and more enterprising outlook takes its place the sooner shall we obtain that measure of prosperity which our ability as manufacturers has won for us in the past.

Let us take a leaf from American practice in this direction. They are alive to the need for facts, facts, and still more facts, in relation to their business.

"Every business must rest upon three legs: finance, law and facts. Good financial advice is obtainable, good legal advice is not hard to come by; but accurate facts must be worked for with patience and intelligence," says a well-known American publicist, and the correctness of his remarks cannot be denied.

Economic facts are elusive; they are not obtained by sitting in an office and waiting for data to come out of the blue. They must be pursued, and in their pursuit they demand highly-trained technicians, men possessed of the cold-blooded temperament that actuates the truly scientific mind. All over America there are men trained for this work, to whom facts are all-important. They do not colour the data they collect to suit their own inclinations: they regard the unsupported statement as anathema. They give market surveys which are models of accuracy, full of cold facts that are allowed to speak for themselves. They go right down to fundamentals: they build from the foundations upwards.

When an article is to be put on the market, these trained men analyse that market with knowledge and care. They take every possible precaution to see that their client is prevented from making big or little mistakes. The mass of data they produce is not written for the sake of filling so many pages of foolscap: it is based on psychology: it deals with matters of wrapping and packing; in indicates the appropriate type of carton for the article: it suggests the best slogan: it outlines the advertising media to be used: it suggests suitable "copy."

All this data is not collated by haphazard methods. One of the most valuable sources is found in the readiness with which American manufacturers are willing to exchange information, and a logical sequence to the manufacturers' policy is a willingness on the part of the retailer to co-operate in the creation of market surveys and marketing plans.

Both the manufacturer and the retailer have come to realise that it is good business to help business, and this attitude of mind is dictated by business acumen and not by sentiment. Its success is proved by the amazing expansion in American business, and it is only the seemingly unlimited capacity of his home market to absorb merchandise that makes export a secondary consideration to the average American producer for the time being.

If that home market of his were anywhere near saturation point, the position of British exports would be substantially worse than it is to-day: and it most certainly behoves us to put our house in order before the scientific selling methods which have brought such immense prosperity to United States manufacturers are turned to the capture of overseas markets.

I often think that our finest advertisement to the visitor from abroad is the Pullman train which whisks him from the landing stage to London. A railway compartment that is a model of luxury and comfort, an outward and visible sign of our prosperity and appreciation of the comforts of life.

Our visitor comes to a London hotel—and there are none better in all the world, seasoned travellers will tell you—and then sets about doing business. Maybe he visits the British Industries Fair and finds it located in a semi-derelict, draughty, awkwardly placed situation, some considerable distance from anywhere. He buys a catalogue besides which the programme of the Horse Show is a miracle of good printing and fine production, and then he wanders round the stalls, wondering why on earth he came all this distance to see so many exhibits displayed in such an inartistic setting. Not a very flattering contrast to the Leipzig Fair!

Perhaps our visitor goes into the provinces, and he finds that his reception at those works at which he calls is typically abrupt—a sort of "who-are-you-and-what-do-you want?" attitude. He is often met by an ignorance of his own language which makes it doubly hard for him to do business unless he happens to speak English freely.

In that point is indicated one of our greatest weaknesses, both here and in our overseas representation. We assume that everybody talks English, and if they don't, "then they darn well ought to"! Your Continental manufacturer is either a first-class linguist himself, or else he has ample staff to handle the visitor. How many thousands of young Continentals are to be found in Great Britain, and how many young Britishers go abroad to learn languages? The answer is well known to every observer, and yet this language question is of real and growing importance. The German salesman is at least tri-lingual, knowing German, English and French—and often he can speak Spanish and Italian as well. If he is doing business in South America, he speaks the Spanish of that part of the American Continent unless he is in Brazil, when he will talk Brazilian Portuguese. He knows that the language bar is a severe handicap and he takes the necessary steps to surmount it.

The idea that the Britisher is a bad linguist will not stand examination. We are lazy about foreign languages—that's all, and we must overcome this laziness if we are to win a volume of overseas trade commensurate with our post-war manufacturing resources.

But all these points, important as they are, sink into insignificance beside the attitude of mind that is so reminiscent of the small shop-keeper. I often think the truth of Napoleon's contemptuous phrase "a nation of shop-keepers"—was its greatest insult.

An Advertising Point.

Many of our manufacturers believe in gargantuan stocks of goods and Lilliputian expenditure in sales promotion in all or any of its branches. The idea that stock must stand at £10 000 to permit of an advertising expenditure of £1 000 is so different from the American theory that has proved so successful—they take £10 000 worth of advertising space when their stock stands at £1 000 and they arrange to meet the business that advertising, properly carried out, brings to them.

The American sells by reason of his courage: we sell in spite of our lack of confidence. We are conservative: the American is progressive. The last ten years have seen all the accepted theories of so-called economists shattered into a thousand pieces by the strides which American production has made. Where is the limitation of output in Detroit? Where is the exhaustion of the market for Pittsburg steel?

Courage and applied salesmanship have conquered the preconceived "laws" of economics, and in their place there has arisen a new state of affairs. The upward tendency of living, not only in the United States, please remember, but in Great Britain and elsewhere, has created a thousand new desires, a thousand new lines of production.

Electricity alone has opened up so many new markets that

[* This article, from the pen of a well-known authority on sales promotion, contains many points of interest to readers of THE ELECTRICIAN.—ED.]

Digitized by Google

we are beginning to realise that we have another world to deal with, another field to supply with its electrical requirements.

Let us tackle this new field with properly directed efforts. Let there be genuine collaboration amongst those engaged in the electrical industry in all its branches. Let manufacturers of all kinds of electrical equipment be willing to pool their knowledge of the home and the overseas markets. Let the almost innate sense of distrust be banished once and for all from the minds of those directing this great and comparatively undeveloped industry. Let us have some system of creating public interest in the advantages of electricity, some body which is really competent to make electricity a living force in both public and private life.

Surely there are enough "bull" points for electricity to permit of much more systematic propaganda in which advertising plays its appointed part? I have the interest of the average man in something new, and if I have studied the advantages of electricity I have done so of my own accord. The information I happen to possess has been sought out: it has not been handed to me by any manner of means.

That this is a fact simply goes to prove the need for intensified propaganda for the electrical industry, and the present is almost an ideal time for widening the basis of our co-operative advertising. We are emerging from a slough of considerable despond and people's minds are unusually receptive. Here is an opportunity for the industry to capitalise the present propitious circumstances and to undertake a really intensive campaign for more electricity users.

Let us strengthen our hands for attacking the overseas markets available for this industry by increasing our home market to something much nearer its capacity than the present position indicates. With a substantially larger turnover here at home—and there is no shadow of doubt that this market is capable of immense expansion—we can bring down our overheads at our factories, and beat the foreigner on his strongest point—his price.

Given, at the same time, a willingness to profit by other people's successes and to learn from our own mistakes, I can see such a future before the electrical industry as will go a long way to compensate the nation for some of the irretrievably lost markets in other classes of manufacture.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Electricity and Motor Boats.

[To the Editor.]

Sir,—As a Londoner who used to find week-end peace and quietness in skiff or punt on some of the beautiful near-by reaches of the Thames, I am grateful to you and to Mr. H. T. Young for the protests against the development of the motor-boat craze on our rivers and at popular seaside resorts.

During recent years, the amenities of the Thames, and doubtless many other rivers, have been ruined by the use of outboard motor boats, and the threatened production of these foul-smelling water churning devices on a large scale bids fair to make the rivers quite useless for ordinary boating unless those participating turn out in bathing costumes and provide themselves with a sufficiency of baling instruments.

As you rightly point out, people who require some non-manual means of propulsion cannot do better—for their own convenience as well as that of other users of our beautiful waterways—than adopt electric propulsion.—I am, etc.,

"Aquatic."

Shepperton, March 23rd.

A Fountain of Light.

[To the Editor.]

Sir,—The picture reproduced on page 361 of your March 22nd issue of a fountain of light suggests a development which might be encouraged for the decoration of domestic interiors. Many people are deterred from using illuminated fountains because of the difficulty, real or supposed, of securing the necessary water supply. A device which is capable of imitating a fountain of water by means of neon tubes, without any water, should therefore prove popular. As, however, I have not yet had an opportunity of observing the effect of such an arrangement, I am anxious to know whether anything has been done along those lines in this country. If any of your readers have seen one perhaps they will be good enough to give their opinions in this column.—I am, etc.,

C. H. Dodswell.

Blackpool, March 25th.

"Developing the E.D.A."

[To the Editor.]

Sir,—Whilst agreeing that the Electrical Development Association needs greater financial support from the industry, I do think that the Association should put a considerable proportion of the increased revenue to a contingency fund which would thus allow it to counter rival propaganda on certain occasions. Only the other day a well-known daily paper issued a film supplement, the first advertisement in which made surprising claims for the employment of gas for cinema lighting and heating. The issue was remarkable for the absence of any reference to the uses of electricity in this field.

Perhaps E.D.A. holds the view that the use of electricity is so widespread in cinemas that it is unnecessary to advertise the fact. If it does, it only furnishes another instance of our tendency to under-estimate competition. The gas industry is using all the arts of advertising and propaganda. Surely we of the electrical industry cannot do less.

The example quoted is only one of many current instances. In fixing its publicity appropriation, E.D.A. should provide something for such contingencies.—I am, etc.,

H. Murdon.

London, March 25th.

Electrical Firms and the B.I.F.

[To the Editor.]

Sir,—I have a recollection that immediately prior to the British Industries Fair this year Mr. T. R. Martin made a special point of writing criticisms of the Birmingham Section in order that the Fair may be further improved in 1930 and subsequent years.

Criticisms, both constructive and otherwise, were frequently heard during the period of the Fair, but there seems little evidence that these views have since been transmitted to the proper authorities. As it is desirable to have these matters aired well before next year's exhibition, I venture to put forward my own views in the hope that they will stimulate discussion among electrical exhibitors.

(1) Visitors travelling by rail should be able to book direct to Castle Bromwich if desired.

(2) Invitation tickets should be exchangeable at the Fair entrances for a season ticket valid for the duration of the Fair.

(3) The general public should be excluded.

(4) Additional and more effective steps should be taken to secure the attendance of prospective overseas buyers.

(5) Special arrangements should be made for the entertainment of foreign buyers.

(6) Banners similar to those displayed in the gas section this year should hang in the electrical section.

(7) Electric battery vehicles should be employed for transporting visitors from the main entrance to the electrical exhibits.

(8) Electric heating should replace the gas fires in the cloakrooms.

The views of your readers on these points would, I feel sure, be of great interest and value.—I am, etc.,

"Hopeful."

London, March 25th.

THE BATTI-WALLAH'S SOCIETY.

At the annual general meeting of the Batti-Wallah's Society the following officers and committee were elected for 1929:—

President: Mr. H. L. Howard; Vice-President: Mr. H. J. S. Mackay; Hon. Sec. and Treasurer: Mr. M. Whitgift; Committee: Messrs. A. E. Apps, G. M. B. Hilton, H. S. Jacob, W. E. Lang, H. S. May and A. E. Mohring.

At a Committee meeting on March 19th, the following were elected Batti-Wallahs:—Mr. E. A. Gatehouse, Mr. H. D. Harris, Mr. J. W. Porter, Mr. E. Stuart Russell, Mr. A. A. Campbell Swinton, F.R.S., and Lt.-Col. W. A. Vignoles. It was also decided that in future the entrance fee for new members shall be increased to two guineas.

For the Society's luncheon on April 25th, at which Sir Hugo Hirst will deliver an address, tickets (5s. 6d. each) may now be obtained.

ELECTRICAL APPLIANCES FOR SPRING TRADE.

Manufacturers' Suggestions for Promoting Sales in Spring Trade Goods—Some Selected Domestic Electrical Items Described.

THOUGH a certain amount of space is devoted each week to describing new lines of interest to the electrical industry, we have this week confined such descriptions to those items which electrical contractors will find appropriate to spring trade requirements. The appliances are, of course, in considerable demand all the year round, but in the spring such items as vacuum cleaners, etc., possess even added attractions to the feminine mind. The bright days of spring, the longer hours of daylight, the sunshine, all reveal the necessity for new lamp shades, etc., while the increased labours associated with spring cleaning lend themselves to the sale of labour saving devices.

We give below, in brief, a few suggestions from manufacturers as to what, in their opinion, may be regarded as suitable spring trade lines, and though on account of space it has not been possible to give complete descriptions of these appliances, sufficient information is given upon which an opinion may be formed.

We have received from SMITH AND ANSELL, LTD., of Acocks Green, Birmingham, particulars of the new "Essalite" lighting unit. This fitting embodies more advantages than at first might be supposed and, in dealing with these, the maker's point out that when the half watt lamp was introduced the necessity for screening and diffusing the brilliant filament was partly responsible for the bowl fitting becoming generally adopted. This type of fitting, though possessing many virtues, suffered from the disadvantage of being a dust collector and because of this was, in a measure, responsible for the "enclosed unit" being designed. Whilst this type of fitting avoided the dirt-collecting possibilities of the bowl fitting, in many cases it created a difficulty arising from the method of carrying the glass. First, it is in some cases, risky, and the heat generated by the lamps sometimes causes the glasses to crack as a result of expansion against the binding screws. Secondly, access to the lamp for replacement or for cleaning is not easy. In the case of the "Essalite" enclosed unit the glass fitting is suspended from chains attached to studs fitted to the lower portion of the bowl, while the top portion may be lifted off without difficulty for purposes of cleaning or replacing the lamp.

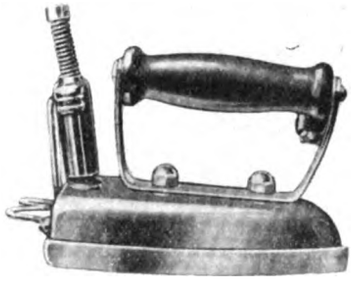
Among the many domestic electrical appliances of the ELECTRIC HEATING CO., of George Street, Croydon, may be mentioned a 3-pint coffee percolator with a 400 W loading. The body of this appliance is made of seamless aluminium, while the handle is of heat-resisting material.

The SLOAN ELECTRICAL CO., LTD., 8-12, Golden Lane, London, E.C.1, is marketing an electric washer under the name of the "Locomotive." This machine is made of metal throughout, is fitted with a seventeen ounce copper boiler and washes by means of a "loop" action without a mechanical device inside the washer. The machine is fitted with an electrically-driven wringer, and an electric water heater is fitted directly under the bottom of the tub, the consumption of the heater being 6 A. A special ironer attachment is available for use with the "Locomotive," the shoe being a 26 in. type,

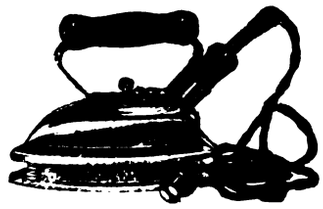
An electrical device of interest to motorists is the "Setalite" fitting of SETALITE, LTD., 314-322, Regent Street, London. W.1. This is a device which automatically lights the lamps of a car at a given time. In appearance it resembles a speedometer, and is 3 in. in diameter. The same device can be fitted to nursery lighting circuits, electric fires, water heaters, etc.

GEORGE KENT, LTD., 199-201, High Holborn, London, W.C.1, are now marketing an electrically driven knife cleaning machine which is designed to clean 500 to 800 knives per hour.

SOME SUGGESTIONS FOR PROMOTING SPRING TRADE.

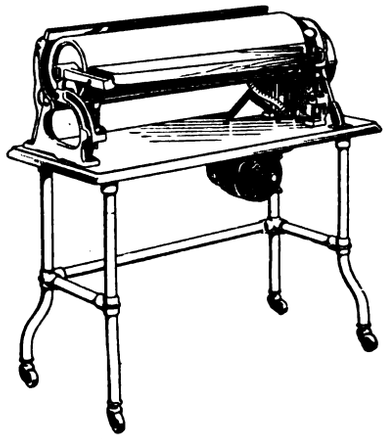


The 250 W, 3½ lb. iron of The Electric Heating Co.



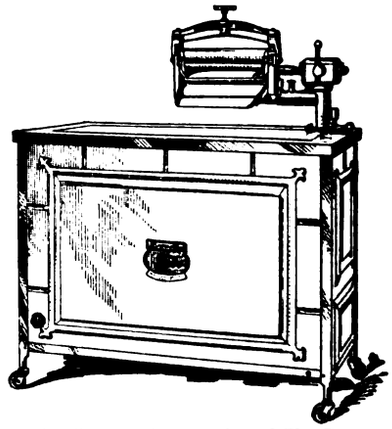
The safety iron of L. G. Hawkins and Co., Ltd.

A 5 lb., 450 W iron by The Electric Heating Co.



One of the ironing machines offered by L. G. Hawkins and Co., Ltd.

An attractive cooker by The General Electric Co., Ltd.



The "Locomotive" washer of The Sloan Electrical Co. Ltd.

Digitized by Google

These machines are specially constructed and so arranged to meet the requirements essential when in use at hotels, schools, etc. They are mounted on a heavy iron base plate, and are fitted with starting switch, special spring pressure, driving chain and special motor, ready for use. Similar machines are also made for cleaning fewer knives, the range extending from 2, with a space for carvers, up to ten. The machines are available for both a.c. and d.c. supply. The same firm also markets an electrically-driven ice-cream freezer fitted with a ¼ H.P. motor and starting switch. This is made in various capacities ranging from 6 to 20 quarts. Other freezers fitted with ½ H.P. motors have capacities of 10, 14 and 20 quarts.

The SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, London, W.C.2, has introduced a range of violet ray outfits under the trade name of "Vilite." These equipments are available in four types. The latest addition to the range of "A B C" washing machines by the same firm is the "Spinner," so called because of the spinning dryer contained within the machine. The container for the dryer is a cone-shaped compartment without perforations, which is rotated at high-speed so that water forced out of the clothes will rise up the inclined sides and out over the top into a special reservoir provided. The washing tub contains an aluminium agitator which gives 104 impulses per minute. Both the dryer container and the tub washer are made from one piece "Armco" metal, finished inside with royal blue vitreous enamel. The machine is fitted with two controls and a single motor drives both the washer and the dryer. The "A B C Oscillator" washer and the "A B C" super model 65 E are also machines of interest when considering spring trade possibilities.

The COOPER STEWART ENGINEERING CO., LTD., 136-137, Long Acre, London, W.C.2, have introduced a novel grill and toaster, fitted with cooking pan and "griddle" plate. The makers claim that no less than 49 different dishes may be prepared with the appliance, while the consumption of the device is 600 W.

The BRITISH VACUUM CLEANER AND ENGINEERING CO., LTD., of Parsons Green, London, suggest that the "Goblin" electric vacuum cleaner, Model G.50, is another suitable line for spring trade. This is a new model with an improved construction of the motor and turbine unit which now floats in rubber, thus insulating the motor housing.

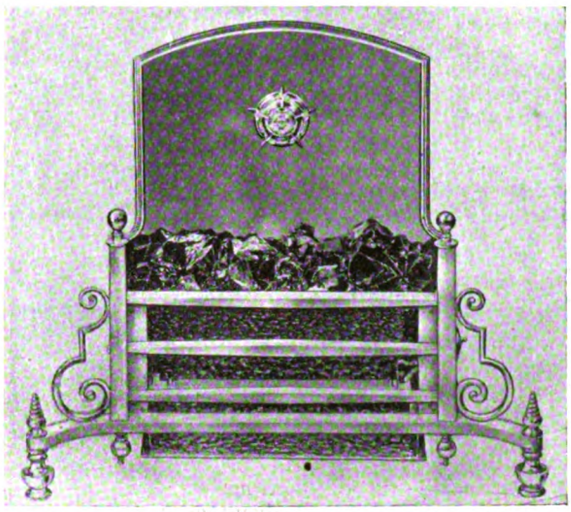
Among the "Magnet" range of domestic appliances of the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, may be mentioned the automatic cut-out type electric kettle fitted with a device which protects the kettle and element from damage should the kettle be allowed to boil dry or the current be switched on with the kettle empty. The safety device takes the form of a fusible link which causes the circuit to be broken before any damage can be done due to overheating. The kettle is made of heavy gauge copper and is mounted on three heat insulating feet. The handle upright incorporates a device to prevent the lid falling when the kettle is tilted. The "Magnet" electric wash boiler is another line, and this operates on the thermo-syphon principle. The machine is controlled by a three heat switch and heat loss is reduced by ample air spacing between the inner container and the outer casing. A pilot lamp holder is provided on the switch box for use if desired, and by means of the 4-core C.T.S. flexible both the boiler and switch box can be earthed. The "Magnet Minor" electric cooker for three or four persons is another item of spring trade interest and this with a total wattage of 3 200 is provided with separate self-contained units for boiling and grilling, and the grill element. Part of the oven heater is separately regulated, an additional switch being fitted to control the bottom heat when required.

Vacuum Cleaners and Refrigerators.

The HOTPOINT ELECTRIC APPLIANCE CO., LTD., 24, Newman Street, London, W.1, also offers an extensive range of spring trade items such as the "Premier Duplex" and "Junior" vacuum cleaners, electric washers and ironers and a comprehensive range of small appliances, such as irons, coffee percolators, immersion heaters, kettles, and so on.

Probably the chief item of interest in the range of the BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych London, W.C.2, is the new refrigerator which was shown at the Ideal Home Exhibition. A very comprehensive range of domestic lighting fittings is another suitable line, while the radio appliances offered also fall within spring trade possibilities.

METRO-VICK SUPPLIES, LTD., Charing Cross Road, London, W.C.2, also cater for the needs of spring trade, the range including cooking and heating devices, small appliances, vacuum cleaners, and fittings. Radio receivers and loud speakers are offered in numerous designs, including moving coil instruments. The safety kettle and gyratory washer will play important parts, while the already widely known range of "Cosmos" cookers will also receive attention. Many of the models have been improved in some way or other, the cookers offered being of such diversity in design as to fulfil every possible requirement. Another interesting line is the small model cooker designed for use in flats, bungalows, etc. This



An electric fire for use during the chilly spring evenings is another suggestion. The model illustrated is by Metro-Vick Supplies, Ltd.

is made in two types with one 8 in. diameter boiling plate, or with one 6¼ in., and one 4¼ in. boiling plates; extra rapid boiling and totally enclosed tubular elements are fitted. The "Cosmos" table model boiling plate is also a recent development, and this is mounted on a suitable stand with nickel-plated lag plate and fitted with either a 6¼ in. boiling ring rated at 1 200 W, or with an 8 in. plate of 2 000 W rating. Metro-Vick Supplies, Ltd., have also introduced a number of new "Silverstone" glassware fittings.

SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38-39, Upper Thames Street, London, E.C.4, offer small domestic appliances such as shaving mugs, irons, electric irons, toasters, safety kettles, etc., while the range of shades available is one of the most extensive. The company's suction cleaner is another interesting line.

The ELECTRIC APPLIANCES CO., LTD., 8, Fisher Street, Southampton Row, London, W.C.1, suggest the "Eureka" model 11 vacuum cleaner and steriliser as a spring trade item, and this, it may be interesting to note, is quickly adaptable for use as a motor-car cleaning appliance.

The EDISON SWAN ELECTRIC CO., LTD., 123-5, Queen Victoria Street, London, E.C.4, also suggest vacuum cleaners as being appropriate to the season. The "Ediswan" machine, made for a.c. and d.c. at all standard voltages, is of the bag type and is available with a wide selection of attachments.

The "Junior" and other cookers of the JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1, are further interesting lines, while the company's other appliances, all of which have been previously described, also offer a wide selection.

Apart from water heaters, table stoves and saucepans, SADIA, LTD., 22, Newman Street, London, W.1, offer an electrically heated drying stand. This has been designed with a view to overcoming the difficulty experienced in wet weather in drying clothes, washing, etc.

As so many electrical appliances of all kinds have been introduced for use in the kitchen, this drying stand is made to take to pieces and can be packed away when not in use. It consists of a box heater loaded to 750 W, single heat, mounted on a wooden white enamel post. The extending arms are made of wood and can be placed in any position. The heater and arms can each be adjusted to four different heights, so that anything from an overcoat to a handkerchief can be dried. The heater can be used separately for heating a room or drying cupboard and it can also be used for drying fruit and vegetables.

Where summer bungalows and so on are being prepared for the forthcoming months the new "Delco-Light" plants

Digitized by Google

of FRIGIDAIRE, LTD., Chapter Street, London, S.W.1, are of interest. These are made in a variety of sizes for water systems and lighting.

L. G. HAWKINS AND CO., LTD., of 30-35, Drury Lane, London, W.C.2, have recently placed on the market a new all-electric laundry equipment which comprises the "Universal" washer and dryer, the "Coffield" ironing machine, the "Universal" washer and wringer, and the "Universal" super automatic electric safety iron. The first of these is equipped with a centrifugal dryer and what is claimed to be a new safety cleansing action is also combined in this washer. It is of the agitator type and empties itself electrically. The "Coffield" ironing machine is driven by an electric motor, and is suitable for institutions, hotels, etc. An electric iron is also marketed by the same company. It is known as the "Universal" super automatic safety electric iron. The chief of its features is that the current is automatically switched off when the iron reaches the temperature of 575° F., and remains off until switched on again. In addition to this, two conveniently placed finger-tips controls enable the user to regulate the heat of the iron according to the fabric being ironed. The weight is 6 lb.

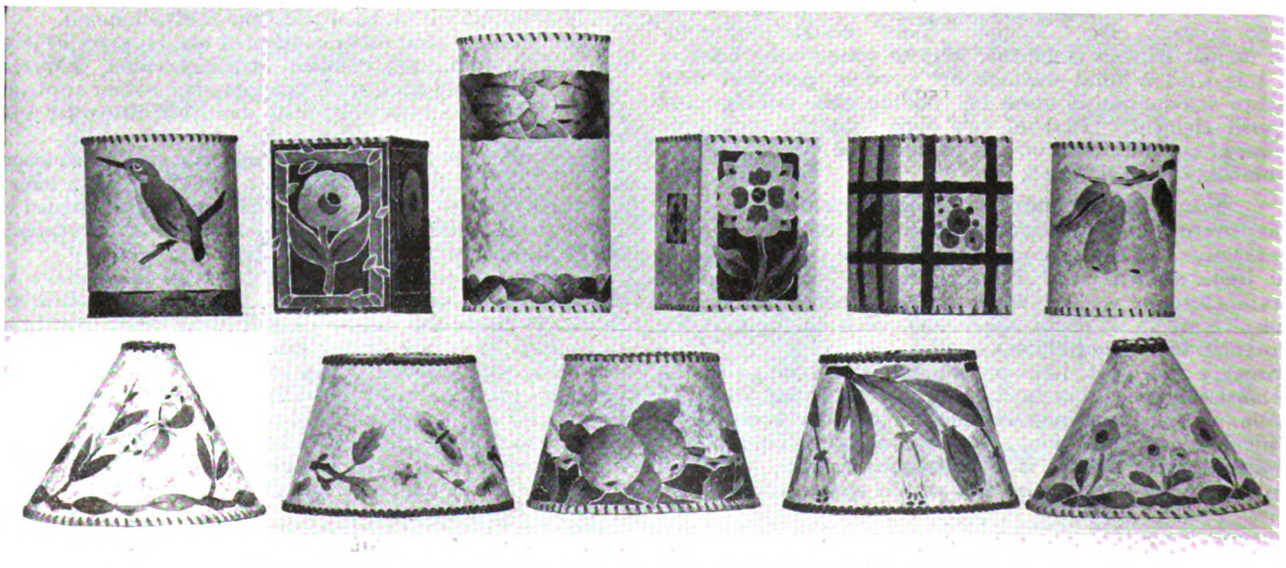
The new "Eureka" cleaner with the sterlising attachment in use.

GEORGE NOBBS, LTD., of 89, Cleveland Street, London, W., have introduced the "Genii" Maclaren thermostats suitable for the automatic temperature control of all kinds of electric water heaters and domestic hot water storage tanks. The chief features of the device are robust construction with minimum of moving parts, and one type is adjustable so that it can be used in any position through the side, top or bottom of tanks or even in a canting position. It is fitted with an adjustable temperature regulator with a dial graduated 100–200° F., which simplifies adjustment to any temperature without guesswork. The expansion movement is by invar steel rod and brass tube for the "M.T." type control and by the addition of bellows to obtain finer regulation, for room and refrigerator controls, etc. A tank protection sleeve with spring clip is provided so that the thermostat may be inserted or withdrawn without drawing off water in the tank, while the mercury tube switch is fitted with a ceramic liner to withstand the flash at the breaking of the electrical circuit, thus prolonging the life of the tube.

A new immersion heater, which embodies several notable improvements in design, is being put on the market by CHARLES JOYNER AND CO., Icknield Square, Birmingham, the makers of "Angelus" electric fires and cookers. The new heater is made in all loadings from 0·25 kW to 10 kW—the latter size being intended for heavy duty in large institutions—and utilises four heater tubes. The contacts in all types are self-aligning and of ample capacity, and the elements are so arranged as to permit of easy withdrawal without necessitating the removal of the tube or the emptying of the tank. Switchgear on the walls is eliminated, the mains being connected to a busbar system in the heater. The loading on the surface of the tube is arranged at a low wattage per square inch, so as to minimise the formation of deposit from impurities in the water. The same firm is producing a new "Angelus" cooker for small family work, in which the grill chamber is fitted with a front drop-door, permitting the whole of the heat to be utilised both during and after cooking. The boiling plate with griller combined is braced to prevent warping and cracking, and the oven is vitreous enamelled throughout.

CREDENDA CONDUITS, LTD., Oldbury, Birmingham, are now manufacturing a range of kettles having extra heavy bodies, handles and feet, large diameter lids and swan-neck spouts. Each kettle is supplied with 6 ft. of connecting cord, and in the case of the 2 pint 650 W and 3 pint 650 W models, lamp adaptors are provided. These models are each fitted with two elements, while other models are 3 pints, 975 W; 4 pints, 975 W; 6 pints, 1 300 W and 8 pints, 1 300 W; these have 3, 3, 4 and 44 elements respectively. A 2½ pint kettle with a rating of 500 W and a whistling model in 2 and 3 pint sizes, with loadings of 650 and 975 W respectively, are other interesting items offered in the domestic range. A wide selection of cookers and fires is offered as well as tubular and pedestal heaters.

The REGENT LAMPSHADE CO., of Brixton, London, S.W., has introduced a wide selection of parchment shades which have a seasonable appeal. These are painted on both the inside and the outside, thus giving a good depth of colour. Some of the many shapes and designs available are illustrated below.



A range of shades offered by the Regent Lampshade Co., all shades are painted on both sides.

NEWS IN BRIEF.

The Annual Meeting of the B.E.A.M.A.—The British Delegation to Russia—Hired Cookers in Manchester—Hull's Good Progress with Assisted Wiring—The Shanghai Electricity Undertaking—German Enterprise.

A NEW electric lighting experiment is being made in the choir of St. George's Chapel, Windsor Castle.

The total production of electricity in the United States during January amounted to 8 218 544 000 kWh.

During Whit week the Electrical Trades Union is holding its annual conference at Blackpool, when 60 delegates will attend.

The annual conference of the Cheltenham Branch of the Electrical Association for Women took place at the Town Hall, on March 20th.

The Thames Conservancy Board has decided to purchase, at a cost of £3 200, electric cranes for the wharves at Kingston and Hampton Wick.

The British Columbia Government has adopted legislation for placing complete control of the sale of electrical energy in the hands of the Provincial Water Board.

Electricity as applied to the printing trade will be clearly demonstrated at the International Exhibition of the Printing and Allied Trades, to be held at Olympia, London, from April 11th to 25th.

At a meeting of the Meter and Instrument Section of the I.E.E. on April 5th, Mr. E. W. Hill will read a paper entitled "Some Technical Considerations Concerning Power Factor in Relation to Tariffs."

The Calgary Power Company is now operating 332 miles of 66 000 V lines and 839 miles at 132 000 V. The Canadian Utilities Corporation has 130 miles of 33 000 V lines and 232 miles at 132 000 V.

At the next general meeting of the Institution of Automobile Engineers, to be held at the Royal Society of Arts, on April 9th, Mr. H. S. Rowell and Mr. C. G. Williams will read a paper entitled "Automatic Spark Advance."

Members of the Cardiff Branch of the Electrical Association for Women made a tour of inspection of the Roath power station last week, and were afterwards joined at tea in the mess-room by members of the Electricity Committee.

A meeting of the Institute of Wireless Technology will take place on April 8th at the Engineers' Club, London, at 7 p.m., at which a lecture will be given by Mr. M. A. Hutchins entitled "Wireless Receiver Design from Pre-Broadcasting Days to the Present Time."

Features of a new coal handling plant which has been installed at Sutton Harbour by the Plymouth Coal, Co., Ltd., are two electrically-propelled cranes, by the aid of which it will be possible to deal much more quickly and easily with the discharge of cargoes from steamers.

It is reported that the Beauharnais Power Co. will accept the conditions imposed by the Canadian Federal Government in connection with the approval of plans for the power development project of the St. Lawrence under a 75-year concession granted by the Quebec Legislature.

At the annual dinner of the Northern Division of the E.P.E.A. at Manchester, on March 23rd, Dr. B. Mouat Jones referred with satisfaction to the progress made in negotiations between the Association and educational authorities with regard to an apprenticeship training scheme.

Among the representatives of 150 firms and trading organisations forming the British Delegation to Russia, which left London on Monday, are members of the staffs of Messrs. Mather and Platt, R. A. Lister and Co., Ruth's Steam Storage, Henry Wiggin and Co., Messrs. Spencer Melksham, and Marshall, Sons and Co.

Mr. E. J. Lansbury, speaking at the first annual dinner of the Liverpool Branch of the Guild of Telephonists, on March 23rd, said the Guild was making progress. Their first task was to secure recognition from the Postmaster-General. The advance of science in telephony meant that in time the human element would become redundant.

Princess Mary Viscountess Lascelles has kindly consented to be present at a special matinee of "Mr. Cinders" at the Adelphi Theatre, London, on Tuesday, May 7th, at 2.30, in aid of the John Benn Hostel and Milner Hall, Bower Street, Stepney, E.1. Binnie Hale and Bobby Howes and the entire company will appear, and the minstrel troupe, composed of boys of the Hostel, will also give an entertainment. Tickets (from 2s. to 16s.) from Miss F. Robinson, Bouverie House, Fleet Street, London, E.C.4, or from the box office at the theatre.

The Clyde Navigation Trustees are about to erect a new electric cantilever crane at Stobcross Quay.

An electric goods lift is to be erected at the North British and Mercantile building, St. Vincent Street, Glasgow.

Mr. Justice Clauson decided in the Chancery Division last week that a wireless set is classed as household furniture.

Demonstrations of radiators, fires, cookers, etc., are being given at the electrical exhibition now being held in the Council Offices of Formby U.D.C.

The number of orders received by Manchester Corporation for hired cookers during January was 61, and 56 were connected, making a total of 5 081.

Hornsey Electricity Committee recommends the purchase of a Hewittic rectifier set to be installed at the electricity works, at an estimated cost of £3 886.

Gravesend Electricity Committee recommends that to celebrate the 25 years' successful working of the electricity undertaking, the staff and employees be entertained.

Following the installation of electricity in several of the houses at Thornton, Mr. H. Wallace, addressed the Young People's Guild, on March 15th, on "Electricity in the Home."

Carlisle Electricity Committee has instructed the Electrical Engineer to prepare a scheme for additional facilities under the assisted wiring scheme, for applicants occupying Council houses

A meeting of the Paisley Association of Electrical Engineers was held on March 19th. Awards in connection with apprentice papers were made. The annual supper and smoker were given on Tuesday.

Bradford Parks Committee has expressed its thanks to the Electricity Department for the excellent arrangements made for the illumination of the Lister Park Lake on the occasion of the recent ice carnival.

At a meeting of the Western Centre, I.E.E., on Monday, Mr. S. E. Britten gave an informal lecture entitled "The Planning and Layout of a Rural Overhead Line." The E.D.A. film "Country Currents" was also shown.

At a meeting of the Institution of Engineering Inspection at the Royal Society of Arts, London, on Wednesday, Mr. A. M. Hallawell gave a lecture entitled "Acoustics in relation to the Gramophone and Radio Loud-speaker."

The New England Power Association, one of the power units of the International Paper and Power Company system, produced 121 728 000 kWh of electric energy in February, an increase of 18% over February, 1928, and 51% over February, 1927.

For a small extra charge the German Post Office now delivers telegrams consisting of "greetings," such as Christmas or New Year wishes, birthday, wedding or betrothal congratulations, etc., on forms bearing coloured pictures suitable to the occasion.

Last week a number of members of the E.T.U. employed on buildings in London ceased work with the object of enforcing their demand that men employed on lift construction should join the E.T.U. The lift work contractors maintain that they cannot coerce their men to join the union. About 250 men in all had stopped work up to the time we went to press, and no settlement had been arrived at.

Good progress has been made by Hull Corporation's assisted wiring scheme, and it was reported last week that over 600 applications were being dealt with.—Hull electricity department will supply electricity free of charge for the flood lighting of public buildings during Civic and Empire Week in October.

In further reference to Shanghai Municipality's desire to transfer its electricity undertaking to private enterprise, with regard to which a note appeared on page 352 of our last issue, a committee appointed to report on the tenders has recommended acceptance of the offer of the American and Foreign Power Co., amounting to over £10 000 000.

At the annual general meeting of the British Electrical and Allied Manufacturers' Association, on March 21st, the result of the ballot was announced electing the following to fill five vacancies on the Council: Brush Electrical Engineering Co., Ltd.; D. P. Battery Co., Ltd.; Electromotors, Ltd.; Ferranti, Ltd.; and Worthington-Simpson, Ltd. Mr. Victor Watlington, managing director, the English Electric Co., Ltd., was at the subsequent Council meeting elected to succeed Col. R. K. Morcom as chairman of the Council.

PERSONAL.

STOCKPORT Town Council has appointed Mr. W. L. Chubb as mains superintendent.

Mr. James A. Robertson has been elected President of the Manchester Association of Engineers.

Worcester City Council has appointed Miss K. N. Shaw as lady demonstrator at the electricity showrooms.

Senatore G. Marconi and Mr. David Sarnoff have joined the board of the Gramophone (H.M.V.) Co., Ltd.

Dr. T. Yamamoto has been elected president of the Japanese Institute of Electrical Engineers for the ensuing year.

Stockport Electricity Committee has recommended the appointment of Mr. Robert H. Lee as electrical engineer.

Mr. E. L. Tappin, electrical engineer, has been elected a member of the Committee of Lewes Chamber of Commerce.

Marlborough Town Council has increased the salary of Mr. Rance as electrical engineer from £60 to £85 per annum.

Tonbridge Urban Council has appointed Mr. F. Young as installation engineer on completion of his probationary period.

Derby Town Council has increased the salary of the borough electrical engineer, Mr. G. H. Lake, from £1 100 to £1 200 per annum.

Mr. C. Furness, electrical engineer and tramway manager, Blackpool, has been appointed officer in charge of the transport department.

Admiral H. W. Grant has relinquished his position as joint managing director of the Eastern Telegraph Co., a position he has held since 1918.

Mr. J. N. Lindsay, boiler house charge engineer, Hull Corporation, has resigned on obtaining an appointment with the London Power Co.

Mr. Frank Redgrave Cripps, electrical engineer, has been nominated as a candidate for the Durrington Ward on the Worthing Town Council.

Mr. F. A. Dracup has resigned his position as motors and hiring superintendent in connection with the Birkenhead electricity undertaking.

Sir Edmund Wyldbore-Smith has been elected a director of the Metropolitan Railway Co., in succession to Sir H. C. W. Verney, who has resigned.

Ilford Electricity Committee recommends that the salary of Mr. H. King, assistant commercial manager, be increased from £500 to £550 per annum.

The late Dr. C. S. du Riche Preller bequeathed by his will the sum of £100 free of duty to the Benevolent Fund of the Institution of Electrical Engineers.

Estate of the gross value of £139 125, with net personalty £116 039, was left by the late Mr. R. M. Horne Payne, founder and chairman of the British Columbia Electric Railway.

A marriage has been arranged and will shortly take place between John Andrews, eldest son of Sir Ernest and Lady Benn, and Ursula, only daughter of Sir Maurice Alers and Lady Hankey.

Dr. J. A. Fleming, whose knighthood was announced in THE ELECTRICIAN, together with other electrical names in the New Year Honours List, will henceforth be known as Sir Ambrose Fleming.

Mr. Lachlan Mackinnon, general manager of Glasgow tramways, has been elected a member of the executive of the Municipal Tramways and Transport Association. Mr. Mackinnon will represent the Scottish area.

Mr. F. S. Hayburn, deputy managing director of the Marconi International Marine Communication Co., Ltd., was elected on Monday as Conservative representative of the Grove Park Ward of the Brentford and Chiswick U.D.C.

Fifty-six applications have been received for the post of general manager of Aberdeen Tramways Department, rendered vacant by the appointment of Mr. William Forbes to a similar post at Cardiff. The applications include one from Malta.

Mr. Godfrey Gerry, charge engineer at the Newport Street Electricity Works, Stonehouse, was recently presented with a music cabinet by the staff of the Electricity Department on the occasion of his leaving to take up an appointment at Hornsey.

Manchester Electricity Committee has appointed Mr. A. Williams, at present assistant resident engineer at Stuart Street, to the position of assistant resident engineer at Barton, and Mr. C. D. Milsom, at present engineer-in-charge, as assistant resident engineer at Stuart Street.

Mr. Andrew R. Cooper, assistant engineer to Mr. J. Clarke at the Silverwood Colliery, near Rotherham, has been appointed (out of 420 applicants) electrical engineer at the Dorman Long Collieries, near Dover, Kent, and he has been presented by the Silverwood officials and staff with a Jacobean oak timepiece with Westminster chimes.

Hull Electricity Committee has recommended that Mr. C. I. Shuttleworth, deputy city electrical engineer, be paid the difference between his salary as deputy engineer and the full salary paid to Major Bell for the four months during which he was in charge of the undertaking before Mr. J. N. Waite took up his appointment in Hull. It was also unanimously resolved that a letter of high appreciation of the services of Mr. Shuttleworth accompany the payment.

We understand that Mr. C. McKinlay has resigned his position with Metro-Vick Supplies, Ltd., and has been appointed sales representative for England, Wales and Ireland for Lane and Girvan, Ltd. We are also advised that Mr. Douglas Arthur, who was recently associated with the electrical department of the Falkirk Iron Co., Ltd., for a number of years, has been appointed in a similar capacity to represent the company in Scotland.

Mr. Frank Buckley, general manager of the Bury Municipal Tramways, who is leaving to become general manager to the Norwich City Tramways Co., has been presented with a gold hunter watch by the officials of the Tramway Department and Depot and Traffic Staff, with a spirit tantalus by the members of the Lancashire and Cheshire Tramways and Transport Managers' Association, of which Mr. Buckley has been Hon. Secretary, and with a case of cutlery, fish servers and eaters, a dessert stand, forks, and a pair of hair brushes by the Bury Corporation officials.

Mr. J. C. Denison-Pender has been elected chairman of the Eastern Telegraph Co., the Eastern Extension, Australasia, and China Telegraph Co., and the Western Telegraph Co. Mr. Denison-Pender is the elder son of the late Sir John Denison-Pender, the former chairman of the Eastern and Associated Telegraph Companies. He was appointed a director of the Eastern in 1906, became joint managing director with Admiral Grant in 1923, and vice-chairman in 1925. He is chairman of the four West India cable companies recently acquired by the Eastern group.

Obituary.

MR. R. J. CARTWRIGHT, electrical and lighting engineer, of 4, Plashet Grove, Upton Park, Essex.

MR. WILLIAM LANGLEY WILCOX, aged 42 years. He was the electrician at Marlborough College.

MR. JOHN WILLIAM VEALE, aged 55 years. He was for a considerable period with Crompton Parkinson, Ltd.

MR. FREDREICK CHARLES BARTON, aged 56 years. He was in business as a wireless engineer in Ashton Street, Dunstable.

DR. LIONEL SELLS, on March 16th, aged 52 years. He lost several fingers on both hands as a result of early experiments in X-ray work.

DR. PAUL DVORKOVITZ, on March 16th, aged 72 years. He was the originator of the system of low temperature carbonisation which bears his name.

MR. JOHN HARRISON, aged 42 years. He had for about 17 years been in business as an electrical and radio engineer at 33, Lord Street, Earlestown, near Warrington.

THE E.P.E.A.

The London Local Technical Group of the Electrical Power Engineers' Association held their first social function on March 16th at the New Princes Galleries, Piccadilly, London, when 154 members and friends were received by the Chairman of the Group (Mr. W. J. Jeffery) and Mrs. Jeffery. Dinner was served in the Galleries at separate tables, and the function was unique in that there were no speeches. During the period before dinner and the intervals between the dances the members had the pleasure of a private view of the exhibition of water colour paintings and the miniature portraits with which the walls of the galleries were adorned. A splendid dance band, from the Princes Restaurant, was in attendance, and there was ample room for sitting out. This function will, no doubt, become another "annual," and, if the first is any augury for the future, the next one will fill the galleries. As befits the National Technical Group Scheme the gathering was fully representative of those engaged in the design, manufacture, erection, and running of central station plant and accessories. Messrs. Rycroft and Andrews, who were responsible for the arrangements, received hearty congratulations on the success of their efforts.

IN PARLIAMENT.

West Highland Water Power Bill Considered by Select Committee.

A SELECT Committee of the House of Lords began consideration of the West Highland Water Power Bill last week.

Mr. H. P. Macmillan, K.C., for the promoters, said it was proposed to promote a company to be called the West Highland Water Power Co., to establish a hydro-electric power station at Loch Hourn, and to use the water of the rivers Garry and Moriston and other streams and natural storage facilities provided in Lochs Quoich, Clunie and Loyne. The cost would be £2 730 000. It was hoped to attract industries to the site or make arrangements with the Central Electricity Board.

Mr. C. H. Merz gave technical details of the scheme and said the scheme would work in conjunction with the grid. The present low price for electricity throughout the country was not through the special economy of steam-raised power, but through the increased efficiency and economy in working and centralisation.

Sir Alexander Gibb said he was responsible for the carrying out of the civil engineering portion of the work. Loch Quoich would be used as the central storage base. The Loch Garry works would cost £90 000, and would take three years to complete.

Lord Meston, one of the promoters of the Power and Traction Finance Co., the promoters of the Bill, said the use to be made of the electricity would depend upon the attitude of the Central Electricity Board. If all the power was not required the promoters would try and induce suitable electro-chemical process works to start on the banks of Loch Hourn.

Mr. W. H. Armistead, a fish culturist, said he thought the scheme would give better results than nature afforded in dry weather, as it provided a steady flow of water into the lochs in the summer.

Provost A. M. MacEwan, Inverness, said the local bodies had come to the decision that the scheme would be of no benefit to the Highlands, because as far as it could be understood, the whole of the power would be used in the South.

Mr. F. W. Purse said he did not think the proposals of the Bill would serve any public benefit so far as the County Councils in the northern areas of Scotland were concerned.

Lancashire Electric Power Bill.

This Bill was before the Unopposed Bills Committee of the House of Commons on March 21st, and after evidence had been given was passed for third reading. It was explained that the total capital powers of the company were £3 000 000 with £1 000 000 borrowing powers, of which amount they had issued £2 400 000 capital and £800 000 loans. They now asked for £1 000 000 further capital and £500 000 borrowing powers, and also powers to borrow up to half the original capital. The company was extending the station at Kearsley, and the total expenditure on that station would be about £1 700 000. It had other works in hand which would involve a total of £2 200 000. Three of the company's stations were selected stations for the purpose of the Central Electricity Schemes, and the company was under obligation to extend when called upon to do so by the Board.

London Passenger Traffic.

The hearing by a House of Commons Committee of arguments and evidence in regard to the proposals of the Underground Railways Group and London County Council for co-ordination of transport facilities in the London area has been continued during the past week.

Lord Ashfield, chairman of the five companies in the Underground Group, said the setting up of a common fund and common working by those companies had been amply justified. His view of the need for co-ordination of London's traffic was expressed generally in the report of the London Traffic Advisory Committee. He would not like to suggest that the solution of the London traffic problem could not be found on the surface. If extensive widenings were made the solution could be found, but only at prohibitive cost.

Lord Ashfield referred to the insistent need for the extension of tube railways. A mile of tube railway cost, say, £850 000. He could see no solution except by co-ordination of the different forms of traffic under one management, with one common financial interest. Since the war they had spent £26 000 000 on their undertaking. He read a memorandum setting out his views as to how the common management would operate. If the Bills were passed, he said they were almost pledged to extend the tube from Finsbury Park to Wood Green, at a cost of from £4 500 000 to £5 000 000. He had no hesitation in saying they would be able to come to an agreement satisfactory to London County Council and to themselves. He believed that his companies would be prepared to leave to the Minister of Transport the decision of what was a reasonable return on the capital and the formula for determining it. He had hoped that the Metropolitan Railway would come into the scheme, but they had not yet indicated their willingness.

Mr. E. E. Charteris, K.C., for London County Council, read an abstract from the report of a special committee on tramways to which the Council, in 1920, referred the question of London traffic. The committee reported that the fact had been impressed upon it that it was impossible to effect anything like improvement until some concerted effort was made to meet the present unrestricted competition between the means of local passenger transport.

Sir John Gatti, L.C.C., described the proposals in the Bills as a beginning. What he would regard as an ideal body would be one purely representative of the local authorities. The ownership of the Council's tramways, if the Bills were passed, would still remain with the Council. He hoped that all the dissenting local authorities would come in.

Mr. Moon, K.C., for East Ham and West Ham Corporations, maintained that the municipalities should have controlling interest in the common management.

Lancashire Trolley Vehicle Scheme.

A Bill promoted by the South Lancashire Tramways Co. for authority to run trolley vehicles along the routes of the company's tramways and other routes and to run omnibuses came before a Select Committee of the House of Lords last week.

Mr. Thorpe, for the promoters, said the company had constructed 32 miles of track connecting with such important centres as Bolton, Wigan and St. Helens. They had come to the conclusion that the tramway system was out of date, and that the best thing to do was to substitute trolley vehicles, using the existing overhead standards.

Mr. Wallace said, in order to meet objections raised to the protection clause, they had decided to ask for protection along the routes of the existing trams only.

On behalf of local authorities opposing the Bill, it was submitted that there was no precedent for monopoly over such a large area and that the company's obligation to light the streets along the tramway routes should continue. The company had already powers to run buses through their parent company.

The Chairman (the Marquis of Bath) said the Committee would not allow the restriction of competition proposed in the Bill. The payment of £150 per annum to Leigh for road widening and loss on market tolls would cease, but the liability to light the district should continue.

Replies to Questions.

The results of the recent television demonstration are still under consideration, and the Postmaster-General is not yet in a position to make a statement as to his conclusions on the merits of the Baird system.

It is estimated that during the period 1870 to 1912 the total loss on the Post Office telegraph service amounted to approximately £21 800 000, of which interest charges accounted for about £12 500 000. From April, 1912, to April, 1928, the loss amounted to approximately £24 000 000, including about £5 000 000 for interest charges.

In reply to a suggestion by Sir Robert Thomas that wireless apparatus might be set to send out automatically the S.O.S. signal and the latitude and longitude of a vessel in distress, and so enable the wireless operator to endeavour to save himself when the question of saving the vessel became hopeless, Sir P. Cunliffe Lister (Board of Trade) said he would be happy to discuss the question with Sir Robert, but a difficulty was that the sending out of these automatic messages would interfere with messages exchanged with rescuing ships.

From April 1st, 1912, to March 31st, 1928, the aggregate telephone surplus, after providing for maintenance, depreciation, and operating costs, but not interest, amounted to £24 591 445. The interest charges for the same period amounted to £27 059 534. During the past few years reductions of telephone charges have been made amounting to many millions of pounds. The royalties received from the National Telephone Co. during the last three years of its operation amounted to £970 000.

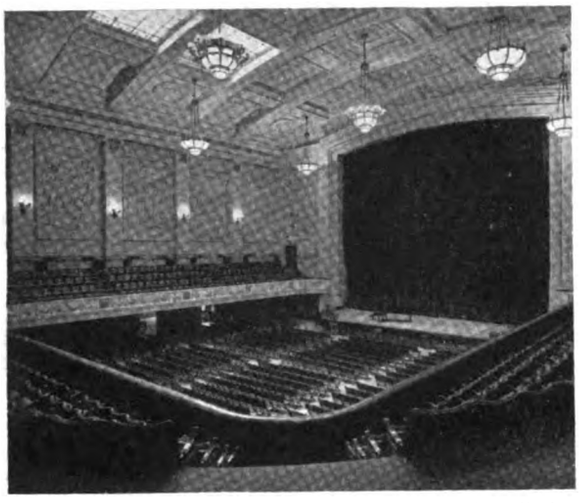
BUSINESS ITEMS.

THE address of the BRITISH SECHERON CO., LTD., has been changed to 158, Stonehouse Street, London, S.W.4.

DIXONIA, LTD., announces that all further correspondence should be addressed to Clifton Street Works, Latimer Road, London, W.11.



AN exclusive photograph of the new lighting installation at Melbourne Town Hall, carried out with Osram lamps and G.E.C. fittings.

SIEMENS BROS. AND CO., LTD., Woolwich, London, S.E., advise us that cables and wires of their manufacture are used throughout in the "Viceroy of India."

A new lamp stores and trade counter has been opened by the BRITISH THOMSON-HOUSTON CO., LTD., at Sherwood Buildings, South Sherwood Street, Nottingham.

The Radio Wholesalers' Federation has recently added the following new members to its strength: B.N.B. Wireless, Ltd., Hobday Brothers, Ltd., Simpson Baker and Co., Ltd., and the Esco Co.

To enable members of the staff to see the latest developments the WESTERN ELECTRICITY SUPPLY CO., LTD., organised a visit to the Ideal Home Exhibition, London, on March 20th. Members of the District and Branch Staffs in Wiltshire, Oxfordshire and Berkshire participated.

A British subject recently resident in Colombia is desirous of returning to Colombia with representations of British firms manufacturing electrical machinery and accessories, engineering accessories, metals, hardware, and heavy chemicals. The Department of Overseas Trade has further details. (Reference No. 150.)

When Mr. Lloyd George addressed his audience in the Albert Hall, London, on Tuesday, his words were relayed to thirteen other towns over an aggregate of more than one thousand miles of special Post Office trunk lines. The public address equipment of the MARCONIPHONE CO., LTD., 210, Tottenham Court Road, London, W.C. was used.

DAVEY PAXMAN AND CO., LTD., Aldwych House, Aldwych, London, W.C.2, point out that though only a few months ago the Ashford (Kent) U.D.C. equipped their generating station with an eight cylinder Paxman cold starting "spring injection" crude oil engine, they have just ordered a more powerful engine of the same type. This second engine will be almost identical with a 1 500 B.H.P. engine which the Basingstoke U.D.C. is about to instal.

The SYNCHRONOME CO., LTD., points out that with regard to our note on "Checking Alternator Frequency" in our issue of March 8th, it should be mentioned that EVERETT, EDGCUMBE AND CO., LTD., as chief contractors, are responsible for the linking up of the London Power Co.'s stations with a combination of the Warren frequency meter and the Synchronome system. Messrs. Everett Edgcumbe handle the Warren master frequency meters in Great Britain, as well as the Warren synchronous motors for this and other purposes.

The business of J. SMITH AND SON, heating, lighting and general engineers, of 33 and 34, North Road, and Foundry Street, Brighton, has for family reasons been converted into a private limited company. Successfully carried on by Mr. J. D. Smith since the death of his father, the late Mr. John Smith, in 1893, it will now be under the control of his brother, Mr. H. L. Smith, as managing director. Mr. J. D. Smith retires from active management, but retains a seat on the Board. The name of the firm appears in the list of members of the Electrical Contractors' Association, and on the National Register.

The new showrooms of Messrs. BEST AND LLOYD, in Great Marlborough Street, London, a photograph of which was reproduced in our issue of March 1st, is an indication of the growing importance of the electric lighting trade. Much of the originality of the front was lost in our illustration of the premises, as the lettering is red against a general scheme of black, well setting out the lights and stoves in the window. Inside on two floors is shown a wide selection of fittings, including a section of decidedly modern designs. Messrs. Best and Lloyd, apart from such recent successes as "Firelight Glass," have carried out several important lighting contracts recently, including the Royal Horticultural Hall at Westminster, and Nottingham University.

In connection with the electric light and power installations at the New Pavilion at Bournemouth, the electrical contractors, Messrs. AISH AND CO., Yelverton Road, Bournemouth, advise us that the new pavilion is the first building in Bournemouth in which a 3-phase electricity supply has been used, 200 V for lighting, 346 V for power, 100 cycles being the periodicity. The supply is taken from the mains of the Bournemouth Power and Electricity Supply Co., a special 11 000 V service into the building being provided; transformers are accommodated in a room near the Power House, whilst an emergency lighting system is provided, using 500 V d.c. to drive a motor generator producing 200 V d.c. The electric light installation consists of approximately 1 750 lamps of varying wattages from 25 to 1 000 W. The power installation consists of 32 electric motors, varying in size from 35 H.P., which drive the ventilating fans, down to ¼ H.P. for the labour saving appliances in the kitchen, totalling 270 H.P. in all.. The installation includes a passenger lift, and 4 service lifts from the kitchen to the restaurants and ball room; the kitchen is equipped with many electrically operated labour saving machines, whilst the refrigerating and soda fountains are operated on the "Frigidaire" automatic refrigeration system. The wiring is carried out in 27 500 ft. of screwed steel conduit, which was erected before the 24 miles of cables were drawn in.

ADVERTISING AND EXPORT TRADE.

Annual Dinner of the National Advertising Benevolent Society.

SIR ERNEST BENN, who was chairman on March 22nd at the 11th annual festival dinner of the National Advertising Benevolent Society at the Connaught Rooms, London, had the satisfaction of announcing that £7 050 had been raised in connection with the gathering.

Sir Robert Horne, M.P., who proposed the toast of "The Society," said he could remember the time when people who advertised largely were looked upon with suspicion. We had entirely departed from those silly old notions. A great truth lay behind the advertising profession. It was that the more goods one could sell the cheaper one could produce them. Sir Robert said the failure of British salesmanship in many instances was due to the fact that there was no proper appreciation of the state of mind of the people to whom they were appealing. Whereas before the war we had by far the largest export trade of the world—and it was necessary for us to have that, because we could not live without export trade—to-day the United States, which prided itself on its skill in salesmanship and its efficiency in advertising, was exporting three hundred million pounds worth of goods more in a year than we were. The U.S.A. export trade had grown to £1 000 000 000 annually, compared with our £700 000 000. There was great scope for new British markets in the Dominions, and he appealed to all engaged in salesmanship to take advantage of every opportunity offered of travelling to the Dominions, and to make themselves familiar with the actual needs of the people, and their attitude towards the various goods produced in this country.

Sir Ernest Benn, responding, spoke of the excellent work of the National Advertising Benevolent Society which during the past year had distributed £6 373 in relief of necessitous cases.

Sir Gomer Berry, Mr. Edgar Wallace and Lieutenant-Colonel E. F. Lawson also spoke.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

DEVIZES RURAL DISTRICT COUNCIL.—Electric light installations at 42 houses in the council's areas.

BROOK MOTORS, LTD., March 29th.—Electric lighting work in connection with extensions to Empress Works, St. Thomas's Road, Huddersfield. Plans, etc., can be seen at the offices of Mr. J. Arnley, 55, New Street, Huddersfield.

GLASGOW CORPORATION, March 29th.—Supply of poles, bases and cables, for street lighting. Specifications from the Inspector of Lighting, 20, Trongate, Glasgow.

RHONDDA URBAN DISTRICT COUNCIL, March 30th.—Supply of house service, a.c., ordinary and prepayment meters, cable joint boxes, compound, cut-outs, etc., for one year. Specifications, etc., from the Electrical Engineer, Electricity Works, Porth, Glam.

ROSSLYNLEE ASYLUM, March 30th.—Six months' supply of electrical fittings, etc. Forms of tender from Mr. C. L. Addison-Smith, 19, Heriot Row, Edinburgh.

GLASGOW CORPORATION, April 2nd.—Electric light installation in new police station of Millerston. Specification, etc., from the Office of Public Works, 64, Cochrane Street, Glasgow; deposit, £2 2s.

MANCHESTER CORPORATION, April 3rd.—Supply and placing in position at Oldham Road "B" sub-station of one 8 000 kVA forced air-cooled transformers, 32 000/6 600 V, three-phase, 50-period. Specification (No. 232) and form of tender from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, April 5th.—Supply and erection of three single-phase, 4 000 kVA transformers, to form a 12 000 kVA three-phase bank, at the Authority's West Bromwich generating station. Specification, etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

GREAT WESTERN RAILWAY, April 9th.—Supply of electrical wires and cables (list 20), telegraph ironwork (list 21), and wire-iron and steel for telegraph work, etc. (list 28). Forms of tender can be obtained from the Stores Superintendent, Swindon.

CENTRAL ELECTRICITY BOARD, April 15th.—Supply and erection of 33 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.–S.L.2) from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

DUMFRIES CORPORATION, April 17th.—Supply and erection of one water cooling tower, for the Electricity Department. Specification, etc., from Mr. W. S. Johnston, engineer and manager, Electricity Works, Leafield Road, Dumfries; deposit, £1 1s.

WEST RIDING EDUCATION COMMITTEE, April 17th.—Electric light installation at Edlinton New Middle and Elementary Schools and caretaker's house. Specifications, etc., until April 10th, from the Education Officer, County Hall, Wakefield.

Transformers for the Central Board.

CENTRAL ELECTRICITY BOARD, April 22nd.—Supply and erection of 33 000 V and lower voltage transformers. Specification (No. N.W.E.–S.T.2) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, April 29th.—Supply and erection of electricity meters, in connection with the Central Scotland Electricity Scheme. Specification (No. C.S.–S.S. 14) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

SOUTHAMPTON CORPORATION, April 30th.—(1) Steel-framed building, platform for fans, overhead bunkers, etc.; (2) two water-tube boilers, with superheaters, economisers, stokers, fans, soot blowers, etc.; (3) steam, feed water and other piping, etc.; and (4) water softener, at Electricity Works, Western Esplanade, Southampton. Specification, etc., from Mr. W. G. Turner, borough electrical engineer; deposit, £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(a) Main 33 000 V switchgear, each circuit-breaker having rupturing capacity of not less than 1 500 000 kVA; (b) auxiliary 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 500 000 kVA, with group feeder reactors, for Ironbridge power station. Specification (No. 4) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(1) One 50 000 kW turbo-alternator, with step-up transformers, etc.; (2) condensing plant, boiler-feed pumps, evaporators, etc.; (3) circulating water pumps, etc., for Ironbridge power station. Specifications (No. 2) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

DUBLIN BOROUGH COMMISSIONERS, March 29th.—Installation of motors, starters, starting switches, etc., at City Abattoir. Specifications from Mr. F. McArdle, architect, 29, Rosemary Street, Belfast; deposit £3 3s.

KAILAN MINING ADMINISTRATION, March 30th.—Supply and erection at Shanghai of two 300 kW turbo-generators. (Reference B.X. 5 714.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 2nd.—Supply of jumper rings and terminal strips (schedule C 405). (Reference B.X. 5 066.)

INDIAN STORES DEPARTMENT, April 3rd.—Supply of paper insulated cables, for 660 V and 6 600 V, respectively, with joint boxes and joint compound (order No. N. 9 530). (Reference B.X. 5 164.)

ARGENTINE MINISTRY OF PUBLIC WORKS, April 4th.—Supply of Diesel electric Titan crane. (Reference A.X. 7 583.)

INDIA STORE DEPARTMENT, April 4th.—Paper insulated, armoured cable, with joint boxes. Form of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

INDIA STORE DEPARTMENT, April 5th.—Hospital steam laundry equipment, with Lancashire boiler, electric motors, piping, etc. Form of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

SOUTH INDIAN RAILWAY CO., LTD., April 5th.—Supply of electrical materials and fittings. Specifications, etc. (5s.), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

VICTORIAN RAILWAY COMMISSION, April 5th.—Supply of rectifiers and storage batteries, for power signalling purposes (contract No. 42 549). (Reference B.X. 5 166.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission lines towers (specification 29/13). (Reference A.X. 7 401.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Supply of 22 000 V transformers (specification No. 29/17). (Reference B.X. 5 101.)

DUBLIN BOROUGH COMMISSIONERS, April 9th.—Supply and erection of electrically-driven pumping plant on site adjacent to service reservoir at Stillorgan, co. Dublin. Specification, etc., from the City Treasurer; deposit £1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 15th.—Conductor cords (No. P. and T., 151/1 319). (Reference B.X. 5 098.)

INDIAN STORES DEPARTMENT, April 16th (extension of time).—Supply of 30 kW steam engine driven generator set (order No. N. 9 538). (Reference B.X. 5 167.)

INDIAN STORES DEPARTMENT, April 16th.—Supply and erection of one 5-ton overhead electric three-motor gantry crane (order No. N. 9 536). (Reference A.X. 7 652.)

Digitized by Google

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 17th.—Supply of copper earthplates (specification 133). (Reference A.X. 7 556.)

UMTALI MUNICIPALITY, April 18th.—Supply of line sundries, switchgear and transformers, in connection with extensions of electricity undertaking. (Reference B.X. 5 142.)

UMTALI MUNICIPALITY, April 18th.—Supply of 1 000 kW turbo-alternators, spray cooling plant, switchgear and crane (contract B). (Reference B.X. 5 145.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, April 25th.—Supply of three electrically-driven wheel lathes (tender No. 1 410). (Reference A.X. 7 621.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

STATE ELECTRICITY WORKS, MONTEVIDEO, May 6th.—Supply of electric cables and accessories. (Reference B.X. 5 178.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, May 15th.—Supply and erection at Government Printing Office, Cairo, of 120 kW d.c. Diesel electric generating set, with foundations, artesian well, electrically-driven water cooling pump, etc. Forms of tender, etc. (10s. 6d.), from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

VICTORIAN RAILWAY COMMISSION, May 15th.—Supply of one geared three-phase electric winding engine (contract No. C.M. 778). (Reference A.X. 760.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, May 16th.—Supply and installation of electric signalling apparatus at Johannesburg. (Reference B.X. 5 165.)

TANGANYIKA GOVERNMENT, June 1st. — Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

PORTSMOUTH CORPORATION.—Johnson and Phillips, supply of cable, £1 480.

ORSETT GUARDIANS.—Grays Electrical Co., electric wiring at the Institution, £762.

STOKE-ON-TRENT CORPORATION.—A. Reyrolle and Co., Ltd., supply of switchgear, £2 046.

DEWSBURY CORPORATION.—Ferguson, Pailin, Ltd., supply of h.t. switchgear, etc., £1 143. (Recommended.)

BEDFORD CORPORATION.—Siemens Bros. and Co., Ltd., supply of cables for 12 months. (Recommended.)

WREXHAM RURAL DISTRICT COUNCIL.—Ll. Pritchard, wiring houses on various sites, £1 011. (Recommended.)

DEWSBURY CORPORATION.—Power and Lighting Cables, Ltd., l.t. cable, £1 100; W. T. Henley's Telegraph Works Co., Ltd., e.h.t. cable, £1 495.

CAPE TOWN CORPORATION.—A. Reyrolle and Co., Ltd., switchgear, in connection with bulk supply to Tiger Oats Co., Ltd., £1 027 15s. (Recommended.)

IRISH FREE STATE, LOCAL GOVERNMENT AND PUBLIC HEALTH DEPARTMENT.—Siemens Electric Lamps and Supplies, Ltd., six months' supply of various types of Siemens electric lamps.

PRESTON CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply and erection of 6 600 V switchgear, to control two Preston and Blackpool transmission lines at Ribble power station, £5 325. (Recommended.)

COLCHESTER CORPORATION.—W. H. Allen, Sons and Co., 3 750 kW turbo-alternator, etc., £11 500, and Babcock and Wilcox, Ltd., steel cased marine boiler, etc., £10 390, in connection with extensions at the Hythe.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Hackbridge Cable Co., Ltd., supply of l.t. cable, £6 315. Also tendered:—Siemens Bros. and Co., Ltd., £6 336; British Insulated Cables Ltd., £6 451; Standard Telephones and Cables, Ltd., £6 485; Pirelli-General Cable Works, Ltd., £6 525; Greenwich Cable Works, Ltd., £7 194.

WANDSWORTH (LONDON) BOROUGH COUNCIL.—Electric lighting installation work in libraries consequent upon their conversion to the open access system:—Allfarthing Lane Library, L. J. Godfrey, £83; Putney Library, Alpha Manufacturing and Electrical Co., Ltd., £135; Streatham Library, Alpha Manufacturing and Electrical Co., Ltd., £225.

EGYPTIAN STATE RAILWAYS.—Ferranti, Ltd., transformers £564, f.o.b.; British Insulated Cables, Ltd., cable, £259, f.o.b.; English Electric Co., Ltd., switchgear, £443, f.o.b.; General Electric Co., Ltd., switchboard, £183, f.o.b.; Standard Telephones and Cables, Ltd., automatic telephone, £1 792, f.o.b. Antwerp; Ericsson Telephones, Ltd., switchboards, £4 028, f.o.b.

BASINGSTOKE CORPORATION.—Asea Electric, Ltd., transformer (£41), British Aluminium Co., conductors (£17 15s. per mile), in connection with Ash Warren extension. Midland Electric Mfg. Co., switchgear (£26 10s.), supply to Auto Tyre Service, Woking. Davey, Paxman and Co., Ltd., 800 kW heavy oil engine and alternator (£9 306), in connection with extension of generating station plant.

DUBLIN BOROUGH COMMISSIONERS.—Supply of cables and accessories for one year:—Cables—Siemens-Schuckert (Ireland), Ltd., British Insulated Cables Ltd., C. J. Vogel, and Deutsche Kabelwerke A.G.; aerial conductors, British Insulated Cables Ltd., and Deutsche Kabelwerke A.G.; section pillars and disconnection boxes, British Insulated Cables Ltd.; service boxes, W. Lucy and Co., Ltd.; cast-iron troughing, Hammond Lane Foundry, Ltd.

LONDON COUNTY COUNCIL.—Eons Electrical Co., wiring and fittings for electric lighting at Coroner's Court, Bethnal Green, and Weights and Measures Office and Coroner's Court, Clapham, £189. Other tenders:—G. J. Thornton Alder and Co., Ltd., £200; F. R. Skeels, £205; J. Vigor, £205; A. V. Gifkins and Co., Ltd., £243; J. Briggs (Electrical Contractors), Ltd., £248; Harden and Chinery, £250; Harland and Wolff, Ltd., £250; Alpha Manufacturing and Electrical Co., Ltd., £250; M. J. T. Thomas and Co., £272; Fred Hodgson and Co., Ltd., £278; N. and F. Lock, £310; A. E. Tridgell, £350; G. V. Francis, £360; J. Nicoll, £390.

CENTRAL ELECTRICITY BOARD.—Hackbridge Electric Construction Co., Ltd., and British Electric Transformer Co., Ltd., 66 kV and other transformers, in London area, under South-East England scheme; British Thomson-Houston Co., Ltd., and British Electric Transformer Co., Ltd., 132 kV transformers, under Central England scheme; British Electric Transformer Co., Ltd., British Thomson-Houston Co., Ltd., and Ferranti, Ltd., 132 kV transformers, under North-West England scheme; Ferguson, Pailin, Ltd., and Metropolitan Vickers Electrical Co., Ltd., 132 kV outdoor switchgear, under North-West England scheme. The total amount of these contracts is approximately £1 500 000.

ESSEX COUNTY COUNCIL.—Power Contracts, Ltd., wiring of the Brentwood Mental Hospital, in screwed steel conduit, with fuseboards, motors, etc., £9 674. Also tendered:—Rylands Electrical Co., £12 700; Etna Lighting and Heating Co., £12 101; W. E. Hutchinson, £13 720; Colston Electrical Co., £10 434; Mann, Egerton and Co., Ltd., £11 151; Barrow and Co., Ltd., £19 274; Electrical Installations, Ltd., £12 801; Read and Partners, Ltd., £9 239; V. G. Middleton and Co., Ltd., £12 044; A. V. Gifkins and Co., Ltd., £12 601; T. Clarke and Co., Ltd., £13 346; A. Higginbotham and Sons, £11 699; G. E. Taylor and Co., Ltd., £12 828; M. Allen (London), Ltd., £13 171; S. Dixon and Son, Ltd., £10 265; Tredegars, Ltd., £13 043; Ellis and Ward, £13 827.

TELEPHONE DEVELOPMENT.

AT the fourth annual meeting of the Telephone Development Association on Monday, the chairman, Sir Alexander Roger, referred to the propaganda methods of the Association and their satisfactory results. He remarked that during the past 12 months there had been on every single day, on the average, at least ten friendly comments on telephones in the newspapers, apart from the Association's own advertisements. Dealing with the growth of the telephone organisation, he said 1 825 new kiosks were established in 1928, making the total 6 021; between March, 1924, and December, 1928, there had been an increase of 902 exchanges, 7 841 call offices, including kiosks, and 564 091 telephone stations. They must be allowed, with all respect, to differ from the pronouncement of the Postmaster-General that even if he had had more money to spend he did not think he could have spent it economically on developing the telephone system. The programme of new construction work should be accelerated, and demand for the service should be created simultaneously by a definite policy of publicity. It was true that in the last five years we had made a larger advance on a percentage basis than any other country, but we remained tenth on the list. The report and accounts were adopted.

WORK IN PROSPECT.

AMERSHAM.—Grammar school extensions, for Bucks Education Committee. Particulars from the secretary, Mr. C. G. Watkins, Aylesbury.

BURNHAM (BUCKS).—Factory, for Slough Estates, Ltd.

BANNOCKBURN.—Housing scheme (21), for Stirlingshire County Council. Particulars from the clerk, Mr. Thomas Lupton, Stirling.

BRIGHTON.—Cinema theatre to cost £160 000, for the Associated British Cinemas, Ltd.

CHURCH STRETTON.—Houses (18), for the Urban Council. Particulars from the contractors, G. and H. Jones, Cartref, Gwaenysgor, Prestatyn.

CONNAH'S QUAY.—Housing scheme, for the Urban Council. Particulars from the architect, Mr. S. H. Garratt, Chester Road, Shotton.

DUKINFIELD.—Housing scheme (86), for the Town Council. Particulars from the Borough Surveyor.

HARPENDEN.—Housing scheme (50) for the Urban Council. Particulars from the Surveyor.

HERTFORD.—Business stores, Bengeo, for the Enfield Highway Co-operative Society. Particulars from the Secretary.

HIGH WYCOMBE.—Houses (12), Princes Risborough, for the Rural Council. Particulars from the architect, Mr. C. H. Wright, 24, Temple Street, Aylesbury.

KINGSTON (HEREFORDSHIRE).—Houses (20), Sunset, for Mr. E. Deacon.

KINGSTON-ON-THAMES.—Extensions, Victoria Hospital, to cost £13 000. Particulars from the secretary, Mr. Oliver Parker.

KNOTTINGLEY.—Additional 48 houses, for the Urban Council. Particulars from the Surveyor.

LEWES.—Housing scheme, for the Town Council. Particulars from the Borough Surveyor.

LONGLEVENS.—School, for Gloucestershire Education Committee. Particulars from the Education Architect, Gloucester.

MARLOW.—Handicraft and cookery centre, for Bucks Education Committee. Particulars from the secretary, Mr. C. G. Watkins, Aylesbury.

MIDDLEWICH.—Housing scheme (56), for the Urban Council. Particulars from the surveyor, Mr. F. W. Stocks.

NORTH NEWTON (Taunton).—Village hall. Particulars from the secretary, Mr. John Pope, Stoddens.

OLDHAM.—Housing scheme (200), Limeside, for the Town Council. Particulars from the Borough Engineer.

PORTSLADE.—Housing scheme, for the Urban Council. Particulars from the Surveyor.

PRESTON.—Infants' school, Ribbleton Avenue, for the Town Council. Particulars from the borough engineer, Mr. W. Platt.

ROTHERHAM.—Housing scheme (300), Herringthorpe site, for the Town Council. Particulars from the borough engineer, Mr. Vincent Turner.

SOLIHULL.—Housing scheme (14), Shirley, for the Rural Council. Particulars from the Surveyor.

SOUTH MIMMS.—Housing scheme (118), for the Rural Council. Particulars from the architect, Mr. G. Simcox, Bearwood, The Causeway, Potter's Bar.

STIRLING.—Housing scheme (16), for the Town Council. Particulars from the burgh engineer, Mr. A. H. Goudie.

ST. ALBANS.—House for master and matron, for the Board of Guardians. Particulars from the architect, Mr. H. F. Mence, 43, Upper Lattimore Road.

ST. COLUMB.—Housing scheme (26), for the Rural Council. Particulars from the Surveyor.

STAFFORD.—Police station, to cost £11 000, for the Town Council. Particulars from the Borough Surveyor.

STOURPORT.—Houses (200), for the Housing and Town Planning Trust.

SUTTON-IN-ASHFIELD.—Housing scheme (50), for the Urban Council. Particulars from the architects, Warner, Bocock and Dean, Mansfield Road.

SWINDON.—Chapel, for the Board of Guardians. Particulars from the contractor, Mr. Smith, Parva Hinton.

TILEHURST (READING).—Church, Norcot Estate. Particulars from the architect, Mr. A. H. R. Tenison, 21, Great Peter Street, Westminster.

TRURO.—Housing scheme (18), for the City Council. Particulars from the city engineer, Mr. F. A. Barnes.

WARWICK.—Houses (16), Cubbinton and Whitnash, for the Rural Council. Particulars from the contractors, Johnson and Newton.

TRADE PUBLICATIONS.

"RINGSDORF" carbon brushes and brush holders are the subject of a new issue by RINGSDORF-CARBONS (ENGLAND) LTD., Colindale Avenue, London, N.W.9. The booklet consists of some fifty odd pages and is well illustrated.

G. P. DENNIS, LTD., 66, South John Street, Liverpool, have published two special lists illustrating the "Desco" pressure contact self-aligning fuses, covering H.O. porcelain totally enclosed types up to 100 A, and switchboard mounting types up to 200 A.

A new publication by the E.D.A. for window display purposes.

Three adhesive window bills dealing with h.t. batteries, moving coil, loud speakers, and the deferred payment scheme have been issued by the MARCONIPHONE Co., LTD., of 210/212, Tottenham Court Road, London, W.1.

A new descriptive catalogue of Wild-Barfield industrial electric furnaces has been published by WILD-BARFIELD ELECTRIC FURNACES, LTD., Elecfurn Works, North Road, London, N.7.

BRITISH INSULATED CABLES LTD., Prescot, Lancs., have issued a pocket volt calculator, which gives at a glance voltage drop in respect to length of cable, size of cable in respect to voltage drop and similar information. The device is worked on the slide rule principle.

List BA/V-BB/V, dealing with Vicma and Vinazo wires and cables, has been published by W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1. List BC/V, dealing with the same subject, has also been published. Both these issues are for binding in the binder already issued by the company.

WIRELESS PICTURES (1928), LTD., Dorland House, 14/16, Regent Street, London, S.W.1, have published in leaflet form full particulars of the components required for the construction of a "Fultograph" picture receiver. A leaflet devoted to the electro-magnetic clutch used in these receivers has also been published.

The SUN ELECTRICAL CO., LTD., 118/120, Charing Cross Road, London, W.C.2, has published the second edition of the general catalogue of electrical supplies, apparatus, and appliances. In the accessories section of the issue in particular, the company's policy of naming alternative makes for similar articles is most marked. Another interesting point is that of the 576 pages of listed goods, 82% of the items mentioned are manufactured in this country. It will be understood that the general catalogue is distinct from the same company's electric lighting fittings and radio lists, which are issued as separate volumes.

FALK, STADELMANN AND CO., LTD., 83/93, Farringdon Road, London, E.C.1, has published catalogue No. 612 concerning lighting fittings, and No. 613 dealing with glass shades. The former of these publications is a well-produced reference on current forms of lighting, including "architectural" designs, vellum shades, bowls, and so on. Part of the catalogue is devoted to radio, while another gives the "Efes-code" for sending cables in connection with the items listed. In all, the catalogue consists of 243 pages and is well illustrated. In cases where the fitting or shade includes considerable detail, the reproduced photographs are large, while in every case the description is ample.

ELECTRICITY SUPPLY.

Hire and Hire-Purchase at Lichfield—South-East England Transmission Lines—Stretford Extensions—L.C.C. School Lighting—Irish Free State Electricity Board Acquires Existing Undertakings—Glasgow Economy Scheme.

GLASGOW Electricity Committee has authorised mains extensions at a cost of £5 676.

Upholland U.D.C. has given its consent to the application by the Wigan T.C. for a Special Order to supply and distribute electricity within the urban area.

Pocklington U.D.C. has decided not to oppose the application of the Holderness Trust, Ltd., for an Order to supply electricity within the Council's area.

Preston Electricity Committee has adopted a proposal to construct an additional water inlet for condensing purposes at Ribble power station, and to borrow £52 000 to cover the cost.

The Aldershot Gas and Electricity Co., which has acquired the Hindhead electricity undertaking, has applied to Farnham R.D.C. for permission to cross the Council's district between Farnborough and Hindhead, by means of overhead and underground electric cables.

Lichfield T.C. has applied for a loan of £2 990 for overhead cables to give a supply of electricity to Shenstone.—Sanction has been received to a loan of £2 100 for wiring installations on the hire-purchase scheme, domestic apparatus for hire, and additional testing instruments.

The first portion of the new high-pressure grid lines for the South-East England electricity scheme has been completed between Bedford and Little Barford, and will be used shortly. This section of the transmission system is ten miles in length, and consists of four cables supported by steel towers varying from 66 ft. to 83 ft. in height.

Dunoon T.C. has confirmed agreement with Messrs. Johnson and Phillips, Ltd., under which the company will establish an undertaking to supply electricity within the burgh. Power has been granted the company to negotiate with the Electricity Commissioners to obtain a Special Order. The maximum rates for electricity agreed upon are 8d. per kWh for lighting, 3d. for heating, and 4d. for street lighting.

Stretford Electricity Committee is considering the purchase of a new 288 tube economiser.—The Committee has authorised the overhauling of the blading of a turbine at a cost of about £1 000.—The Central Electricity Board had approved tenders amounting to £80 000 for high-tension cables, transformers and switchgear and approved the purchase of 1 369 square yards of land for the erection of a station as an extension of Moseley Road sub-station.

Machynlleth U.D.C., after considering electricity schemes submitted by Crompton, Parkinson, Ltd., and the Electric Development and Securities Trust, Ltd., has decided to ask the latter if it is prepared to proceed with the Order applicable to the town, independent of the support of other authorities mentioned in the Order, and also whether, in the event of sanction, it would be open to the Council to arrange terms as to overhead and underground mains.

Oxford Electricity Committee recommends that it be authorised to carry on proceedings in order to secure compliance with the notice served on the Oxford Electric Co., Ltd., requiring the company to sell its undertaking, and to engage such expert assistance as may be required for that purpose. The Committee is advised by Counsel that the Corporation will be entitled to the income of the company from the date of the service of the notice, unless a different date is fixed by agreement.

In a report on school lighting, London County Council Education Committee states that the benefits given by electric lighting, such as increased cleanliness, convenience and improved health conditions, justify electric lighting wherever it can be installed, economically, in new and remodelled schools. Having regard to the cost of installation, however, a general change-over to electric lighting in existing schools can hardly be regarded as practicable whilst prices remain substantially as they are to day.

Bedford Electricity Committee reports that it is necessary to lay cables and carry out such works as will allow of the l.t. network being sub-divided into smaller areas. It is also necessary to provide additional transforming sub-stations in various parts of the town, most of which to be fed from a new Scott bank sub-station. The cost would be for buildings, £1 450; underground mains, £4 800; and sub-station equipment, £3 650.

The St. James and Pall Mall Electric Light Co. has informed Westminster City Council that great difficulty has been experienced in obtaining suitable premises for sub-stations necessitated by the change-over from the d.c. to the a.c. system, and has asked the Council's permission to construct five sub-stations under the carriageways or footways of certain streets, with small kiosks above ground for ventilation or drainage purposes. The Highways Committee recommends that the Council disapprove the proposal.

The Irish Free State Electricity Supply Board has given notice of its intention to acquire as from March 28th, the Dublin, Clonmel, Rathmines, Thurles, Pembroke and Swinford municipal electricity undertakings. It is stated that the price of current to consumers will not be adversely affected. Other local authorities' undertakings acquired to date are: Dun Laoghaire, Bray, Limerick, Waterford, Wicklow, Wexford, Enniscorthy and Edenderry. There remain in the Free State four local authority electricity undertakings which have not as yet been acquired, viz., Ballaghadereen, Navan, Kildare and Dundalk.

Regulations dealing with installations at premises licensed for public entertainments were drawn up by Mr. A. M. Sillar for Middlesex County Council and adopted by the Council in June, 1925. Since that time developments have taken place in the use of electricity, particularly in connection with Neon signs and talking picture installations, and the Licensing Committee is of opinion that the regulations should now be revised. Mr. Sillar is prepared to undertake this work at a remuneration of three guineas an hour for the time spent, his total fee not to exceed sixty guineas. The Committee recommends that Mr. Sillar be engaged to carry out the work.

Glasgow Electricity Committee has approved a report by Mr. H. Bell, general manager of the Electricity Department, giving details of a proposed reorganisation of the Department, by which it is believed substantial economies can be effected without sacrificing efficiency. Mr. Bell states that it is estimated that savings in capital expenditure in respect of wages will amount to £31 000 and of materials to £149 000, while the saving in revenue expenditure, in respect of wages, material, debt charges, rates, etc. will amount to £40 000. A proposal in the report is that a sales manager be appointed, to co-ordinate with the existing technical staff and relieve them of many of their present duties, and to pay special attention to the development of the industrial load.

Portsmouth Electricity Committee has had under consideration the question of providing an additional main transmission line to supply electricity to the district outside the Island of Portsea. The Engineer reports that it would be most advantageous for the proposed relief main to be taken to the Corporation's existing sub-station at Emsworth. The land to the south of the Southern Railway offers no serious obstacle to the erection of overhead lines from Portsmouth to Bedhampton, nor do the northern shores of the harbour from Bedhampton to Emsworth, and it is proposed to erect overhead lines on these sections. The Committee recommends application to the Minister of Transport and the Electricity Commissioners for their consent to the carrying out of the work, and to the borrowing of £28 000.

Hornsey Electricity Committee has been informed by the Electricity Commissioners that the Commissioners are not satisfied that the corporation would, if consent were given to its extension proposals, be in a position to give a supply of electricity adequate in quantity and regularly to meet the present and prospective demands of the consumers at a cost not greater than that at which it could give a supply if it obtained a supply of electricity from the London and Home Counties Joint Electricity Authority. The Commissioners have accordingly decided to refuse their consent. The Committee is advised that the Commissioners, after designating the Central Board as the alternative source of supply, have no power to act as they propose, and the Committee therefore recommends that any necessary steps should be taken for the protection of the Council's legal rights.—The Committee proposes to instal a 300-kilowatt motor-converter at the Highgate sub-station at a cost of £3 076.

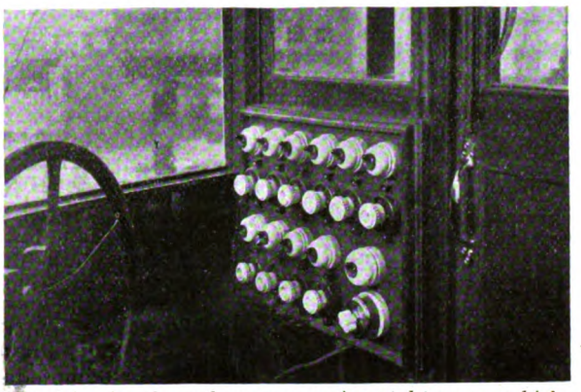
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

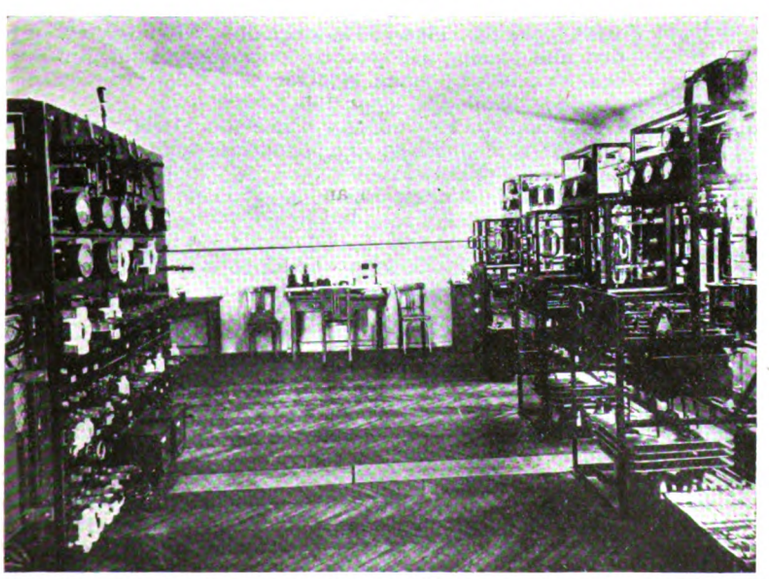
Mr. R. H. Palmer, who has become engaged to Miss Muriel Cracknell. Mr. Palmer is principal of Palmer's Publicity Service, and handles the advertising of several electrical firms.



The driver's cab on the new experimental tramcar which, when licensed, will be put into service on the Metropolitan (London) Electric Tramway Company's lines. The new car is the result of public suggestion and criticism, and experience gained from the two previous experimental cars, "Bluebell" and "Poppy," put on the road some two years ago.

Mr. Richard H. Fox, the recently appointed secretary to the Central Electricity Board. He was formerly solicitor to the Board, a position which he will still hold, jointly with that of secretary.

Two views of classes in the use of domestic electrical appliances in one of the elementary schools in Barnsley. Eight such schools have been equipped with a total of 12 electric cookers, 15 electric wash boilers, and 130 electric irons, whereby the scholars receive instruction in their uses. The knowledge thus gained can be easily applied to their home life, the Corporation wiring schemes having brought electricity supply within the reach of all residents.



The new broadcasting transmitter at Belgrade, a Marconi 9 kW installation, began regular daily transmissions on Sunday, March 24th, signals being well received in England. The whole of the transmitting station (left) is in the centre of Belgrade in the Academy of Sciences, and three studios are used. The aerial is suspended between masts approximately 80 ft. high, erected on the top of the building, and the transmitter works on a wave length of 452 metres with an aerial energy of about 2 kW. The right-hand picture shows the interior of one of the studios used for talks.

COMPANY NEWS.

Quiet Market in Electrical Securities—Waygood-Otis Satisfactory Record—Chairman of T. C. & M. Co. on Loaded Cables—British Insulated Cables Share Bonus—Directors' Reports and Dividend Announcements—New Companies.

WITH the approaching Easter holidays the market for electrical shares—supply, transportation, equipment and telegraph—has relapsed into a more or less lethargic condition, and our usual list of share quotations shows few alterations compared with a week ago. General Electric shares have reacted to some extent after their last sharp advance, and are now quoted somewhat below £3. Eastern Telegraph ordinary stock is near 270 again, and Marconi's, both Wireless and Marine, are also firmer. Several electricity supply shares—County of London, Kensington, London, and Yorkshire—are slightly lower.

WESTERN TELEGRAPH CO., LTD.—Div. of 5s. p. sh., tax free, in respect of qrtr. ended Dec. 31, 1928, payable March 11.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—Fin. div. of 7% recommended on ord. shs. for 1928, makg. 10% for year (agst. 7½%).

POWER CORPORATION OF CANADA.—An issue is being made of $10 000 000 series B 4½% 30-year convertible debs. at $100 and accrued int.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Fin. div. of 5½% recommended on ord. shs., makg. 8½% for year 1928 (same as previous year).

SOUTH METROPOLITAN ELECTRIC LIGHT AND POWER CO., LTD.—Fin. div. of 5½% recommended on ord. shs. for 1928, mkg. 8½% for year (same rate as in 1927).

J. STONE AND CO., LTD.—Net pft. for 1928, £243,459, plus £128 388 brt. in. After provisn for pref. div., £50 000 is being placed to res., ord. div., 20%, agst. 15%; fwd., £162 767.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION LTD.—Net pft. for 1928, £154 460, plus £9 128 brt. in. Further div. of 5½% recommended on ord. shs., makg. 8% for year. Fwd., £24 549.

EGHAM AND STAINES ELECTRICITY CO., LTD.—Pft. for 1928, £32 661, agst. £29 507. After providg. for loan int. and pref. div. and placing £10 562 to depreciatn. acct., div. of 7½%, less tax, is recommended on ord. shs.

MID-CHESHIRE ELECTRICITY SUPPLY CO., LTD.—Pft. for 1928, £9 254, plus £1 609 brt. in. Div. 5% (same as last year); written off new issue exes., £500; to employees' div. bonus acct., £350. Fwd., £1 833.

RADIO CORPORATION OF AMERICA.—This co. recently announced the formation of a subsidiary, called the Radio Corporation of America Communications, Ltd., which will take over its communication business, except ship-to-shore.

DIRECT SPANISH TELEGRAPH CO., LTD.—Directors recommend divs. for year 1928 of 10% on pref. shs. less tax, of wh. div. for half year was paid on Oct. 1 last, and 10%, tax free, on ord. shs., of wh. intm. div. of 4% was also paid on Oct. 1.

BRISTOL TRAMWAYS AND CARRIAGE CO., LTD.—Rev. for 1928, £1 145 473. Workg. and gen. exes. and renewals amtd. to £1 033 203. Fin. div. on ord. shs. 4%, less tax, makg. 7% (same as last year); to res. for contingencies and renewals, £15 000. Fwd. £3 786.

INTERNATIONAL AUTOMATIC TELEPHONE CO., LTD.—Earnings for 1928, £130 823, agst. £124 369. Fin. div. on ord. shs., 6½%, makg. 10% for year, plus 2½% bonus, less tax; div. on dfd. shs., 10%, plus 2½% bonus. To res., £10 000. Fwd., £69 734, agst. £59 592.

CLYDE VALLEY ELECTRICAL POWER CO.—Blce. of pft. for 1928, £304 296, plus £84 290 brt. in. After paymt. of pref. div. and placing £120 000 to contingency fund, fin. div. on ord. shs. is 5%, makg. 8% for year. To benevolent fund £30 000. Fwd. £84 586.

LLANELLY AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Pft. for 1928, includg. £1 279 fm. last acct., £53 704, agst. £43 652. Deb. and loan int., £14 728; to deb. stk. redemptn., £4 648; res. and renewals accts., £19 000. After paying div. on pref. shs., carry fwd. is £3 327.

BERRY'S INSULATING AND BUILDING PRODUCTS, LTD.—This co., which has been formed to acquire the sh. cap. of Berrite, Ltd., invited subscriptns. last week for an issue of 528 000 ord. shs. of 5s. each at par. In addition, 172 000 shs. will be issued credited as fully paid up.

ERICSSON TELEPHONES, LTD.—Net pft. for 1928, £31 011, increase £4 006, plus £18 223 brt. in. Pft. on tradg., etc., £59 313, agst. £60 014. Div. at rate of 5%, less tax, on ord. shs. (same as last year); to res., £5 000; fwd., £18 235. Orders in hand show increase over last year.

WASTE HEAT AND GAS ELECTRICAL GENERATING STATIONS, LTD.—Net pft. for year endg. Jan. 31, 1929, £28 470, agst. £28 348, plus £15 244 brt. in. Deductg. amt. voted to charities at last mtg., £200, leaves £43 514, agst. £40 844. Div. for year, 8%, includg. intim. div. paid in Aug., 1928. Fwd. £17 914 agst. £15 244.

FOLKESTONE ELECTRICITY SUPPLY CO., LTD.—Pft. on rev, accts. for the three undertakings (Folkestone, Sandgate, and Hythe) for 1928, after paymt. of tax, £40 781, plus £2 046 brt. in. After provisn. for deb. stk. int., pref. div.

and bonus to staff and employees, blce. is £39 019. To depreciatn., £11 249; to res., £8 000; and to employees' superannuatn. fund, £1 000. Div. on old ord. shs., 6%, tax free, making 10% for year, and on new ord. shs. at rate of 10% p.a., tax free. Fwd. £1 894.

ASSOCIATED TELEPHONE AND TELEGRAPH CO.—Divs. payable on April 1: on 1st pfd. stk., qrtrly div. of $1·75 p. sh.; on class D stk., qrtrly div. of $1 p. sh.; on class A stk., qrtrly. div. of $1 p. sh.; and on class C stk., qrtrly. div. of 75 cents p. sh.

Company Meetings.

DAVIS AND TIMMINS, LTD.—At the meeting on March 14th, Mr. F. Le Neve Foster, chairman, said the policy of concentrating upon a reduction of cost of production by the installation of modern machinery had been continued, and the directors felt that the company was in possession of an installation of automatic machinery second to none in their trade. The accounts showed a handsome net profit of £23 417, after providing for depreciation and management commission. The board proposed a balance dividend on the ordinary shares at the rate of 16¼%, making 20% for the year. He looked forward to the future of the company with greater confidence to-day than at any time during the period in which he had been chairman. The report was adopted.

ENFIELD CABLE WORKS, LTD.—The Earl of Verulam, presiding at the meeting on March 20th, said the winter trade during the past year did not come up to expectations. Repairs and renewals at the new Harrow branch were charged to revenue, and a large expenditure for dilapidations of certain parts of their premises helped to increase the adverse balance. They were shortly opening new branches at Reigate and High Barnet. Mr. Wm. Cooper, managing director, said financially he thought they had cause for congratulation. The total indebtedness was £130 000, against £212 500 in 1925, and they had liquid assets, £34 000, against £10 400 in 1925. If their overhead expenses were divided over more branches, it might mean the difference between loss and profit to those branches. The report and accounts were adopted.

CITY OF LONDON ELECTRIC LIGHTING CO., LTD.—Mr. J. B. Braithwaite, presiding at the meeting on March 20th, said the Electricity Commissioners had fixed the company's standard price to private consumers at 3·069d. per kWh, and for street lighting at 0·794d. They had added to special reserve £86 651, making the total £185 095. In 1921 the average price charged was 4·37d. per kWh, and this had been gradually reduced to 2·23d. in 1928—a reduction of 49%. It was interesting to point out that this reduction of 49% compared with a reduction of 38·57% in the case of the gas companies in the period 1920–28. There had been an increase of 4 768 kW in their connections during the year, raising the figure to about 100 000 kW; an increase of over 8 000 000 kWh in their sales; an economy of £32 595 in their generating and distribution expenses; an addition of £45 989 to their reserves available for capitalisation; and after adding £11 831 to the benevolent fund, £2 830 to the provident fund, making the necessary allocation to the "A" and "B" sinking funds, setting aside £31 694 for the co-partners, providing the statutory dividend of £120 000 for the ordinary shareholders, and adding £9 250 to the contingency fund, they were still able to carry forward £7 656. The report and accounts were adopted, and a dividend of 10% on the ordinary shares was approved.

LONDON AND SUBURBAN TRACTION CO., LTD.—Lord Ashfield, presiding at the meeting on February 26th, said the number of passengers carried on the three tramway systems controlled by the company amounted to 193 millions in 1928, an increase of nearly 7%. But while in 1922 the average fare paid per passenger was nearly 2d., in 1928 it was only 1½d., and that made a lot of difference in the results. Outstanding reasons for the increase of passengers were that the tramways had afforded the public better service, and that the areas served by their tramways were on the outskirts of London, and had benefited under the intensive housing programmes of these last years. With regard to the proposals submitted to Parliament by the London County Council and the Underground group of companies for a co-ordination of the local passenger transport facilities within the London traffic area, they would look to play their part in such a scheme. They would claim for their tramways equal and fair treatment under such a scheme with other tramways. Only by a common management, capable of surveying and planning to cover the whole field of transport, and by a common fund capable of equalising the financial burdens and gains for all interests could undivided attention be given to fulfilling the purposes of a transport system which was to meet the needs of the passengers; only by such means could a margin of resources be secured which would allow of the steady expansion of the facilities provided.

WAYGOOD-OTIS, LTD.—Mr. H. C. Walker, presiding at the meeting last Friday, said the rebuilding of their factory had been completed, and, as a lift factory, it was, they believed, superior to any in Europe. Developments in gearless electric machines were very rapid, culminating in 1924 in the automatic signal control lift, combined with micro drive, or self-levelling, which to-day was the highest form of lift machine for intensive service. They were constructing lifts with signal control for the Westminster Bank, Ltd. There was a further adaptation of control known as collective automatic control,

A PANORAMIC view of the square and environments of Palmerston North, N.Z., where Turnbull and Jones, Ltd., electrical engineers and contractors, of Wellington, N.Z., were responsible for the electrical reticulation of the town, the work for which commenced in 1924. In the aggregate there were used 392 970 yards of cables, comprising Henley Class "A," Class "G," Class "DDD" and Class "BC"; 13 422 yards of twin, three and four-core underground cables; 120 tons bitumen; 920 lb. assorted binding wire; 22 lb. indiarubber strip; 156 lb. black tape; 2 100 lb. joint box compounds; 364 various joint boxes; 37 terminal boxes; 8 manhole network boxes, and 450 fuse boxes. Among the important wiring installations carried out by Messrs. Turnbull and Jones during recent years may be mentioned the Henley wiring system fire alarm installations in the Featherstone Street Post Office, Wellington, and the Auckland public library and art gallery; and installations in the Wellington Grand Opera House; the National Bank of New Zealand in Auckland; the Auckland War Memorial Museum; the Dunedin City Corporation's new gas retort house; and Knox College, Dunedin.

Digitized by Google

which ensured level landings under all conditions, thereby permitting speeds up to 450 ft. per minute. They were building lifts with this type of control for the Royal London Mutual Insurance Co. and others. Department store control was another form of automatic operation, intended for stores and other service, where stops were always made at each floor. They installed four such lifts for Messrs. Harrods in 1925, and had just received a repeat order from them for six similar lifts. Hitherto, in this country, electric supply for power purposes in most cases had been direct current, but it was the policy of the Central Electricity Board to convert this gradually to a universal system of alternating current. This change had necessitated many alterations in design and manufacture of lift apparatus. The company had given this matter serious attention, and had actually supplied a large number of installations for speeds up to 400 ft. per minute on alternating current, which were giving complete satisfaction. The report was adopted, and a final dividend of 7½% on the ordinary shares, making 10% for the year, was declared.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO., LTD.—The Earl of Selborne, presiding at the meeting on March 21st, said the net profit for 1928 was £106 144, plus £112 618 brought forward from previous year. Interim dividend of 2½% was paid on July 12th, 1928. It was proposed to distribute a further dividend of 7½%, tax free, to add £15 000 to reserve, and to carry forward £114 123. Loaded cables had fully proved their worth, and their great capacity for disposing of traffic had enabled the American Transatlantic cable companies to introduce the cheaper rate of 1½d. a word across the Atlantic. If the anticipated increase in the use of letter telegrams became general the demand would come for more fast-working cables of high capacity. This had been fully recognised by the Western Union Telegraph Co., the pioneers of the loaded cable, and for whom the company manufactured in the autumn a cable that, in addition to high speed, was capable of being duplexed. Research work had now definitely established the fact that a long loaded telegraph cable of the ordinary type of construction could be adapted not only for telephony but for the far higher requirements of facsimile telegraphy, and they had developed a method of dealing with their usual gutta-percha insulating material whereby its electrical characteristics rendered it of extreme value for these purposes. The International Standard Electric Corporation had favoured them with an order to lay two cables with this improved insulation, one between Tenerife and Gran Canaria and the other between Algeciras and Ceuta. If reliability was important for telegraph work, it was still more essential for communications by telephone, as people could not afford to wait for their telephone calls when interruptions occurred due to periods of fading, and it was the cable alone which in any form of transmission provided continuous communication throughout the 24 hours. He also believed that the submarine cable would provide the most reliable medium for facsimile telegraphy, which was now growing out of its infancy and was likely to become the cheapest and most important form of communication in the future. There were welcome signs of a revival in the demand for new cables. The report was adopted and the dividend approved.

BRITISH INSULATED CABLES LTD.

Bonus Share Distribution—Important Contracts on Hand—Chairman on the Company's Success—Good Progress of Allied Companies.

THE 33rd ordinary general meeting of British Insulated Cables Ltd. was held on Tuesday at Liverpool.

Mr. D. Sinclair (chairman), in moving the adoption of the report and accounts, congratulated the shareholders on another successful year of trading. They would agree, he said, that the profit of £617 951, which compared with £609 242 for the previous year, was a satisfactory result. The profit, with the balance brought forward of £305 880, made a total of £923 831. After payment of directors' and trustees' fees, etc., debenture interest, preference dividend, and interim dividend on ordinary shares, amounting to £140 442, a disposable balance remained of £783 389. Allowing for the transference of £100 000 to depreciation account and £299 966 to reserve account, the balance available for dividend was £383 423. From this was recommended a further dividend of 10% on ordinary share capital, making, with the interim dividend already paid, a total distribution of 15% for the year, and leaving £250 089 to be carried forward.

Issued share capital and debenture stock remained unchanged in the balance sheet. The reserve account, increased by last year's appropriation of £200 000, now stood at £900 000. Besides being augmented by the transference of £299 966 from trading account, the directors had brought £185 034 from investment reserve and £150 000 from special reserve, thus merging all the reserves in one group, aggregating £1 535 000. The value of property, plant and machinery, standing at £1 564 823, was an increase of £167 877 on last year.

The company's reserves now amounted to the large sum of £1 535 000, exclusive of the carry forward of £250 089. It was the opinion of the directors that this amount was in excess of the requirements of the company, and it was, therefore, proposed to distribute from this reserve to the ordinary shareholders, by way of bonus, one ordinary share free for every existing four ordinary shares held, together with 500 000 "A" 5½% preference shares of £1 each in the proportion of three such shares free for every existing eight ordinary shares held, such shares to rank for dividend as from January 1st, 1929.

The various companies in which British Insulated Cables Ltd. was particularly interested continued to do well. The Midland Electric Corporation for Power Distribution, Ltd., having distributed the bonus of share for share referred to last year, now proposed to pay a dividend of 8% on the increased capital, equivalent to 1% better than last year. The Electric Supply Co. of Victoria was in a much more favourable position, and had entered into a provisional agreement with the Victorian Government by which the whole undertaking would be sold to them in three years' time on terms and conditions fair and advantageous to both parties. The "closer working" agreement, to which he had previously referred, continued to work smoothly and satisfactorily. Valuable results had been achieved by combination in research, and these were reflected in the improvement of quality and processes of manufacture.

To the excellent staff pension fund the company had now contributed a sufficient sum to place it on a thoroughly sound actuarial basis, making unnecessary the provision of further sums beyond the regular contributory payments. With regard to the workpeople, the year had been marked by an absence of disputes and an increase in cordiality. As denoting their keen interest in the welfare of the employees, the directors recommended that £50 000 be set aside from reserves, the income from which was to be utilised to provide compassionate allowances for workpeople and their dependents.

During the last twelve months the company had fully maintained its position in the electrical world. Its products covered all kinds of electric conductors, both bare and insulated, and they were well equipped to deal efficiently with all reasonable demands that might be made upon them. The large contract recently secured to supply and lay cables in the London area for the Central Electricity Board was of a value of well over £500 000. The major portion of the cable would be for a working pressure of 66 000 V, practically a replica of their cables which had been working successfully for the past three years on the North-East coast. These were still the only cables in this country working at so high a pressure. Important contracts on hand included railway electrification in India, big transmission lines in this country for the Central Electricity Board, and in the Federated Malay States for the Perak River Hydro-Electric Power Co. The conductors for the overhead grid system in this country were of steel cored aluminium, and, in addition to supplying their own requirements for this material, they had secured large orders for the sections being carried out by other contractors.

Steel cores coated with copper were a recent development of the business. They had entered into an arrangement with an American firm to manufacture and sell material of this description known as copper-weld wire, which had the advantage of high tensile strength coupled with comparatively high conductivity, and was particularly suited for overhead line work, in which a growing business was being done in this country and abroad.

The report and accounts were unanimously adopted.

NEW COMPANIES.

S. HATHAWAY AND CO., LTD.—Cap., £1 500. Electricians, manufacturers of and dealers in wireless telephones and telephonic and telegraphic apparatus, parts and accessories, etc. Reg. office: 3, Bold Place, Liverpool.

NORTH ELECTRICAL CO. (1929), LTD.—Cap., £1 000. To adopt agreement with Sophia Miller, and carry on business of electricians, electrical and wireless contractors, factors, merchants and manufacturers at 63B, North Street, Leeds.

DORIAN WIRELESS CO., LTD.—Cap., £2 000. Merchants and manufacturers of and dealers in wireless, electric, magnetic, telegraphic, telephone and other appliances, etc. Solicitors: Kennedy, Lindo and Co., 79, Coleman Street, London, E.C.2.

ELECTRIC LAMP DISTRIBUTORS, LTD.—Cap., £500. Manufacturers, importers, exporters and sellers of electric lamps, electrical accessories, cables and commodities appertaining to electrical industries, etc. Reg. office: 55–63, Goswell Road, London, E.C.1.

ANGLO HARBIN ENGINEERING CO., LTD.—Cap., £1 000. Importers, exporters and manufacturers of and dealers in machine tools, machinery, appliances and equipments for electrical purposes, etc. Reg. office: 11, Grasmere Avenue, Stoneleigh, Coventry.

PARK ELECTRIC RADIO PRODUCTIONS, LTD.—Cap., £1 000. Manufacturers and producers of and dealers in apparatus, instruments, machines and materials for use in connection with wireless telegraphy or telephony, etc. Solicitors: Godden, Holme and Ward, 34, Old Jewry, London, E.C.

J. SMITH AND SON (BRIGHTON), LTD.—Cap., £12 000. To acquire business now carried on at Brighton and elsewhere by Mary A. Smith and J. D. Smith as "J. Smith and Son," and to carry on the business of heating, lighting and electrical engineers, etc. Reg. office: 33 and 34, North Road, Brighton.

ADEY RADIO, LTD.—Cap., £25 000. To adopt agreement with Adey Wireless, Ltd., and H. W. Adey, and to carry on business of manufacturers and repairers of and dealers in portable wireless sets, loud speakers, long range receivers, cabinet receiving sets and wireless parts. Reg. office: 99, Mortimer Street, London, W.1.

CATHODE CORPORATION, LTD.—Cap., £1 000. To exploit inventions for metallising of substances of all kinds; to construct and maintain plant, installations, cables, etc., for working by electricity any railways, tramways or other works, etc. Solicitors: Slaughter and May, 18, Austin Friars, London, E.C.2.

Sound Recording and Reproducing.

MIDLAND RADIO SERVICE, LTD.—Cap., £5 000. Manufacturers of and dealers in apparatus for receiving, transmitting, reproducing or recording sounds, pictures, written or printed matter, and electrical, magnetic, radio-operated, chemical, optical and scientific apparatus, etc. Reg. office: 7, Farquhar Road, Edgbaston, Birmingham.

MOTOR LAMPS, LTD.—Cap., £21 000. To acquire certain patents and provisional patents relating to motor lamps and lens belonging to P. Allman and A. W. Pougher, to carry on business of manufacturers of, agents for and dealers in motor lamps, drawn wire electric cabling, electric lamps, etc. Reg. office: 17, Balfour House, 119, Finsbury Pavement, London, E.C.2.

POLPERRO ELECTRIC AND COLD STORAGE CO., LTD.—Cap., £6 000. To adopt agreement with liquidator of Polperro Electric and Cold Storage Syndicate, Ltd., and carry on at Polperro and elsewhere in Cornwall, the business of an electric light and power company, cold storage proprietors, etc. Solicitors: Spring and Co., 13, Henrietta Street, London, W.C.2. (Public Co.)

W. E. AMIES AND CO., LTD.—Cap., £2 000. To acquire the business of manufacturers of mouldings and synthetic materials carried on by G. L. Ackland and W. E. Amies as W. E. Amies and Co., at 36 and 38, Matilda Street, Sheffield, and to acquire from W. E. Amies a patent relating to improvements to an electric plug fuse switch and contact blocks and the like.

WM. AYRTON AND CO., LTD.—Cap., £50 000. To acquire the business of textile machinists and general engineers carried on by E. N. Baines and J. W. Schmidt at Gorebrook Ironworks, Longsight, Manchester, as "Wm. Ayrton and Co.," and to carry on same and business of mechanical, electrical and hydraulic engineers, etc. Reg. office: Gorebrook Ironworks, Longsight, Manchester.

TIDAL ENERGY, LTD.—Cap., £10 000. To carry on the harnessing, exploitation and utilisation of power from tidal waters, waves and more generally power supplied by the sea, or of waterfalls and watercourses, with the object of creating hydraulic power, the transformation of hydraulic power into electric power and the use of electric power for all purposes, etc. Solicitors: Maxwell Batley and Co., 44–6, Leadenhall Street, London, E.C.3.

BRITISH DOMINIONS POWER SYNDICATE, LTD.—Cap., £50 000. To form, promote and assist companies, syndicates and partnerships to carry on all or any of the businesses of electrical and general engineers and manufacturers, maintainers of plant for the generation, accumulation, transmission and supply of electrical energy, to carry on business as electricians, electrical engineers, etc. Solicitors: Herbert Smith and Co., 62, London Wall, London, E.C.

DAVID ROWAN (VIDRO), LTD.—Cap., £5 000. To adopt agreement with D. Rowan for acquisition of business carried on as "David Rowan and Co.," at 142A, Islington, Liverpool, and to carry on business of manufacturers of electrical, mechanical and illuminated signs, motors, generators, switches, electrical, wireless and mechanical apparatus, electrical and mechanical engineers, etc. Reg. office: 32, Imperial Chambers, 62, Dale Street, Liverpool.

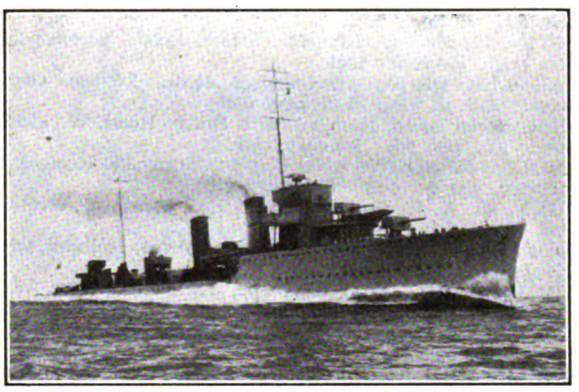
ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., Patents and Trade Mark Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.

DUNCO.—494 730. Class 6. Electri vacuum cleaning machines. Sir Duncan Watson, trading as Duncan Watson and Co., 61-62, Berners Street, London, W.1; electrical engineer.—September 5th, 1928. (To be Associated. Sect. 24.)

GILECTRA.—497 438. Class 6. Electric turntable motors for gramophones. Matthew Gill, Brunswick House, City Road, Manchester; manufacturer.—November 26th.

EXIDE.—497 299. Class 8. Instruments and apparatus for use in wireless telephony and telegraphy, and instruments consisting of a combination of a wireless receiving set and a gramophone. The Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester; manufacturers.—November 21st, 1928. (To be Associated. Sect. 24.)



THE "Serrano," one of six new torpedo boat destroyers built for Chile by Thornycroft and Co., Ltd. The installation involves nearly sixty miles of v.i.r. cable and nearly a mile of paper insulated lead sheathed ring main cable, made by Pirelli-General Cable Works, Ltd., Southampton.

MOVEX.—497 587. Class 8. Philosophical instruments, excluding thermionic valves, electric discharge tubes and similar vacuum tubes. I.G. Farbenindustrie Aktien-Geselischaft, Mainzerlandstrasse 28, Frankfort-on-Main; manufacturers. November 29th, 1928. (By Consent.)

BETA.—496 093. Class 13. Electric lamps (ordinary). John Wilson Naylor, 53, Lancaster Gate, London, W.2; manufacturer. October 18th, 1928.

Opposition to the registration of the following trade marks can be lodged up to March 29th.

EDISON.—493 476. Class 8. Electrical storage batteries, other than medical Edison Storage Battery Co., Lakeside Avenue, West Orange, N.J.; manufacturers. July 21st, 1928. To be associated with No. 311 170 (1 620) and another. Advertised before acceptance, the applicants alleging distinctiveness.

INDICTA.—492 718. Class 8. Electrically illuminated advertising signs and indicators. James McCreath, 49, Whitechapel, Liverpool; manufacturer. June 26th, 1928.

ELECTROGRAPHOPHONE.—498 568. Class 8. Philosophical instruments. Columbia Graphophone Co., Ltd., 102 to 108, Clerkenwell Road, London, E.C.1; manufacturers. December 31st, 1928. To be Associated with No. 219 222 (1 102) and others.)

CELESTIONA.—498 621. Class 8. Wireless telephonic apparatus and parts thereof Cyril French, Celestion Radio Works, London Road, Kingston-on-Thames; manufacturer. January 2nd, 1929. (To be Associated with No. 452 463 (2 433) and others.)

J.T.O.K. (monogram).—498 701. Class 8. Electric accumulators and batteries, other than medical. Julius Toubkin, 33, Long Millgate, Manchester; merchant. January 4th, 1929.

Opposition to the registration of the following trade marks can be lodged up to April 6th.

STRADONOLA.—497 086. Class 8. Sound reproducing and recording instruments and apparatus, and instruments and apparatus for use in wireless telephony and telegraphy. A. J. Balcombe, Ltd., 51, Tabernacle Street, London, E.C.2; manufacturers. November 15th, 1928. (To be associated with No. 388 533 (2 142) ix and another.)

ROTOROHM.—498 852. Class 8. Apparatus for use in wireless telephony and telegraphy. The Rotor Electric, Ltd., 34, Kingsway, London, W.C.2; merchants. January 9th, 1929.

RAMACO.—496 230. Class 8. Instruments and apparatus for use in wireless telephony. The Radio Maintenance Co., 8, Clarendon Road, Edgbaston, Birmingham; engineers. October 23rd, 1928. (By consent.)

SPEEDIX.—496 247. Class 50. Electrical insulating substances of asbestos, mica and resin. Dick's Asbestos Co., Ltd., Cory Buildings, 117, Fenchurch Street, London, E.C.3; manufacturers. October 23rd, 1928.

TENSULAM.—497 436. Class 50. Electrical insulating preparations of asbestos, mica, resin, oils or bitumen. Berry Wiggins and Co., Ltd., Halling Works, Channelsea Road, Stratford Market, London, E.15; manufacturing chemists. November 26th, 1928. (To be associated with No. 497 435 (2 653) xl.)

ZICO (sign).—497 466. Class 50. Bell pushes, bell pulls, bell push plates, ceiling rosettes, table and floor standards for electric light, switch cases, electric lamp holder adaptors, speaking tube mouthpieces, bell cases, bell indicator boards, blocks for mounting electric light switches, and candlesticks, all being goods made of wood. Alfred Feustel, trading as P. Zimmermann and Co., Deutschkatharinenberg, Germany; wood turner. November 27th, 1928.

Opposition to the registration of the following trade marks can be lodged up to April 13th.

SOPRANIST.—490 126. Class 8. Scientific instruments and apparatus. S. Kalisky (Aldgate), Ltd., 75, High Street, Aldgate, London, E.1; general merchants. April 3rd, 1928.

ELECTRONETTE.—491 858. Class 8. Scientific instruments and apparatus. The Parlophone Co., Ltd., 1, Broad Street Place, London, E.C.2; manufacturers. May 26th, 1928. (To be associated with No. 433 315 (2 354)).

YEP.—495 316. Class 8. Instruments and apparatus for use in wireless telegraphy and telephony. George Constable, 49, Ballater Road, Acre Lane, Brixton, London, S.W.2; wireless manufacturer and dealer. September 25th, 1928.

CENTROLIAN.—498 875. Class 8. Scientific instruments and apparatus. The Central Radio Co., Britannia Buildings, Fenwick Street, Liverpool; radio manufacturers and retailers.—January 10th, 1929.

GILARMONIC MAJOR. 499 230. Class 8. Scientific instruments and apparatus. Matthew Gill, Brunswick House, City Road, Manchester; manufacturer. January 21st, 1929. (To be associated with No. 495 427 (2 640) and others).

AUSTIN, C., Mr., 97, Domestic Street, Leeds, wireless dealer. £15 10s. 11d. February 18th.

CHANDLER BROS., 32, Calderon Road, Leyton, electrical engineers. £18 3s. 10d. February 6th.

JONES, Owen E, 20, Hammersmith Bridge Road, W., electrical engineer. £17 19s. 7d. January 15th.

LANGLEY MEADOWS AND CO., 31, Sunnyside Road, Ealing, electricians. £31 4s. 10d. February 7th.

LENEY, Mr. A. J., 101, Rowlands Road, Worthing, electrician. £26 12s. 7d. February 7th.

O'DONNELL, Patrick S., 40, Furnival Street, Holborn, wireless agent. £24 19s. 6d. September 11th.

PARKES, W. T., AND CO., 102, Lichfield Street, Walsall, electrical engineers. £20 17s. December 19th.

ROLFE, Mr. R. S., The Beck, Feltwell, wireless dealer. £14 1s. 10d. February 9th.

SKEELES AND LEYS, 357, Upper Richmond Road, Putney, electricians. £16 15s. 11d. February 15th.

STEREOSCOPIC X-RAYS, LTD., 67A, Baker Street, W., manufacturers and agents for electrical instruments. £20 9s. 9d. January 28th.

UPTON, Alex. Joseph, 88, Waud Street, Leicester, wireless dealer. £14 4s. 1d. February 5th.

WILKINSON, Edgar, 44, Gladstone Street, Bradford, electrician. £17 3s. 6d. February 11th.

YELDON, G., 29, New Road (or street), Portsmouth, wireless dealer. £10 3s. 6d. January 25th.

Bill of Sale.

HOLLOWAY, John Henry, 188, Northfield Avenue, West Ealing, wireless dealer. Dated March 12th, filed March 16th. £50.

Receiverships.

AXUEL TIME SWITCHES, LTD.—L. Macandrew, of 9, The Avenue, Ealing, W., was appointed Receiver and Manager, on March 11th, 1929, under powers contained in debenture date March 20th, 1928.

BELBIN AND BOWDEN, LTD.—A. C. Read, of 159, Queen Victoria Street, E.C.4, was appointed Receiver and manager on March 8th, 1929, under powers contained in debenture dated January 28th, 1929.

SAUNDERS ELECTRICAL CO., LTD.—R. B. Leech, C.A., of 23, Warwick Row, Coventry, was appointed Receiver and Manager on March 9th, 1929, under powers contained in 1st mortgage dated May 23rd, 1922.

SIDERMAN ELECTRICAL SUPPLIES, LTD.—J. Stone, of Legality, Canvey Island, was appointed Receiver on February 19th, 1929, under powers contained in debenture dated May 9th, 1927.

SUN RAY TREATMENT CENTRE, LTD. S. F. Homewood, C.A., of Monument House, Monument Street, E.C.3, was appointed Receiver and Manager on March 9th, 1929, under powers contained in debentures dated November 16th, and 23rd, 1928.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *— allowed by the date of the Summary, but such total may have been reduced.*]

HARRISON AND SEARLE, LTD., Birmingham, electricians.—Registered February 27th, £1 000 debentures to W. Tregellas, 955, Pershore Road, Selly Park, insurance manager; general charge. *Nil. September 14, 1928.

PRECISION RADIO AND MANUFACTURING CO., LTD. Woking.—Registered March 4, £100 debentures to W. C. Powers, 56, Fleet Street, E.C., paper merchant; general charge.

Satisfactions.

CLEVELAND AND DURHAM ELECTRIC POWER, LTD.—Satisfaction registered March 4th, £13,400, part of amounts registered October 23rd, 1913, and January 17th, 1919.

HORLEY AND DISTRICT ELECTRICITY SUPPLY CO., LTD.—Satisfaction registered February 27th, £1 500, registered April 16th, 1927.

RADIO SERVICE (LONDON) LTD.—Satisfaction registered March 5th, £125, part of amount registered July 26th, 1927.

SIEMENS BROTHERS AND CO., LTD., London, S.W., telegraph engineers. Satisfaction registered February 18th, £33 400, part of amount registered January 21st, 1918.

London Gazette, etc.

Companies Winding-up Voluntarily.

COLLINGE AND CORRIGAN, LTD.—By reason of its liabilities, March 16th. G. Miller, 19, Castle Street, Liverpool, Incorporated Accountant, appointed as liquidator.

KLEIN BROS., LTD.—By reason of its liabilities, March 14th. R. F. Sheppard, Chartered Accountant, 22, Martin Lane, Cannon Street, London, E.C.4, appointed as liquidator.

Partnership Dissolved.

NORMAN R. PHELP (Norman Rupert PHELP and William Reginald PALLETT), wireless engineers, 54, Queen's Road, Brighton by mutual consent, as from November 8th, 1928. Debts received and paid by N. R. Phelp.

Order Made on Application for Discharge.

WALLIS, Cyril Kenneth, electrical engineer, Bedford Street, Bognor, and then at Longford Road, Bognor. Discharged subject to judgment for £20, February 14th (paid).

Bankruptcy Proceedings.

LAWRENCE, Louis Haydn, in the petition and Receiving Order described as Henry Frederick Lawrence, trading as Henry F. Lawrence, 43, Canterbury Road, Margate, Kent, electrical engineer. The public examination herein was held on March 19th at the Guildhall, Canterbury, when a statement of affairs was lodged showing a deficiency of £484. The debtor, it appeared, commenced trading on his own account in 1923, taking his present premises in 1924. His turnover during 1928 was £1 600, but owing to the large rental, the shop did not justify itself. He estimated a gross profit of 25 per cent. on the £1,600, or £400, and his wage bill absorbed that £400. It was pointed out that the debtor was losing at the rate of £200 per annum. The examination was closed.

METAL AND CHEMICAL PRICES.

TUESDAY, March 26th.

		Price.	Inc.	Dec.
Copper—				
Best Selected ..	per ton	£105 nominal	£6 0 0	—
Electro Wirebars	,,	£113 12 6	£13 2 6	—

Sulphur—Flowers, Ton £12 0 0 ***Sulphuric Acid***—
,, Roll ,, £10 10 0 (Pyrites, 168°) Ton £6 15 0
Copper Sulphate ,, £25 to £25 10 0 ***Sodium Chlorate*** per lb. 2¾d.
Boric Acid (Crystals),, £30 0 0 ***Sodium Bichromate*** per lb. 3¼d.
Rubber—Para fine, 1s. 1¼d.; plantation, 1st latex, 11¼d.

*. The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

James Forster and Co. state that an unprecedented jump in prices was seen on Monday, the opening price being about £3 higher at £27 for March, values further advancing until £30 was paid for June with March nominal at £29 15s. The market has since been firmer again under the stimulus of the raising of the official American price from 7.25 to 7.75 cents per lb.

Closing prices on March 22nd were £28 13s. 9d. for March, and £29 for June, a rise of £4 12s. 6d. per ton on the week.

Infringement of C.M.A. Trade Mark

(Registered Nos. 422219, 422220, and 422221)

Cable Makers Association v. Edward William Knight sued and trading as City Engineers' Supply Company (a firm)—

On January 18th, 1929, in the High Court of Justice, a perpetual injunction was granted restraining the Defendant, his servants or agents from infringing the said trade mark, and the Defendant was ordered upon oath to deliver up to the Plaintiffs or destroy in their presence all infringing articles in his possession or power and to pay the Plaintiff's costs.

The Cable Makers Association are owners of the following Trade Marks:—

C.M.A.	-	Regd. Nos. 422219-20-21.
NONAZO		Regd. No. 458865.
VICMA	-	Regd. No. 486180.
VINAZO	-	Regd. No. 486179.

Licenses to use these are granted to members of the Cable Makers Association only.

Advt. of The Cable Makers Association, Sardinia House, Sardinia Street, London, W.C.2

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

305 738 H. F. Joel, Sen. Electric secondary batteries or accumulators. (21/9/28.)
305 747 H. Baron (C. Aldendorff). Automatic switches for telephone exchanges and remote control systems. (1/12/27.)
305 749 B. R. Wingfield and B. T. Wingfield. Electric thermostats. (5/12/27.)
282 115 Felten and Guilleaume Carlswerk Akt.-Ges. Manufacture of wire cables. (13/12/26.)
305 781 General Electric Co., Ltd., and R. J. Kaula. Locking devices for electric incandescent lamps or the like. (3/1/28.)
305 724 Oldham and Son, Ltd., and W. D. Wilde. Means for carrying and holding together a number of galvanic batteries. (10/11/27.)
305 799 J. Katunsky. Electric heating element. (24/1/28.)
305 802 W. S. Taylor. Manufacture of electric cables. (28/1/28.)
305 818 J. Vigneault. Radiators heated by steam generated electrically. (13/2/28.)
305 822 A. H. Marks and P. Russell (legal representatives of E. C. R. Marks (deceased). Suddeutsche Telefon-Apparate-Kabel-und-Drahtwerke. Long distance cable installations. (14/2/28.)
285 843 C. H. F. Muller A.-G. Incandescent cathode discharge tubes. (22/2/27.)
305 847 C. Bruynis. Electromagnetically or pneumatically operated main current switch. (7/3/28.)
290 564 De Forest Phonofilms, Ltd. Talking motion picture apparatus. (14/5/27.)
305 849 W. W. Nobbs. Electric heating-elements of the immerson type. (9/3/28.)
287 453 Aktiebolaget Birka Regulator. Thermostatic switches. (19/3/27.)
287 503 Spezialfabrik fur Aluminium-Spulen Und-Leitungen Ges. Producing insulating-coverings on wires, bands, plates, or sheets of aluminium or aluminium alloys. (22/3/27.)
287 937 Westinghouse Lamp Co. Electrodes for electron-discharge devices and the like. (30/3/27.)
288 518 Telffunken Ges fur Drahtlose Telegraphie. Electrical condensers. (9/4/27.)
305 875 P. J. Maffey and J. B. L. Foot. Method of and means for rectifying alternating currents. (16/4/28.)
290 667 Benjamin Electric, Ltd. Lighting-apparatus. (19/4/27.)
305 887 H. D. Symons. Insulation material for electric apparatus. (19/5/28.)
291 114 G. Haagen and Cie. Electrode-holders for electric arc-welding. (27/5/27.)
293 353 Soc. Anon. Compagnie de Produits Chimiques et Electro-Metallurgiques Alais, Froges, and Camargue. Electrolytic apparatus for refining aluminium and for like processes. (4/7/27.)
305 895 M. Hentschel and F. Muller (trading as Porzellanfabrik Hentschel and Muller). Electric suspension insulators. (22/6/28.)
291 983 L. M. Telefonaktiebolaget Ericsson. Counting-apparatus. (3/8/27.)
295 580 Westinghouse Electric and Manufacturing Co. Vacuum electric discharge tube devices. (13/8/27.)
305 910 G. G. M. Hardingham (P. Lancier). Apparatus for withdrawing underground cables. (13/8/28.)
298 578 P. Betz. Apparatus for the manufacture of electric insulating-tubes. (11/10/27.)
305 620 E. F. Northrup. Electric induction furnaces. (8/9/27.
306 158 J. L. Baird and Television, Ltd. Television or like systems. (17/8/27.)
305 956 Automatic Telephone Manufacturing Co., Ltd., and O. A. Pearce. Telephone systems. (10/10/27.)
305 957 J. A. Crabtree. Electrical switches. (12/10/27.)
306 056 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Wireless receiving sets. (15/10/27.)
306 164 J. Wilson. Producing gramophone records from wireless electrical impulses. (18/10/27.)
306 011 B. Marchini (G. Passatti). Production of insulating material. (8/11/27.)
296 660 C. H. Everett and G. R. Carr. Storage batteries. (3/9/27.)
283 193 Associated Telephone and Telegraph Co. Telephone systems. (8/1/27.)
306 014 H. Martin. Apparatus for electrically measuring fluid-flow. (12/11/27.)
306 010 A. West and Co., Ltd., and A. West. Oil-immersed electric switchgear. (14/11/27.)
300 178 A. Reyrolle and Co., Ltd., J. Mirrey and G. H. Gardner. Protective arrangements for alternating current electric circuits. (17/11/27.)
306 183 A. L. Jones. Lighting of indicating instruments on automobile and like vehicles. (17/11/27.)
289 763 Vereinigte Gluhlampen und Electricitats Akt.-Ges. Method for the production of cathodes for electric discharge tubes. (30/4/27.)

Applications for Patents.

January 31st.

3 218 Landis and Gyr. Soc. Anon. Time switch. (1/3/28, Switzerland.)
3 306 Siemens-Schuckertwerke A.G. Distribution of electric power at working face of mines, etc. (3/2/28, Germany.)
3 347 Siemens-Schuckertwerke A.G. Regulating potential in a.c. trunk lines (21/12/28, Germany.)
3 272 T. S. Skillman and Standard Telephones and Cables, Ltd. Telephone systems.

February 1st.

3 400 Associated Electrical Industries, Ltd. Relay systems for paralleling circuits. (1/2/28, U.S.)
3 460 Automatic Telephone Mfg. Co., Ltd., and J. E. Ostline. Timing apparatus.
3 432 British Thomson-Houston Co., Ltd. Electric switches. (1/2/28, U.S.)
3 493 W. A. Burns and E. I. Hicklin. Illuminated signs, etc.
3 194 W. A. Burns. Portable wireless receivers.
3 453 Celestion, Ltd., and C. French. Telephone instruments.
3 491 Cie de Forges et Aciéries de la Marine et d'Homecourt and G. Grant. Electric distant control systems. (30/3/28, France.)
3 402 E. G. and P. A. Craven. Telephonic loud speakers, etc.
3 450 A. Daniker. Electric heat regulator. (6/2/28, Germany.)
3 431 L. J. L. Debelmas. Antitheft device for electric lamps. (6/2/28, France.)
3 442 L. Flandrin and G. C. Levy. Mercury-switch. (4/2/28, France.)
3 451 L. G. S. Hebbs. Production of electrolytically deposited metal coatings.
3 434 International General Electric Co., Inc. Electric rectifiers. (1/2/28, Germany.)
3 501 H. Martin. Apparatus for electrically measuring liquid flow. (12/11/27.)
3 449 J. L. Pech. Incandescent lamps. (3/2/28, France.)
3 407 A. Schuhmann. Electric toy railways, etc.
3 479 Siemens-Schuckertwerke A.G. Regulating phase of voltage in distribution systems. (3/2/28, Germany.)
3 480 Siemens-Schuckertwerke A.G. Determining rotation speed of commutator machines. (21/2/28, Germany.)
3 417 E. H. Tarlton. Picture telegraphy, etc.
3 428 H. F. J. Thompson. Means for interrupting a.c. circuits.

February 2nd.

3 599 S. G. Brown. Means for establishing electrical contact between two oscillating bodies.
3 601 S. G. Brown. Electrical make and break devices.
3 570 H. R. Cool. Recording operation of electrical devices.
3 575 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Synchronising movements.
3 511 S. E. Foster and F. Grocott. Connector for electric radiators, etc.
3 593 A. Graves. Wireless transmitting, etc., apparatus.
3 595 International General Electric Co., Inc. (Allgemeine Elektricitats Ges.). Casing for motors, etc.
3 585 G. C. and P. A. Lundberg, A. P. Lundberg and Sons, Ltd., and G. Pegg. Adaptors for electrical installations, etc.
3 522 G. H. Neep and Switchgear and Cowans, Ltd. Electrical contacts.
3 523 G. H. Neep and Switchgear and Cowans, Ltd. Electric switchgear.
3 603 Siemens-Schuckertwerke A.G. Lead-sheathed submarine cable. (25/2/28, Germany.)
3 577 R. W. Strawson. Radiators for cooling transformers.
3 589 C. C. Turner and Young, Osmond and Young, Ltd. Means for electrically connecting together electric heaters.
3 528 R. L. Woosnam. Electric control of starter motors of moter-cars

February 4th.

3 621 J. E. Allan. Insulators for wireless apparatus.
3 618 American Fire Prevention Bureau. Thermionic circuit controlling device. (11/4/28, U.S.)
3 748 J. L. Baird and Television, Ltd. Television apparatus, etc.
3 619 W. T. Barnes. Carrier for accumulators, etc.
3 704 British Thomson-Houston Co., Ltd. Circuit interrupting devices. (4/2/28, U.S.)
3 771 British Thomson-Houston Co., Ltd. Electric switching stations. (4/2/28, U.S.)
3 712 Callender's Cable and Construction Co., Ltd., and J. Urmston. Protection of electric circuits, etc.
3 729 V. G. V. Colle. Wireless apparatus.
3 668 R. D. H. Davy. Electrical sound reproducing means.
3 706 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Transformers.
3 707 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Directing sounds.
3 601 W. Donnelly and English Electric Co., Ltd. Battery charging systems.
3 731 J. Feldman. Electromagnetic apparatus. (20/12/28, Germany.)
3 732 J. Feldman. Transformers. (20/12/28, Germany.)
3 621 S. B. Freeman. Insulators for wireless apparatus.
3 665 A. Goodchild. Automatic mouthpieces for telephones, etc.
3 620 J. H. O. Harries. Generation, etc., of electric currents, etc.
3 703 International General Electric Co., Inc. Plant for generating electric current. (3/2/28, Germany.)
3 757 I. Jascourt and M. Steingold. Galvanic batteries.
3 613 W. J. Line. Electric plugs.
3 769 N. W. McLachlan and W. S. Smith. Thermionic amplifiers, etc. (22/12/27.)
3 760 G. C. D. Pfau. Apparatus for generation, etc., of electric oscillations. (2/2/28, Germany.)
3 678 Radiovisor Parent, Ltd. Forming light sensitive bridges, etc.
3 749 F. G. Robinson. Hand carrier for accumulators, etc.
3 751 S. M. Rutnagur. Electric traction for railways.
3 650 C. Scott-Snell. Means for utilising radiant heat.
3 746 Soc. Nouvelle de Constructions Téléphoniques Brevets Tchoubritch Derval. Automatic selecting circuits for telephony, etc. (21/3/28, France.)
3 691 C. S. Weyandt. Thermionic valves. (5/7/28, U.S.)
3 693 C. S. Weyandt. Electric motors. (18/7/28, U.S.)

February 5th

3 941 L. S. B. Alder, W. F. Rawlinson and J. S. C. Salmond. Amplifiers for wireless telegraphy, etc.
3 939 Anglo-American Chemical Co., Ltd., and R. M. Burlison. High tension batteries.
3 808 G. Armstrong. Electric batteries.
3 778 W. A. Carr. Apparatus for recording position of wireless stations.
3 820 Chloride Electrical Storage Co., Ltd., and H. Dean. Accumulators.
3 913 Eastern Telegraph Co., Ltd., H. V. Higgitt, W. C. Hubble and K. L. Wood. Telegraph transmitting apparatus, etc.
3 804 Electrical Apparatus Co., Ltd. Measuring instruments, etc.
3 852 Electrical Research Products, Inc. Television systems. (24/2/28, U.S.)
3 842, 3 843 W. E. Goodwin, and Siemens Bros. and Co., Ltd. Telephone instruments.
3 877, 3 878, 3 879 B. Hesketh. Wireless receiving apparatus.
3 880 B. Hesketh. Inductances.
3 881 B. Hesketh. Sound reproducing devices.
3 783 F. W. Miller, and Thermostatics, Ltd. Control for electric cigar, etc., lighters.
3 871 R. Newton. Electric switches.
3 921 M. B. Richter. Electric relays.
3 812 P. Saunders. Clockwork for actuating [illegible] switch.
3 922 Siemens-Electro-Osmose Ges. Electro[illegible] separation of latex, etc. (8/2/28, Germany.)
3 923 Siemens-Electro-Osmose Ges. Electro[illegible] separation of latex, etc. (17/3/28, Germany.)

The New Lamp Prices.

THE lamp price ons, foreshadowed in these columns last week, have now been announced by the E.L.M.A., and have, we believe, been received with general satisfaction in the trade. As will be seen from the detailed particulars given elsewhere in this issue, the present reductions —which form, by the way, the sixth decrease since the war—are based on the definite policy of encouraging the use of "pearl" and "opal" lamps and decreasing the number of types of lamp which the trade is expected to stock. Further, by offering additional price advantages for standard voltage lamps, E.L.M.A. has taken a definite commercial step to encourage supply authorities to adopt 230 V in place of the variety of pressures now adopted between 200 and 260 V, a move which will still further reduce the variety of lamps stocked. A particularly welcome feature of the announcement of these new prices is the leaflet which has been prepared to explain the reasons for the changes, not only to the reseller, but to the domestic consumer. "Glareless Light Preserves the Sight" is a slogan capable of profitable exploitation.

Steam at 1200 lb.

STATION engineers will follow with some interest the steam practice which is being adopted in the erection of the new Holland station of the General Gas and Electric Corporation, on the Delaware River, New Jersey. Local conditions led to comparisons being made between steam pressures of 400 lb., with no reheat, two- and three-stage extraction, with 550 lb. reheat and 1 200 lb. reheat, both with four-stage extraction. Consideration of the fixed charges, plus the production cost, showed that the 550 lb. reheat plant was less economical than the 400 lb. no reheat plant, because the saving in B.Th.U. consumption of the former was more than offset by the increase in fixed charges. The 550 lb. plant was also more expensive in both first cost and B.Th.U. consumption than the 1 200 lb. plant, so that the choice was narrowed down to the 400 lb. and 1 200 lb. pressures, and finally it was decided that the 1 200 lb. reheat cycle was the most economical. It is noteworthy that all previous 1 200 lb. installations have been arranged as an increment to an existing, fairly efficient station, thus allowing the high-pressure units to be operated under base load conditions. In the case of the Holland station, however, largely fluctuating load conditions were expected, and variable load operation was considered throughout the design of the station. A flat steam consumption curve on the high-pressure turbine being desirable, it was suggested to turbine manufacturers that this be obtained by several steam admission valves on the high-pressure machine instead of a single valve such as is used on the 1 200 lb. plants already in operation and turbines having four and five valves were designed. It is expected that the station will be put in commission next October.

Carrier Current on Power Systems.

ALTHOUGH carrier-current telephony is chiefly of academic interest to central station engineers in this country, the great distances covered by the systems of some of the American power companies have directed attention to the practical possibilities of this form of communication. After trying telephony mainly on separate pole lines adjacent to the power lines, and replacing this by radio, the Alabama Power Co., in 1925, seriously investigated the possibilities of carrier-current equipment, and after overcoming many initial difficulties, a satisfactory system was evolved. The conclusions to be drawn from the experience so obtained are that carrier-current communication is thoroughly practical for power lines, but operates better on radial lines than on networks. For long distances it has been found to be more reliable and economical than telephone lines, but it is desirable that short taps on lines used as carrier-current channels should be avoided or isolated. For satisfactory operation, a careful preliminary study of the power circuit characteristics, and careful, frequent and competent inspection, are regarded as essential.

The Mid-East England Scheme.

THE electricity scheme for Mid-East England, details of which were given in THE ELECTRICIAN in January last, has, in the main, been adopted in its original form by the Central Electricity Board. The chief alteration to the scheme as originally submitted by the Commissioners is that both the Chesterfield and Keighley stations have been transferred from the list of "selected" stations to "temporary arrangements," thus reducing the original eighteen "selected" stations to sixteen. The area of the scheme, embracing some 7 500 odd square miles, is one of the most important so far catered for under the Central Electricity Scheme, such industries as coal, iron and steel, engineering and textile, as well as large agricultural tracts of land all falling within its boundaries. No additional power stations are required to be built before the scheme can be put into

Digitized by Google

operation, and no frequency difficulties will be met with, in that there is practically no non-standard frequency plant within the area. In any case where such exists it is to be allowed to remain in operation, as alteration of such systems is not regarded as essential. On account of the standard plant and capacity of the stations chosen as "selected" units, the capital expenditure required to bring the scheme into force is lower than that estimated for other adopted schemes, the total expenditure being as low as £4 616 750, representing £2 907 156 to be spent on transmission lines and transformer stations by the Central Electricity Board, and £1 709 594 by owners of selected stations on plant extensions, etc.

A "Light" Jest.

A CARTOONIST in the "Daily Mail" on Tuesday amusingly illustrated "the story of the light that wouldn't go out: an experiment in remote control." It depicted the adventures of a man who, before retiring to read in bed by the light of an electric lamp fixed over his bed, was at some pains to rig up a length of string from the dolly of the switch at the other end of the room to his bedside. Repeated tugs at the string, when the necessary degree of somnolence had been induced, only resulted in the breakage of the elementary remote control apparatus, and in the last resort the light was put out by a shoe well and truly aimed at the offending lamp. In this jest is a moral for electrical contractors, for the number of householders who try to make good a shortage of convenient switching points by "Heath Robinsonian" contraptions of string and staples is legion. The alternative only needs to be put to them in a suitable way.

Avoiding Opposition.

SUPPLY authorities who encounter local opposition when seeking to extend their areas of supply in rural districts might do worse than study the methods of the Western Electricity Supply Co., Ltd. In connection with the company's proposal to give a supply to Charlbury a public meeting was held, at which Mr. A. J. BRIDGE, the company's publicity and development manager, gave an interesting address in which he explained the national electricity scheme, the developments which are taking place in the Wessex area, the uses of electricity in the home, farm, and workshop, and the cost of wiring and energy. Judging by the questions asked at the close of the address it was obvious that the public can take an intelligent interest in these matters if only it is allowed to, and the meeting closed with assurances of unanimous support for the Charlbury project. If there were more of these frank and informative preliminary explanations there would be far fewer wayleave disputes and other obstructionist tactics.

Occasional Heating.

IN the dark and wholly cold days of the winter housewives who have not yet been converted to electrical homekeeping light their dust-producing fires as a matter of course. April is a month in which much deliberate dirt-production is avoided as far as possible, but when the sun has gone down considerations of temporary comfort outweigh those of house cleanliness, and warmth is secured by much the same methods as are employed by primitive uncivilised tribes. This, then, is the time for the electrical industry to get really busy advocating electricity as the ideal system for providing local heating during the brief but recurring chilly periods of an English Spring. The E.D.A. has definitely designed its publicity programme for April to assist selling on these lines, and has a very effective series of advertisements booked to appear in national newspapers, with the usual range of stereos for local Press advertising, by supply authorities and contractors. Two alternative window displays are available, employing part of the "cube" outfit used in previous months, and an appropriate new double-crown poster has also been prepared for use during April. With such backing the extension of business in occasional heating, including water heating, promises to be a comparatively easy proposition, and may in many cases prove to be the thin end of the wedge of a permanent electric heating installation for winter use.

"Killing Two Birds . . ."

THE temptation to present two papers on similar or related subjects for discussion at one time is difficult to resist, but the recent I.E.E. discussion in London on the papers on "Direct Generation of Alternating Current at High Voltages," and "Recent Developments in Turbo-Generators" stands as an illustration of the fact that such attempts to "kill two birds with one stone" usually fail to kill either. Each of the papers, alone, would probably have given rise to a full and lively discussion. In this case, as in many others, in the Institution and outside it, practically all the discussion was centred on one of the papers, and owing to the time occupied in presenting the two, no time was left for more than very brief replies to be made by the authors. If a full-length paper is sufficiently important to have separate form it should also have a separate discussion.

Atmospheric Pollution.

IT is difficult to regard in a temperate way the ridiculous agitation which has been engineered in London over the possibility of atmospheric pollution from the London Power Co.'s new Battersea station, for while amazing estimates have been put forward of the harmful effects of the products of combustion of the fuel to be used at this station, where the most modern methods and appliances for its combustion will naturally be employed, not a word is said about the stupendous quantities of soot which are daily deposited over the whole of London—and for that matter every city and town in the country—by domestic coal fires. Measured in terms of illness, death, and architectural deterioration, the toll taken by the coal fire is enormous, yet nobody seems very worried about it. A capital station in which every possible means will be taken to prevent evolution of oxides of sulphur will not add to the trouble. It will reduce it very considerably, and the extent of that improvement will only depend on the assiduity with which sales staffs cultivate the domestic electric heating load.

Utilising Waste Products.

ALTHOUGH our power stations are relatively guiltless in this matter of atmospheric pollution it is to be hoped that supply authorities will not be content to go on adding their quota, however small, to the desolation of our fair country, without taking energetic steps to reduce their contribution to an immeasurable quantity. It has long been the proud boast of all connected with the electrical industry that cleanliness is one of the outstanding virtues of electricity, but counter-propagandists are now indirectly attacking this strong point by the suggestion that the making of electricity is a dirt-producing process. It is, of course, a mischievous argument but one cannot deny its psychological value when skilfully used by those who do not pray for the successful development of electricity. The best way to counter this snowball half-truth is to deprive the allegations of the modicum of truth which they now possess, by evolving methods which will ensure that no noxious products are emitted. This is not easy, and would probably be expensive but for the possibility of making some effective use of the waste products which we shall in time withdraw from our chimney-stacks. As yet there is a paucity of suggested solutions of the problem, though we see that Mr. ALAN E. MUNBY has been advocating in "The Times" the injection into the chimney gases, at some appropriate stage of their progress, finely divided lime which, possibly with the aid of a steam jet, would result in fixing these gases by the formation of calcium sulphite and sulphate. The problem is an interesting one, in the solution of which the services of the chemical engineer might very usefully be enlisted.

ELECTRICAL CIRCUIT THEORY BASED ON THE METHOD OF COMPLEX NUMBERS.

Historical Development—Some Possibilities of the Method in Simplifying the Mathematics of the Alternating Current Circuit—Advantages over Other Methods.

By G. WINDRED.

THE object of the present paper is to set forth, in its historical order of development, the theory of that part of pure mathematics dealing with the conception of two dimensional numbers, which theory has proved of great assistance to the pure mathematician in connection with the theory of equations, and a source of considerable difficulty and misunderstanding in its application to certain of the sciences. An attempt is also made to demonstrate the possibilities of the method as a means of simplifying the mathematics of the alternating current circuit.

An interesting fact, which will probably appeal to students of both mathematics and electricity, is that the existence of complex numbers has been known for nearly four hundred years, and it was only toward the close of last century that the conception came to be applied to electrical theory. During the intervening period only a comparatively few contributions to the subject have been made, mostly from the purely mathematical viewpoint. The contributions to the applications of the theory to analytical problems culminate in the researches of Schwarz * and Christoffel†. The observations of these investigators are confined, however, to the theory of conjugate functions, and have no immediate bearing on the present subject matter.

In the circumstances it is pardonable and in many ways desirable, to give a brief history of the subject, as there is no doubt that the clearest conceptions of such principles follow from an appreciation of the conditions giving rise to them. An historical study makes it evident that for a long time after their inception both imaginary and complex quantities were regarded as being entirely devoid of significance, and were, in consequence, very much neglected. In this connection it is interesting to note that even so late as the end of the eighteenth century certain scruples existed concerning the admission of negative roots.‡

Historical.

The conception of complex or imaginary numbers belongs essentially to the theory of equations, and although it is impossible to state the exact period of its introduction, the subject seems to have been first definitely established in the famous "Ars Magna," published by Cardan in 1545. This work represents a great improvement upon previous mathematical publications, although it is very much open to doubt whether certain parts of it were original. Since Cardan's concern was chiefly the theory of quadratic and cubic equations, and apart from establishing a proof that the complex solutions of these equations occur always in pairs, he did not develop the theory of these "sophistic" quantities, as he called them.

The next contributor to the science, who, incidentally, was the first writer to give a geometrical interpretation to the complex roots of a quadratic equation, was John Wallis, whose "Algebra," published at Oxford in 1685, contains some very careful demonstrations of the spatial meaning conveyed by the square root of a negative quantity. Although some of these demonstrations are not above criticism, the volume represents an important advance in the theory in this direction. It may also be noted that Wallis regarded the idea of negative quantities as absurd, and declined to accept any such idea.

Many years elapsed before the subject was again approached, this time by Heinrich Kühn, who in 1753 published his somewhat unsatisfactory paper, "*Meditationes de quantitatibus imaginariis construendis, et radicibus imaginariis exhibendis*," which, while displaying several interesting propositions, does not represent an appreciable advance in the fundamentals of the subject.

To Euler is due the highly important theorem, which we shall have occasion to use hereafter, which connects the trigonometrical and exponential functions in the form $\cos\theta+i\sin\theta=e^{i\theta}$, and to Gauss lays the credit of the discovery that every algebraical equation has a root of the form $a+bi$. This demonstration was published in 1799.

Wessel's Contribution.

We now come to what is probably the most important contribution to the subject from the present viewpoint. In the year 1797, Caspar Wessel presented to the Royal Danish Academy his interesting memoir "Om Directionens analytiske Betegning," which contains, among other things, a demonstration of the fact that $\sqrt{-1}$ may be regarded as representing perpendicularity in two-dimensional space, and an extension of this conception to vectors in three dimensions by a method foreshadowing that of Hamilton's quaternions, to which we shall later make specific reference. In view of the subsequent importance of this memoir it is strange to note that it had no evident influence on contemporary mathematics, and was neglected for exactly a century, being republished in French by Thiele and Valentiner at Copenhagen in 1897. The object of Wessel's memoir was primarily to develop a system of vector algebra, and in the pursuance of this object he gave many important demonstrations concerning the theory of complex numbers.

Among the abnormal number of memoirs published by Cauchy are to be found those dealing with the question of the circumstances governing the application of complex numbers; the determination of the number of real and imaginary roots of an equation; and the method of establishing a connection between different branches of a subject by assigning complex values to independent variables.

In the year 1806 was published the famous memoir by Argand, entitled "Essai sur une manière de représenter les quantités imaginaires dans les constructions géométriques." This memoir commences with a consideration of the complex number in its directive relation to positive and negative quantities, and shows its correspondence with vertical direction when considered in this manner. The rules of addition and multiplication of such directed or complex quantities are then considered; the subsequent procedure then being on the lines established by Wessel. The memoir also contains a number of trigonometrical identities which are somewhat indifferently developed.

The next important contributions to the subject are two publications in the year 1828. In this year the Rev. John Warren published at Cambridge "A Treatise on the Geometrical Representation of the Square Roots of Negative Quantities." This work comprises a thorough and carefully written examination of important parts of the theory, to the literature of which it forms an important addition.

Also in 1828 was published in Paris a work by C. V. Mourey, entitled "La vraie théorie des quantités négatives et des quantités prétendues imaginaires." In this work the theory of vectors is systematically studied, and certain theorems on vector operations are developed. The forms of notation employed by this writer have not survived, but several of the problems he discusses are of distinct mathematical value.

On April 15th, 1831, was presented to the Royal Society of Gottingen a notable memoir by Gauss, entitled "*Theoria residuorum biquadraticorum, commentatio secunda.*" In this paper the question of the significance of $\sqrt{-1}$ as an operator is discussed in its relation to co-ordinate systems by an ingenious demonstration based on the theory of transference between related series.

At this period of its somewhat chequered history the conception of a complex quantity begins to influence various branches of mathematics, and on this account it becomes difficult to trace further developments in the fundamentals of the theory. The second half of the nineteenth century saw many contributions to the theory, and it would be quite impossible even cursorily to mention them. They affect, in general, not the fundamentals, but the higher branches and developments of the subject. We find it difficult to take

* Crelle, 1869, tome 70.

† Annali di Matematica (2), 1867, tome 1.

‡ Maseres and Frend may be regarded as the last writers who objected to the use of negative roots. Maseres' objections are frequently found in his extensive writings, and those of Frend are contained in his "Principles of Algebra, 1796," and "True Theory of Equations," 1799.

Digitized by Google

leave of this part of the subject without some slight reference to these developments, which have attained a very high standard of mathematical rigour, chiefly at the hands of the German school.

We may for the present purpose regard these developments as taking place in two different branches: the theory of geometry of the complex plane, and the algebraical theory of number pairs. To the latter we shall hereafter have occasion to refer. The former, though lying outside the scope of the present paper, warrants, in virtue of its analytical importance, at least a passing reference.

Geometry of Complex Plane.

The theory of geometry of the complex plane concerns itself with that geometry in which the co-ordinates of a point are complex quantities of the form $x+ix^1$, $y+iy^1$, $z+iz^1$. The use of complex quantities in this capacity affects such a geometry with three important conditions which occur when (1) x, y, z are zero, (2) x^1, y^1, z^1 are zero, (3) when only those points whose co-ordinates are real multiples of the same complex quantity, $a+ib$, are considered. Such conceptions render possible the deduction of the geometry of real points, having applications in both co-ordinate and projective geometry.

From this preliminary deviation, we now turn to a consideration of the applications of these methods to electrical theory, considering in the first instance the geometrical aspect of the problem, and in the second instance the application of algebraical methods. To prevent undue prolixity, it will be necessary to pre-suppose an acquaintance on the part of the reader with the usual *modus operandi* given in such mathematical books as contain reference to the theory of complex numbers.

If the vector representing alternating values such as are encountered in electrical theory is considered in the usual notation, it becomes subject to all the laws of vector analysis.

In this way, alternating current theory becomes amenable to the usual vectorial operations, and hence also to analysis by means of the theory of complex numbers.

In consequence, the advantages resulting from vectorial methods are extended to their logical conclusion, and when accurate computations, necessitating the use of algebraical methods, are required, the algebraical theory of complex numbers is available for the quantitative continuance of the preliminary spatial conceptions.

Thus the employment of the theory of complex numbers has the distinct advantage over ordinary methods in that it maintains a conceptual uniformity of operations. In the algebraical part of the theory, the operations are still related to the spatial properties of vectorial representation, and the transition from vectorial to algebraical theory becomes a natural one.

From the elementary theory of complex numbers we know that the vector quantity **A** may be expressed in any of the forms

$$\mathbf{A}=a+jb,$$
$$\mathbf{A}=A(\cos\theta+j\sin\theta),$$
$$\mathbf{A}=A\varepsilon^{j\theta},$$

or, if the "imaginary" lies in a negative quadrant of the cartesian co-ordinate system,

$$\mathbf{A}=a-jb,$$
$$\mathbf{A}=A(\cos\theta-j\sin\theta),$$
$$\mathbf{A}=A\varepsilon^{-j\theta}.$$

In what follows, we shall use the Clarendon type to indicate vectorial quantities and the ordinary type to indicate scalars. Thus **A** is a vector, and A a scalar. We assume that the vectorial theory of alternating currents is so well known as to require no elaboration here.

If an alternating voltage of instantaneous value e is applied to a circuit consisting of resistance R, and self-inductance L, the e.m.f. due to induction is represented by the expressio $-L\frac{di}{dt}$, in which i is the instantaneous value of the current, and the $-$ sign indicates that the e.m.f. of self-induction opposes the applied e.m.f. It follows therefore, that

$$i=\frac{e-L\frac{di}{dt}}{R}$$

$$e=Ri+L\frac{di}{dt} \quad . \quad . \quad . \quad . \quad . \quad (1)$$

Many mathematical operations may be simplified by using the operator D to represent $\frac{d}{dt}$, and by adopting this procedure, equation (1) becomes

$$e=(R+LD)i \quad . \quad . \quad . \quad . \quad . \quad . \quad (2),$$

and since the alternating value i may also be written as $I\sin\omega t$, where ω has the usual significance, it follows that

$$e=RI\sin\omega t+LDI\sin\omega t,$$

and since

$$DI\sin\omega t=-\omega I\cos\omega t,$$
$$e=RI\sin\omega t-\omega I\cos\omega t.$$

If we take the second differential, representing it by D^2, we obtain

$$D^2I\sin\omega t=-\omega^2I\sin\omega t,$$

from which

$$D^2=-\omega^2, \text{ or } (\sqrt{-1}.\omega)^2$$

and therefore

$$D=\sqrt{-1}.\omega=j\omega.$$

By substituting this value of D in equation (2) we obtain the relation

$$e=(R+j\omega L)i \quad . \quad . \quad . \quad . \quad . \quad . \quad (3),$$

from which it is apparent that

$$R+j\omega L=\frac{e}{i} \quad . \quad . \quad . \quad . \quad . \quad . \quad (4),$$

and consequently represents the total impedance of the circuit.

Thus, by means of the operator j, the impedance of the alternating current circuit may be expressed in the form of a complex number, consisting of a real quantity R in the axis of reals, and another quantity ωL in the quadrature, or imaginary axis.

It may be inferred from the foregoing considerations that both e and i may be regarded as complex quantities of the respective forms

$$e=e_r+je_x,$$
$$i=i_r+ji_x,$$

where e_r, i_r are the resistive components, and e_x, i_x the reactive components of the instantaneous values of voltage and current respectively.

Simpler Manipulation.

The manipulation of such complex terms, which we have shown to be subject to algebraical laws, is in general much more practicable than the corresponding operations with the usual algebraical forms. It has been shown elsewhere that the result of any mathematical operation with complex quantities is expressible in the form of a complex quantity. If real values of the result are required, this forms no objection, since the result may be arranged in the most appropriate form, depending upon whether the modulus, argument, or component values are required.

If the quantities e and i are both regarded as harmonic functions of the time, equation (3) may be written in the form

$$E\cos(\omega t+\alpha)=(R+j\omega L)I\cos(\omega t+\beta).$$

Differentiating both sides with respect to t gives

$$\frac{d}{dt}E\cos(\omega t+\alpha)=-\omega E\sin(\omega t+\alpha)$$

$$\frac{d}{dt}I\cos(\omega t+\beta)=-\omega I\sin(\omega t+\beta),$$

and therefore

$$-\omega E\sin(\omega t+\alpha)=(R+j\omega L)[-\omega I\sin(\omega t+\beta)].$$

Now multiplying both sides by $-\frac{j}{\omega}$ reduces the expression to

$$jE\sin(\omega t+\alpha)=(R+j\omega L)jI\sin(\omega t+\beta),$$

and if i be put into the complex form $I\cos\omega t+jI\sin\omega t$, we have

$$e=(R+j\omega L)(I\cos\omega t+jI\sin\omega t),$$

which, in exponential notation may be written

$$e=\sqrt{R^2+(\omega L)^2}.I\varepsilon^{j\alpha}.I\varepsilon^{j\omega t}$$
$$=\sqrt{R^2+(\omega L)^2}.I\varepsilon^{j(\omega t+\alpha)}$$

so that

$$ZI\varepsilon^{j(\omega t+\alpha)}=ZI[\cos(\omega t+\alpha)+j\sin(\omega t+\alpha)] \quad . \quad (5)$$

Again, taking the differential equation

$$Ri=-\frac{d}{dt}\left[Li+I(\cos\omega t+j\sin\omega t)\right] \quad . \quad . \quad . \quad (6)$$

and re-arranging in the exponential form, we have

$$Ri=-\frac{d}{dt}\left(Li+I\varepsilon^{j\omega t}\right) \quad . \quad . \quad . \quad . \quad . \quad . \quad (7),$$

the solution of which will clearly be proportional to $\varepsilon^{j\omega t}$. The operator $\frac{d}{dt}$ acts only on this term, and therefore corres-

Digitized by Google

ponds to multiplication by $j\omega$. Therefore the equation (7) may be written

$$Ri = -j\omega (Li + I\varepsilon^{j\omega t}),$$

which gives as a solution

$$i = \frac{-j\omega I \varepsilon^{j\omega t}}{R + Lj\omega} \quad \ldots\ldots\ldots \quad (8)$$

Containing imaginary terms in both its parts, this equation may consequently be expressed in the form of a single complex quantity

$$\rho,\ \theta = \rho\ (\cos\theta + j \sin\theta).$$

Since the value of the modulus, ρ, of this expression, is evidently equal to the product of the moduli of the terms $-j\omega I \varepsilon^{j\omega t}$, and $R + Lj\omega$ in equation (8), and these moduli are the quantities ωI and $\sqrt{R^2 + (\omega L)^2}$ respectively, we have

$$\rho = \frac{\omega I}{Z}$$

The argument, θ, being equal to the sum of the arguments of the component terms, which have the respective values $-j$, $+\omega t$, and $\frac{\omega L}{R}$, is given by the expression

$$\theta = \omega t - j - \tan^{-1}\left(\frac{\omega L}{R}\right),$$

so that the real solution for i is

$$i = \rho \cos\theta$$
$$= \frac{\omega I}{Z} \sin\left[\omega t - \tan^{-1}\left(\frac{\omega L}{R}\right)\right]$$

(To be continued.)

BOOK REVIEWS.

Englische Elektrizitätswirkschaft. By Dr. Rer. Pol. Gunther Brandt. (Berlin: Julius Springer.) Pp. v + 112. 6 marks.

This is a remarkably thorough account of the organisation and legal and economic aspects of the electric supply industry in Great Britain. The whole history is surveyed from the beginning up to the 1926 Act, and the publication of the first four of the Commissioners' schemes.

The material is almost entirely drawn from official publications such as the various Electricity Supply Acts, the publications of the Electricity Commissioners, various official reports and a number of other publications. The author has succeeded in the difficult task of presenting this mass of material in a form which enables the reader to survey the whole situation and its development with comparative ease. The information given is accurate, and not overburdened with statistics, and the author has visualised his subject with a better perspective than could perhaps have been obtained by someone in this country more intimately concerned with the details. All this is done in 110 pages.

The story unfolded makes very clear what is, of course, common knowledge that from 1882 onwards restrictive legislation has most seriously hampered the healthy development of the electricity supply industry. Anxiety on the part of the legislator to safeguard the interests of the consumer first and foremost was, no doubt, the basis of the restrictive measures adopted. This anxiety, if not exaggerated, was at least badly misdirected, and, at best, governed by administrative considerations while entirely ignoring engineering ones. One realises very fully when surveying the whole field as presented in this book to what extent legislation made it impossible in the past for the electricity supply industry to place itself on a sound engineering basis.

The most conspicuous thing about electricity is the ease with which it can be transmitted and distributed over distances. The early Acts deliberately restricted the area of distribution. Another notable feature of electricity is that compared with most marketable commodities it is very easy to cost, and therefore easy to sell on the basis of a two-part tariff. Legislation discouraged any tariff but the flat rate.

During this century the two principal attempts before 1926 to improve the situation and to introduce some measure of order and engineering efficiency into the confusion that was fast becoming worse confounded were too half-hearted to have the necessary measure of success. The Acts of 1899 and 1909 attempted to make use of the suitability of electricity for long distance transmission and to abolish some of the previous restrictions; but legislation attempted, most unfortunately, to have it both ways, to achieve a unified supply over large areas and to prevent monopoly existing in these. The two things are incompatible, and the engineering and economic possibilities could not be properly developed because of the restrictions which took from the power companies with one hand what was given with the other. It is no doubt necessary to safeguard the consumer against monopolies, but it soon became evident that a compromise which results in wasteful and unsound engineering and a bad exploitation of transmission mains as well as uneconomic generation is ultimately to the disadvantage of the consumer. The 1919 Act renewed the attempts of 1899 and 1909, but it was even more of an attempt to reconcile incompatible aims, to compromise between divergent interests and prejudices and, apart from inaugurating the Electricity Commission, the value of which must not be underrated, it remains largely a dead letter.

All this history contains much of which we have no great cause to be proud, though the author does not rub this in. It may, however, be doubted whether the condition of electricity supply is much more rational in other parts of the world. Inevitably in every country people must be saying that they would manage these matters very differently if they could begin now with a clean sheet. So we may expect that a very similar skeleton to our own is locked away in the cupboards of electricity supply industries elsewhere. Too many stations, too many systems, too many frequencies, too much independence, and, occasionally, too little willingness to co-operate, lack of co-ordination, wasteful generation, unnecessary spare plant, competitive and unnecessary duplication of transmission mains are certainly not peculiar to Great Britain. But the very exhaustive statistics we possess, thanks to the Electricity Commissioners, may throw the door of our skeleton cupboard a little wider open than it is elsewhere.

The story of British electricity development is told in detail and without comment in the book under review, and until the last few pages are reached the reviewer can find little to disagree with in what the author has to say. One would expect that the final conclusion reached, as the result of a review of past history, would be that restrictive and half-hearted legislation is shown to have failed, that compromises are a mistake, that other and better means must be found for safeguarding the consumer than to limit the expansion of sound engineering undertakings, that individualism can go too far, that in view of the failure or partial failure of the 1919 Act it is proved beyond the capacity of human nature for a large number of people with conflicting views and interests to organise themselves without the help of an outside organiser vested with sufficient authority.

In short, the logical conclusion that seems to be reached from consideration of the developments outlined in this book would be that a radical break with our past bad ways, such as is constituted by the 1926 Act, is the only means of straightening out the present tangle. The author, however, draws the opposite conclusion, namely, that though a co-ordination of the whole electricity supply in the country is necessary, this should be left to grow out of the initiative of individual undertakings.

This reminds us of discussions that were very keen here up to the passing of the 1926 Act, but tended naturally to be treated as of smaller practical interest from the moment when we had burnt our boats.

Reginald O. Kapp.

Electric Drive Practice. By Gordon Fox. (London: McGraw Hill Publishing Co.) Pp. 420. 17s. 6d. net.

Pre-supposing a suitable knowledge of electric motors and control, the book, after dealing generally with the advantages of electric motor drive, enumerates factors governing the selection and application of motors and the selection of starting and control equipment. Chapters are devoted to the mechanical and electrical features of motor installation, and then detailed applications of motor drive are examined in a series of chapters, concerned successively with centrifugal fan and blowers and propeller fans; centrifugal compressors, positive-pressure rotary blowers, air and ammonia compressors, pumps, travelling cranes, elevating and conveying machinery, hoists, mine hoists, and machine tools. The elements of load are evaluated, and the factors affecting the load and the motor size determination for each kind of driven machine are presented, a proceeding which is obviously preferable to the mere listing of machines and motor sizes. Apart from the author's preference for a frequency of 60 cycles and similar Americana, the book should be of interest and value to readers on both sides of the Atlantic.

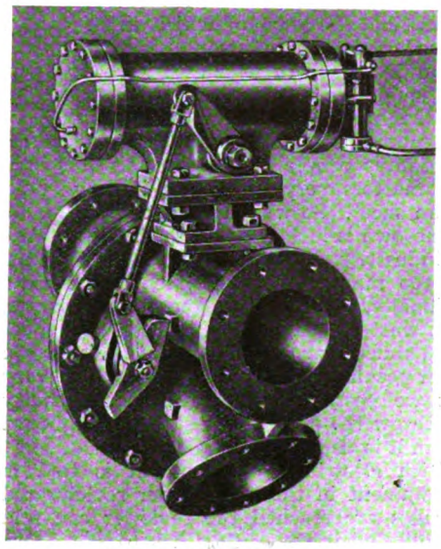
FEED CONTROL FOR PULVERISED FUEL.

Details of an Ingenious System at Brimsdown and Barton—Various Methods of Operation—Automatic Filling of Bins.

AN ingenious system for controlling the supply of pulverised fuel to the various feed bins of a battery of boilers was noticed by a representative of THE ELECTRICIAN when visiting the new Brimsdown power station of the North Metropolitan Electric Power Supply Co. Through the courtesy of Mr. R. C. Graseby and Venner Time Switches, Ltd., who are making the apparatus, we are able to describe and illustrate its salient features.

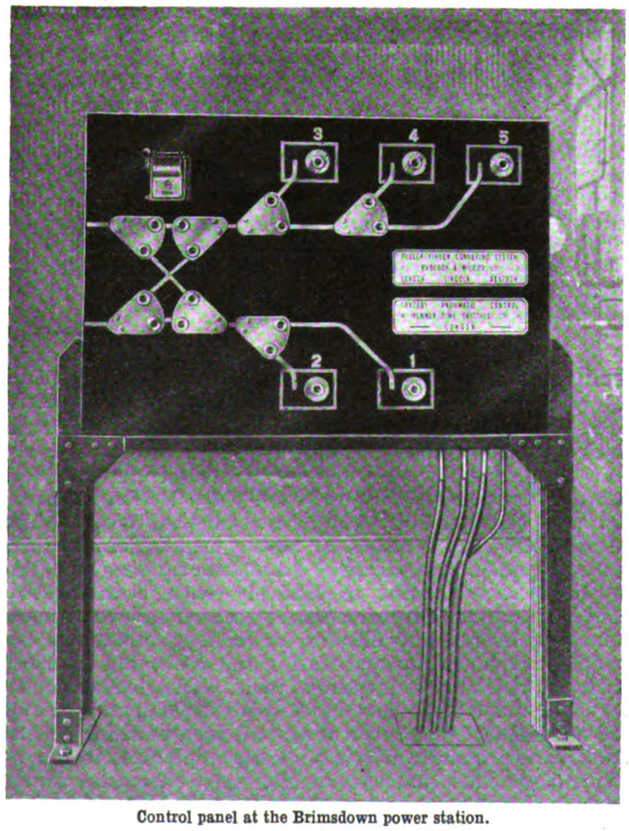


Air motor and 2-way fuel valve.

In this Venner-Graseby system of pneumatic control, two-way valves placed on the fuel feed lines are controlled pneumatically from a remote operating panel, and are actuated by compressed air from the general system used for blowing the fuel along the pipe lines. The control can be wholly or semi-automatic at will.

The three essentials of the apparatus are :—The air motors which operate the fuel valves ; the air-valve gears controlled by paddles suspended in each fuel bin and/or from the control board ; the remote control board and indicator from which the deflection of fuel to different bins is effected.

The air motor consists of a cylinder having a solid piston

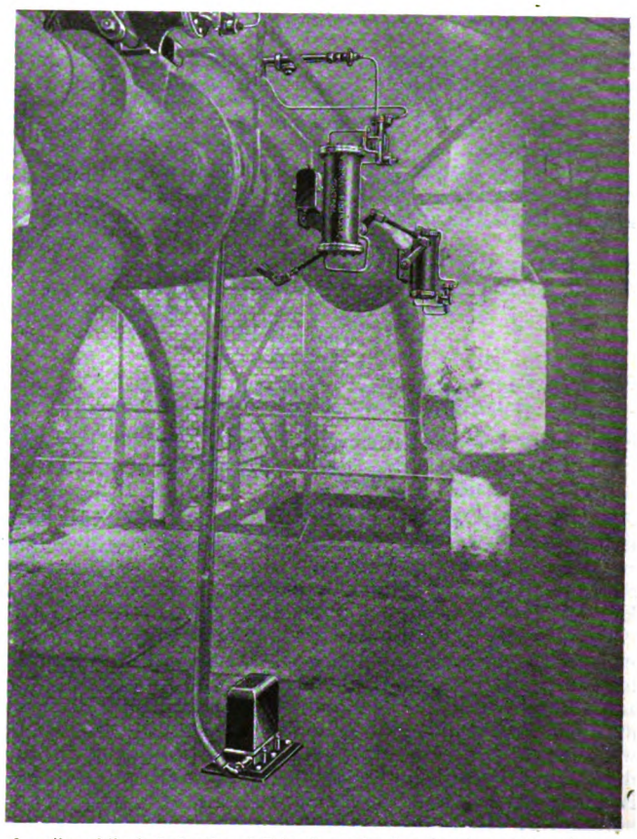


Control panel at the Brimsdown power station.

connected by a crank and connecting rod to the two-way fuel valve controlled by it on the feed line. Compressed air is admitted to one end or the other of the cylinder by the control-valve gear, and the piston pushed from one end of the cylinder to the other, thus moving the two-way fuel valve from one way to the other.

The control valve gear, worked either from the paddle in the fuel bin, or by control from the panel, is operated by the action of compressed air on a diaphragm, and admits compressed air to one end of the cylinder, and at the same time opens the other end to the atmosphere.

The control board has a number of hand-operated air valves



A portion of the fuel pipe line at Brimsdown showing the air motors and cover of paddle valve gear on top of the bin.

corresponding with the number of valves on the feed line. Each fuel bin is also represented by an indicator lamp, and each two-way fuel valve by two other indicator lamps, either of which lights up to show in which position the two-way fuel valve on the feed line is at the moment. White lines are painted on the control panel to represent the fuel feed lines, and by tracing along these lines via the lamps which are lit, it is possible to see which of the main fuel lines is open.

When the pulverised fuel rises in a bin to a predetermined distance from the top it pushes over the vane of the paddle which operates the air valves, admitting compressed air to the valve gear on the air motor actuating the fuel two-way valve feeding that bin. When the fuel falls again, having been drawn off to the boiler, the paddle also falls again and opens (by means of the air valves) the fuel valve, thus permitting more fuel to enter the bin. The electrical contacts on the paddle valve can be arranged to give visual or audible warnings of its operations.

There are several ways of operating the system. In one method (as used at the new Barton power station, Manchester) the valves on the control board are set to admit fuel to the desired bins. The pulverised fuel coming along the pipe line is then directed automatically into the first bin. When this bin is full the vane of its paddle valve is pushed over, thus operating the main two-way valve which shuts off the supply to the bin, and diverts the fuel along the pipe line to the next bin which it is desired to fill. This process is continued all along the line. When the level falls in the first bin owing to fuel being drawn off, its paddle valve goes back to the upright position and again operates the main two-way

Digitized by Google

fuel valve back, diverting the fuel into this bin again. With this system the bins are automatically kept filled.

Another method of using the system (as employed at the new Brimsdown power station) is to set from the control board which bins are to receive fuel as before. When the first bin is full, its paddle valve goes over and deflects the fuel into the next bin, and so on. When the paddle valve falls in this method of operation, it does not operate the two-way fuel valve again, and when all the bins are full, the pulverising and blowing plant will shut down unless the valves are reset from the control board.

132 kV TRANSFORMERS.

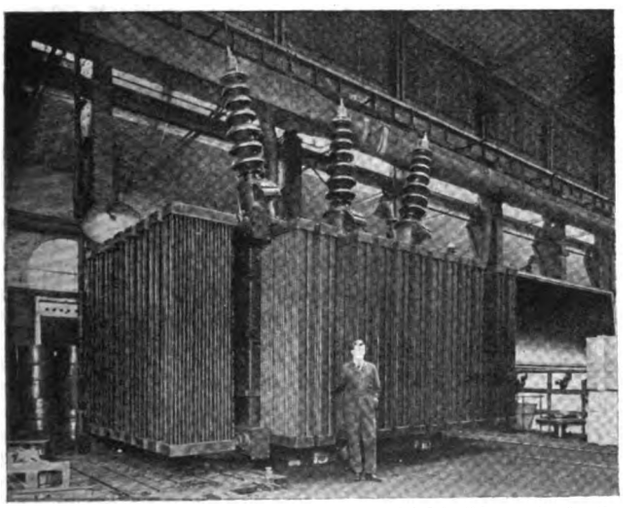
Construction of First Unit for Central Board Schemes.

APART from the primary object of developing the electricity supply industry of this country, the activities of the Central Electricity Board are conferring very great benefits upon British electrical manufacturers by giving them the opportunity to develop electrical apparatus for very high voltages and very great outputs comparable with the products of foreign manufacturers in point of magnitude. These developments will undoubtedly lead to the setting up of a whole series of records for products of British manufacture.

A landmark of this kind is shown in the illustration below, which represents not only the first 132 000 V, three-phase unit to be completed for the national schemes, but is also understood to be the largest unit of the type and voltage which has, so far, been produced in this country. It was constructed by the English Electric Co., which has in hand four 15 000 kVA units like the one illustrated, four 10 000 kVA units of a similar type, and four 5 000 kVA units for 33 000 V.

The high-voltage windings of the 132 kV transformers are star connected with the neutral solidly grounded, and advantage has been taken of this to use graded insulation, with considerable resultant economy. The low-voltage windings are connected in delta, and to provide a neutral a separate earthing reactor will be installed and used also to give a 440 V supply for operating auxiliary apparatus. Each transformer is equipped with on-load tap changing gear to give plus and minus 10% variation in steps of 1·43%. This gear is mounted directly on the side of the transformer tank, and is motor-operated with remote control.

The " English Electric " scheme for effecting tap-changing under load is one in which the auxiliary auto-transformer, with a middle point, enables the equivalent of twice as many tappings to be obtained, as there are actual tappings on the main transformer. The regulating winding is located towards the neutral end of the high-voltage winding, which, of course, is solidly grounded, but between this winding and the neutral is the reinforced portion of the high-voltage winding, which must necessarily be permanently in circuit.



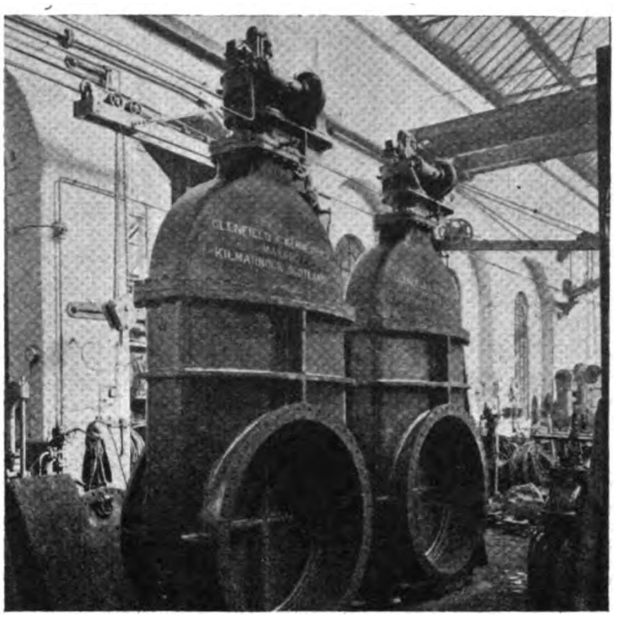
The first 132 kV three-phase transformer completed in this country for the Central Board schemes.

The 15 000 kVA units are arranged to operate with a mixed system of cooling. The transformers are of the five-limb core type, with the windings on the three central limbs.

ELECTRIC SLUICE VALVES.

Two Interesting Electrically-Operated Units for the Ottawa Waterworks.

RAPID progress is now being made in the field of electrically-operated valves, and the tendency in modern waterworks practice is to centralise the control of the main valves throughout the system, so as to save time and labour in operation and prevent dangerous flooding and loss of water in the event of a burst pipe. In this connection we are able to reproduce a photograph of two large self-contained electrically-operated sluice valves, designed for remote control, recently supplied by Messrs. Glenfield and Kennedy, Ltd., of Kilmarnock, to the Ottawa Corporation.



Two large self-contained electrically-operated sluice valves for remote control.

These units are of 60 in. dia., and operate under a head of 34 ft., the valve being operated by a small electric motor driving the screwed spindle through spur and worm reduction gears, the whole being neatly mounted on a headstock, bolted to the valve cover. Current for this motor is controlled by a set of push-button controllers situated in the engineer's office, the valve being automatically stopped at the extreme positions of its travel by either one or other of the limit switches situated on the indicator hood and operated by the pointer. Provision is also made for hand operation in the event of the failure of the electricity supply.

The methods of valve construction follow the firm's usual practice, the body being of the finest grey cast iron, moulded in dry sand, which produces a very smooth finish. Heavy gun-metal faces are fitted to the valve body and door, being securely held in position by screwed brass pins, and hand scraped to form a perfectly watertight joint, while the operating screw is accurately machined from a forging of high tensile manganese bronze, working in a gun-metal nut secured to the valve door.

Great attention has been paid to lubrication; the worm reduction gear, for instance, is housed in a totally enclosed cast iron casing which contains an oil bath. Lubricators are provided for all the headstock bearings, and the ball thrust washers are packed with grease.

The valves are manufactured in all sizes up to 108 in. dia., and for heads exceeding 800 ft., those for the higher pressures being constructed with cylindrical bodies, and equally suitable for controlling water in hydro-electric penstocks, towns' supplies, condensed water circulating systems, and also for exhaust, low and high pressure steam.

One of the latest additions to the equipment is an electrical distance indicator, which shows on a dial, situated in the control house or engineer's office, the exact amount of opening of the valve at any instant. The instrument consists of a transmitter operated by the valve gearing, and a receiver; the installation of this device relieves the operator of all anxiety as to the working of the distant valve, since the motion of the valve door can be followed during the operation of opening and closing.

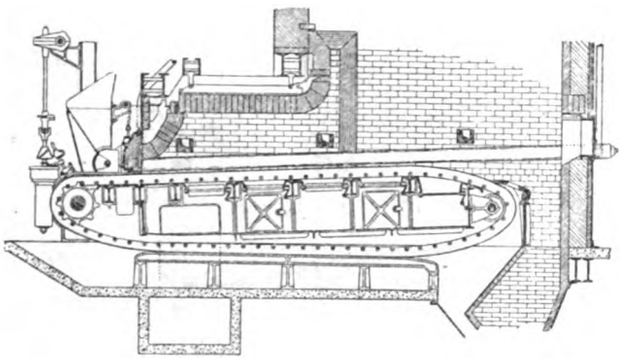
"LOUVRE" STOKERS.

Features of Design to Overcome Station Operating Troubles.

ONE of the main problems of the travelling grate stoker has been to obtain uniform air supply at every point of the stoker width, even up to 30 or 40 ft. wide, from compartments at each side. Again there has been the difficulty that the red-hot riddlings continuously fall down into the wind box between the links, causing all kinds of troubles in the way of

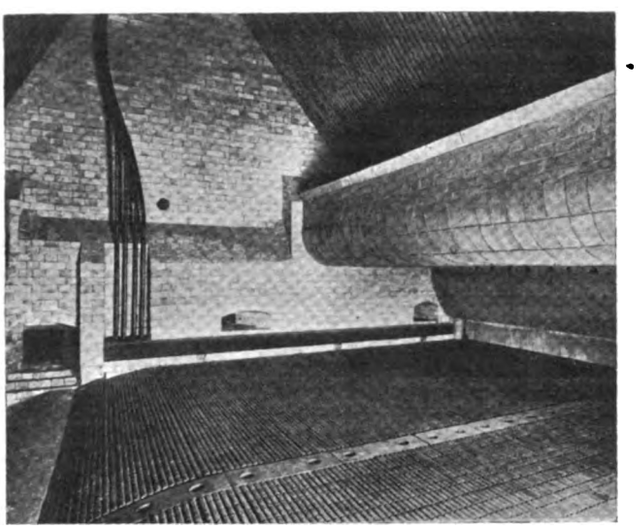


Sectional view of the "Louvre" stoker showing air valves in five transverse series, each separately controlled.

local wear and tear, as well as necessitating complicated mechanically operated riddlings discharge gear.

In the Underfeed "Louvre" type travelling grate stoker, which has been designed to overcome these problems, the bars of the grate are of cast iron as usual, but constructed on a new principle, consisting of a series of free swinging louvres, arranged transversely in sections the full width across the chains, to which they are attached by pivots engaging in small carrier bars. In forming the actual grate surface these transverse parallel links all lie back on one another at an angle of about 45 deg. to the horizontal, with air spaces formed between them, taking the coal as usual, which burns as it travels, the ash and clinker being delivered over the rear as the chain passes round the drum.

These swinging louvres are so designed that they carry the riddlings and dust in between them by means of projecting ridges, and as the chain travels down and round underneath at the rear all the links swing down on their pivots, hanging on the return travel quite free and vertical. The result is



The combustion chamber of one of the boilers at Barking power station.

that the riddlings are discharged, automatically and continuously, into a hopper arranged under the rear of the stoker and immediately adjacent to the ash hopper, and no solid material passes down into the wind box, so that specially mechanically operated riddlings discharge gear (particularly liable to breakdown) is eliminated altogether, the chain itself carrying out this function. It is further claimed that by the use of free swinging loose links, no partial burning out, distortion or other trouble will alter the air space, since the links merely lie up on each other at a different angle. Furthermore, ash and clinker cannot remain between because the links always swing wide open.

With regard to uniform air distribution the forced draught fan discharges, by means of two compartments at each side, direct into one very large and simple wind box, of ample height and capacity extended for the full width and almost the entire length of the chain. But underneath the chain the entire area is divided both longitudinally and transversely into a series of compartments, each serving with air its own section of the grate surface above.

Inside these compartments, close to the grate, are a number of small shutters, arranged in rows and operated together by common shafts projecting from one side of the setting with wheel controls. By operating these wheels the air supply valves are opened or closed accordingly.

For stokers over 15 ft. a characteristic feature is that the chain grate is made of two independent chains side by side within the same setting; since, with this arrangement, the span of the supporting beams is halved, a much lighter and more efficient type of construction can be used free from excessive bending or twisting stresses, while each chain functions as a separate and independent unit so far as front drum shaft driving sprockets and other mechanism is concerned. Further, the coal hopper functions in two parts, each with its own coal regulating shutter, cut-off grate and other equipment, and, if necessary, one chain may be operated when the other is stopped, with the air supply controlled accordingly, just as the method of working each chain may be altered slightly to suit variations in the quality of the coal in the two side bunkers generally employed for modern wide settings.

The stoker is designed to burn all kinds of fuels down to coke breeze and fine anthracite, in amounts up to 50 lb of coal per sq. ft. of grate area, and also operates easily with air heating. At the Barking power station, for example, the air is about 500 deg. F. as delivered to the stoker. In this case the boilers are 85 000 lb. per hour normal evaporation, with 127 500 lb. overload, the stokers being 19 ft. wide, and 332 sq. ft. in effective grate area; a special equipment fitted is a square weldless steel water cooling box, in circulation with the boiler, fitted along the combustion chamber just above the grate level, to prevent adhesion of clinker.

MODERNISING TURBINE PLANT.

IN view of the fact that the performance of modern plant is greatly superior to that of older units, even of fairly recent design, it often does not pay to keep the latter in service. The scrapping of the existing plant is, however, in some cases hardly justifiable, as the electrical equipment and the condensing plant are, as a rule, still in good condition, so that the boiler and steam turbine alone need to be replaced.

As the power developed with the same quantity of steam under modern conditions is considerably higher than in former days, the electrical plant is, consequently, too small for the new turbine; the latter has, therefore, to be built in two parts, the low-pressure portion being coupled to the existing generator and the high-pressure part to a new generator. As, however, it is more especially the high-pressure stages of old turbines that work with a low efficiency, a simple solution is to retain the existing turbine while transferring at least the first high-pressure stage to a back pressure turbine working in series with it—an arrangement adopted by Oerlikon, Ltd., and described in Bulletin No. 84/85, which they recently issued from 28–31, Essex Street, Strand, W.C.2.

As the generator coupled to the existing turbine would no longer be fully loaded if the quantity of steam remained the same as before, the back-pressure turbine is designed to supply an increasing quantity of steam to enable the existing turbine to develop its full output, although the high-pressure drop is cut out; the quantity of steam can be raised to that corresponding to the overload capacity of the old set, as the existing condenser is always dimensioned for such conditions.

With combined power plant of this description, for which the Oerlikon company have recently been granted a patent, it is claimed that it is possible to increase, in many cases, the continuous rating of existing plant by more than 25%, while at the same time obtaining a considerable improvement in steam consumption per kWh generated. On the other hand, the firm claims that capital expenditure is reduced to a minimum, as the original generating plant and condenser remain in service, the only addition to the installation being an h.p. back-pressure turbo-set with the necessary h.p. boilers.

GENERATING PLANT PROGRESS.

Recent Developments in Turbo-Generators—Direct Generation of Alternating Current at High Voltages—Difficulties of Low Voltage Development.

TWO interesting papers dealing with generating plant design and operating problems were read at a meeting of the Institution of Electrical Engineers in London on March 21st. One, on the "Direct Generation of Alternating Current at High Voltages," was by Sir Charles A. Parsons, F.R.S., and Mr. J. Rosen, while Mr. J. A. Kuyser was responsible for "Recent Developments in Turbo-Generators."

In the first-named paper the authors began by pointing out, with the help of a mechanical analogy, the true place which the alternating-current transformer takes in the group of plant considered to-day to be standard for the generation transmission and distribution of electric power on a large scale.

They proposed the use of high-voltage alternators, and the partial abolition of transformers. In support of these proposals, the authors discussed the gradual growth of conditions favourable to the introduction of the high-voltage alternator, and described the obstacles in the way of further development at lower voltages.

This discussion led naturally to the advantages to modern alternator design to be derived from the acceptance of the principle of direct generation at high voltages.

Apart from the design of the alternator itself, including its cable leads, there were many ways in which the adoption of such an alternator would effect financial economy in capital outlay and running expenses, and these matters the authors proceeded to set out.

They then took a brief survey of what has already been done in the past in the field of direct generation at 30 000 V, and described in detail a 33 000 V, 25 000 kW, 3 000 r.p.m. alternator of unique design, built for the North Metropolitan Power Supply Co., for installation in the new power station at Brimsdown, North London. The operating experiences on site since the setting to work of the alternator in August, 1928, were stated.

As a matter of interest to those engineers and designers engaged in alternator construction and development, an outline was given of some of the experimental research carried out by the authors in the working out of the practical details of the new design, and of the tests made at works on the completed alternator.

The paper concluded with some reference to the future possibilities of the extended use of direct generation at high voltages, and the authors asked for a candid expression of opinion from their critics.

Mr. Kuyser first dealt in his paper with the subject of ventilation, the different systems used in the past, and recent developments, being reviewed. Radial, axial, radial-axial and multiple-inlet systems were referred to and internal and external fans were discussed.

The elimination of eddy currents was next considered, the various methods, past and present, being reviewed. These included: Twisted and transposed windings; twisted and transposed slot conductors; twisting and transposition of end-connections; combination of transposed slot conductors and end-connections.

Stator End-Connections.

The paper then dealt with the magnetic field of stator end-connections and discussed the following matters: Local heating produced in end of core, stator end-plate and stator end-connections; measurements by exploring coils under different load conditions, i.e., leading load, lagging load and short circuit; effect of squirrel cage located between stator winding and rotor coil-retaining rings of single-phase generator; neutralisation of end-field by copper screening plate.

In the next section the subject of insulation was treated, the following being considered: Vibration of conductors; swelling of insulation; smooth core design; expansion and contraction of armature conductors; crinkling of insulation; bakelised conductors; clamping of stator winding.

Rotor forgings were discussed, especially in connection with the relative advantages of oil-quenching and annealing.

Finally the subject of coil-retaining rings was dealt with, and the method of support, difficulties due to rigidly supported rings, and non-magnetic rings were discussed.

The author's conclusion was that the experience obtained with the large sets manufactured during recent years has been very satisfactory, and that the rate at which progress has taken place in the size of units manufactured has not been so rapid as to give rise to serious difficulties. Considerable further increase was to be expected in the maximum size of units which could be built for 3 000 r.p.m., whereas for 1 500 r.p.m., sizes were limited only by manufacturing and transport facilities. For 3 000 r.p.m. a desirable size of unit at present would be 50 000 or 60 000 kVA, whereas in a few years a unit of double this capacity could probably be produced, depending upon the progress made in rotor forgings and upon the maximum safe journal dimensions, both uncertain factors. It was added that sets of 50 000 kVA at 3 000 r.p.m. were actually tendered for two years ago.

THE DISCUSSION.

Capt. J. M. DONALDSON, called upon by the President as "the dog on which this 33 000 V alternator is being tried out," said that Messrs. Parsons had not done themselves justice in the paper in the reference that had been made to the enterprise of the North Metropolitan Electric Power Supply Co. Most of the big financial risk had been taken by Messrs. Parsons, and he felt it was right that the circumstances should be made known. The Power Company had ordered two 11 000 V machines, and Messrs. Parsons had suggested that they should build a third "buck-shee" machine for 33 000 V, which was to be interchangeable so far as the turbine was concerned, with the 11 000 V machines, but there was no obligation to take over the 33 000 V machine, even though it proved successful in operation, until the Power Company had the load for it. This showed that Messrs. Parsons had the greatest confidence in their work, because it had meant a large amount of capital lying idle for a long period, to say nothing of the development charges on such a machine, which must have been considerable.

Reference was made in the paper to the very serious gruelling which the machine had had in the matter of surges, and although he did not wish it to be supposed that the Power Co. was sufficiently altruistic to arrange these surges to suit the machine, he hoped, on the other hand, that it would not be supposed that the conditions mentioned were the common lot of people operating off the North Metropolitan system. It had happened by a remarkable run of ill-luck that there had been a most extraordinary series of difficulties on the company's 33 000 V system. It so happened that they had some 50 or 60 miles of 33 000 V overhead lines north of Brimsdown which were connected to mains of another system, and whilst there had been trouble on his own lines from insulators there had also been some trouble from the other lines with which the system was interconnected.

As regards the actual savings, these amounted in capital cost to £5 400, a figure arrived at by deducting the cost of the transformers from the cost of the 33 000 V generator, together with certain savings in cables by using the higher voltage and a small amount for the foundations of the transformers which were not required. Assuming the 33 000 V machine had not a less efficiency than the 11 000 V machine, then the losses in the transformers would have to be reckoned against the 11 000 V machine, and on the basis of the figures in the paper these would represent £763. Capitalising this in the way done in the paper, the amount was £7 630, making a total of a little over £13 000.

As to the operation of the machine, when people said they would like to see it, all he could say was that there was nothing to see except a very nice name plate. He had been rather alarmed on one occasion by smelling ozone, but the manufacturers appeared to be very confident that there was no danger of gases being given off in this way. If the ozone question became serious he believed it was a simple matter to bring it back to the allotropic form. Up to now, however, the machine had been running under hard conditions quite satisfactorily.

The PRESIDENT, in calling upon Mr. A. B. Field, congratulated him upon being awarded the Lamme medal by the American Institute of Electrical Engineers.

Mr. A. B. FIELD said that, given equal resources, he did not think there was any question but that a low voltage machine could be designed with better efficiency than a high voltage machine, of the same output. Moreover, on the

Digitized by Google

question of reliability, conservatism would probably dictate a high insurance figure for the high voltage machine until more experience was gained. As regards insulation, the difficult part of the problem with the 33 000 V machine would appear to be in connection with that part of the winding external to the core. The fundamental issue in connection with the high voltage machine was getting the heat through the thick high voltage insulation, and it seemed to him that a much bolder attack than that made by the authors was justified.

Mr. Field advocated the oil-immersed stator, and said that if we could make up our minds to go in for oil immersion it would be possible to get the cooling medium practically in direct contact with the high voltage metal, or with only small thicknesses of solid insulating material. He had in mind high speed forced circulation such as was the case in condenser tubes. Even hollow conductors might be feasible with oil cooling. Of course, a large expenditure of money would be necessary to perfect the design, but there were no absolutely fundamental obstacles in the way which would make it absurd to investigate such ideas. Mr. Field exhibited some slides showing diagrammatically the ideas which he had in mind.

Question of Forgings.

Mr. H. W. TAYLOR, speaking with regard to the suggestion that the art of forging is at present preventing us going farther with machines of the type described in the paper by Sir Charles Parsons and Mr. Rosen, said that whilst electrical problems and mechanical design are well understood, we were waiting for the forging maker to make sound forgings from known materials and to produce materials which would have higher strengths than those now common; and when that was the case it would not be long before we had machines of a higher rating than that mentioned. At the same time he believed there would be a demand for some years for machines which were rather outside the accepted range of high speed. Incidentally, he wondered why designers of 1 500 r.p.m. machines had not considered the fabricated type of rotor more than they had done hitherto. One firm in America had specialised on these apparatus, and there was also one firm in England, but the design in the two cases was rather different.

Mr. G. W. PARTRIDGE spoke of the troubles experienced with the early 11 000 V system at Deptford. In those days, however, the oil transformer was not known, whereas to-day the oil transformer was probably the most reliable piece of apparatus on the system. Machines of the type described by Messrs. Parsons and Rosen were subject to a number of drawbacks. There was first the question of brush discharge. It was very difficult to design such a machine which was absolutely free from brush discharge, which, in some cases might take months or even years to deteriorate the insulation. Again, with such a machine there was no buffer between the machine winding and the high tension transmission system, with consequent risk of damage to the external portion of the stator. Further, another drawback was the actual cost of the failure of such a machine as compared with the failure of a transformer. There would be no comparison between the time taken to put a transformer that had failed back into service and the time taken to put such a high tension alternator into service again in similar circumstances. In the one case it would be a question of a few hours, whereas in the latter it might be three or four months—if there had been a burn out—and there would be the loss of the use of some thousands of pounds' worth of plant in turbines, condensers, etc. The use of auto-transformers was the right method to adopt with these machines because, if judiciously designed, they would halve the capital cost, the space required and the losses.

Mr. J. A. JUHLIN said that progress was never made without experiment, and a good deal more experiment was required with the 33 000 V machine. He would feel a little misgiving if there were a wholesale adoption of it at the present stage. He felt Messrs. Parsons and Rosen had painted a picture of the low voltage machine rather blacker than it deserved, because he had installed large machines of this type carrying almost the current mentioned by the authors. He suggested to the authors that it would be necessary solidly to earth the neutral, otherwise, if it were earthed through a resistance or by any other means, and a fault occurred near one of the terminals a voltage would be put upon the outer conductors very much higher than they were designed for, in the event of using the graded insulation mentioned by the authors, and auto-transformers as mentioned by Mr. Partridge. The results of the experiments upon insulation were interesting, but they were not complete, and there were indications from the study of the figures given that considerably better results could be obtained. His firm had for many years advocated the method of compressing the mica to such an extent as to get the maximum amount of mica into the space.

Mr. W. H. PATCHELL said that in December last he had the pleasure of sending a contribution to the National Electric Light Association Prime Movers Committee on foreign developments, and the particular 30 000 V machine described in the paper was the star turn for 1928 and would undoubtedly get into the American journals later on. He was very glad to think that, however big the Americans were making their machines, we did not allow them to trail every engineering improvement, and that the old country kept still just a little bit ahead. There had been an immense improvement in insulation during the last 25 years. He was glad to hear that his old competitor, Mr. Partridge, was still going strong at Deptford, because the first 10 000 V single-phase machine was installed there, whilst his own machines at Bow were the first 10 000 V three-phase machines, he believed, in the world at the time they were installed. He was not sure whether there was one at Buffalo at the same time.

When the Bow machines were described at the Institution everybody held up their hands in horror and said that they would be nitrogen factories. As a matter of fact, he believed Mr. Highfield, at Willesden, on other machines, had had this trouble, and the difficulty was to make solid insulation. Considerable advances had been made during the past 25 years, however, and the next 25 years might see similar developments. Sir Charles Parsons was sincerely to be congratulated on the real step in progress that he had made.

Mr. J. S. HIGHFIELD said Mr. Partridge had put his finger on a very practical and serious matter when he spoke of the expense of losing the service of one of these very large machines, and the designers and makers of these units would have to manufacture them so that there was no possibility of a breakdown. Mr. Patchell had said that the Bow machines did not produce nitric acid, whereas the Willesden machines did, but in the Willesden machines there were certain reasons for what took place. Nitric acid—really ozone—was made with nitrous oxide, and eventually sulphuric acid, because the coils were insulated with a gypsum soap coating, and burned themselves out in six months, the high tension windings going first. That failure, however, was really of the solid insulation for conductors, which was very important, as Mr. Patchell had said.

Mr. J. W. TOWNLEY spoke of the horrible arrangement of machines with an exciter's exciter, making a long machine still longer. No reference had been made to this matter in the paper by Mr. Kuyser. Another omission in that paper was the absence of any reference to temperature rise. A few years ago there was a heated controversy over temperature rise, and it was clear that many people did not know the temperatures in their machines. Therefore it would have been interesting to hear something as to whether the temperatures that machines were running at to-day were too high or too low.

Owing to lack of time, only brief replies were given to the discussion.

POST OFFICE ACCOUNTS.

Over £7 500 000 Surplus for Year Ended March 31st.

THE Post Office commercial accounts for the year ended March 31st, 1928, show a surplus of £7 570 348, after charging interest on capital, or £1 750 000 more than that for the previous year. The profit on the postal department was £8 843 786, while the surplus on telephones was £107 391, compared with £283 375, and the deficit on telegraphs was £1 380 829, or over £31 000 more than in the previous year. Cash receipts from wireless licences were £1 234 898, and after deducting £154 362, or 12½% for expenses of management and £1 427 as contributions to cost of conversion of spark stations, £1 079 109 was left. Of this £824 237 was paid to the British Broadcasting Corporation, the balance of £254 872 accruing to the Exchequer. The wireless telegraph services accounts now include the working of the wireless services recently established with the Dominions by means of the beam system. The Comptroller and Auditor-General points out that, although the account does not cover a full year's working for all four services—with Canada, Australia, South Africa and India—it appears that the operation of the beam services showed a net surplus of £89 473 in the year. The Imperial Cable Service accounts show a deficit of £77 122, against a deficit of £40 789 in 1926.

MARINE ELECTRICITY.

Electricity and its Uses in and on Small Ships—Why not Electric Lightships?—An Important Small Motorship, Electric in Everything but Propulsion, with a 330 kW Auxiliary Load—Use of the Storage Battery.

By A. C. HARDY, B.Sc., A.M.I.M.E. (Author of "Motor Shipping," "Merchant Ship Types," etc.)

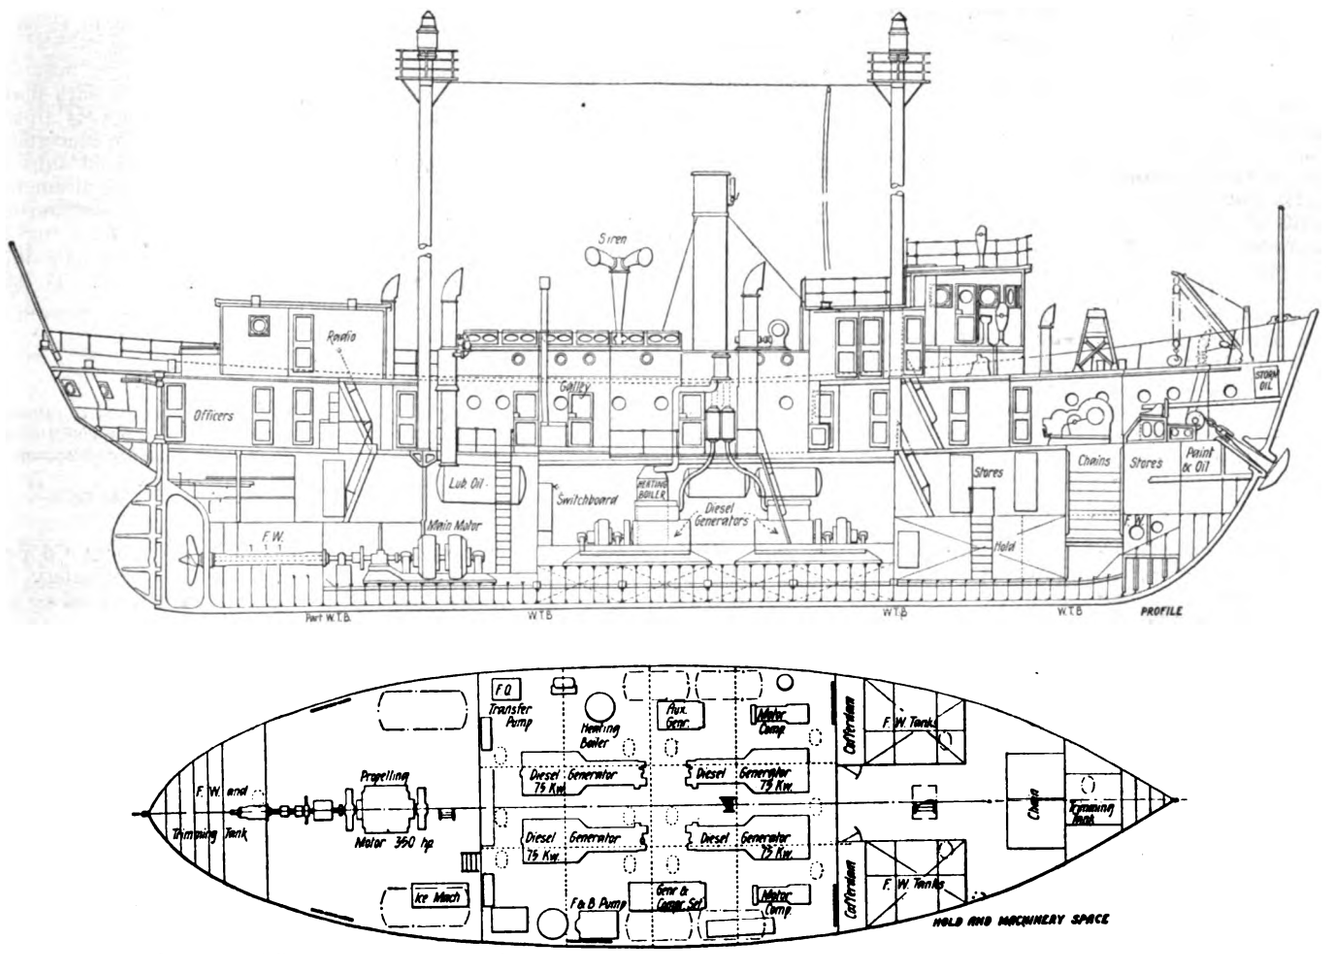
THE recent sinking of the Gull Lightship in a severe fog by an inward-bound liner, sailing from Calcutta, serves to recall that many of the lightships round our coasts are among the oldest ships now in commission. It serves, too, as a useful opportunity for the suggestion that the possibilities of marine electricity be taken into account by Trinity House when designing new ships of this type. We have a precedent, too, to plead in this case because it is just a year ago that the U.S. Bureau of Lighthouses ordered a batch of modern steel light vessels in which the whole of the power required for lighting and propulsion was obtained from electric generators driven by small Diesel engines. These ships were unique in that they were the first of their kind in the world.

The requirements of British lightships are somewhat different, but the root idea is the same and well worth consideration. Because, after all, whether or not a lightship is self-propelled she needs power for a number of important duties—duties to which propulsion is actually secondary. These include the provision of compressed air for operating fog syrens, power for pumping out the various compartments into which the ship is divided, and in certain modern vessels for the lanterns themselves. In American waters, it has always been thought good practice to fit lightships with self-propelling machinery, partly because the ships in many cases ride to their cables in very exposed positions and power enables them to take the strain a little on the cable in heavy weather and partly because, if they break adrift, they can take care of themselves without becoming a danger to navigation. Then, too, power within the hull enables lightships to proceed to and from their station without the aid of tugs.

There is much to be said in favour of this for British lightships, many of which are in positions almost as exposed as American lightships. Outside of British ships, the practice of fitting power to lightships is followed a good deal, but invariably with direct drive; which is a mistake, because obviously, the main propulsion machinery is idle for the greater part of the ship's active career. An electric motor, on the other hand, is a much smaller piece of machinery, always available when wanted, while the main prime movers driving generators to supply current for other important duties on the ship are practically in continuous use.

The thought is an interesting one to develop, and this may be done by a consideration of the power plant of the ship illustrated herewith. The ship has a waterline length of 108·75 ft., a moulded beam of 30 ft., a depth of 15 ft., and a displacement of 630 tons. Inside this small seaworthy hull is locked up quite a well-arranged power plant, as will be seen. In a power room amidships there are four generator sets. Each generator is direct-connected to a 112 B.H.P. four-cycle single-acting trunk piston Diesel engine turning at 450 r.p.m. The generators are of open direct current type, compound wound for auxiliary power and shunt wound for propulsion. Each generator develops 75 kW at 125 V and 450 r.p.m.; full power is not generated at speeds below 450 r.p.m. The engines driving the generators have governors which regulate their speed from no load to full load within 3 % of normal.

These generator sets provide power for the whole of the services on the ships, including two powerful electric lanterns on steel masts. There are also an electrically-driven fire, deck, and bilge pump, an electrically-driven fuel oil transfer pump, a high pressure air compressor for starting air for the main Diesels, two low pressure compressors for the fog signal, a powerful electric windlass, a boat hoist, and an electric refrigerating plant. For actual propulsion purposes there is—in a separate compartment at the aft end of the ship—a 350 H.P. double armature motor. It is of open, direct-current, shunt



The recent sinking of the Gull lightship suggests the possibilities of a more extensive use of electricity on ships of this class. Above is an example of a modern all-electric self-propelling lightship.

Digitized by Google

wound type, separately excited from the 125 V excitation bus. It develops its power with both armatures in series, at 300 r.p.m.

It will thus be apparent that these lightships are small electric ships closely comparable in size with certain tugs—also of electric type. The comparison is interesting and may well be considered at a time like this when a British tug owner is currently reported to be considering the construction of a Diesel-electric tug in the near future. This would be the first of its kind in this country, although in America electric tugs have been in successful operation for some time. On the score of first cost, we must perhaps confess that the Diesel-electric tug would not be as attractive a proposition as a steam tug. It may be taken as a truism that any modern improvement costs more than the item over which it is an improvement. It is, however, on the operating cost that the saving is made. This statement is interesting and instructive to convert into figures. A certain 650 H.P. electric tug owned by a railway company costs, when new, £28 000. A steam vessel of the same power and performance costs £23 600, or £4 400 less. But the annual fuel cost for the steam tug amounted to £5 114 for the first year, and a comparison of the total annual operating costs, including interest and depreciation shows a saving of £4 200 in favour of the electric vessel. In other words, owing to the economy of operation, the extra cost is—with the exception of £200—paid off as a result of the first year's working.

These figures are important because they are a definite answer to the criticism that the Diesel-electric tug is expensive to build, and to operate. Operating bills naturally depend upon the type of prime mover selected to drive the generating sets and upon the class of operating crew selected. The point should here be made, however, that in a Diesel-electric ship of small type the duties of the operating crew are extremely light, being confined mainly to attending to the simple needs of the single-acting non-reversing, trunk piston type main engines. All manœuvring is done from the bridge, so that here again the man on duty in the engine room it not bothered with the continual jangling of signal bells from the pilot house. The pilot, or captain, on the other hand, is secure in the knowledge that his vessel will answer as swiftly as a tramcar or an electric train answers the control handle.

Tugs are not Ships.

As I have pointed out previously in these articles, tugs and ferry-boats cannot, and should not be considered as an ordinary ship powering problem. They are floating tramcars or shunting engines—whichever you will. The point should be again emphasised because it does not appear to be generally recognised. The electric motor at the end of a propeller is almost ideal for this purpose. It is actually better for towing work than a direct-coupled Diesel engine because the latter turns at a rate of revolutions which is rather high for certain types of towing work. Then, too, with a Diesel-electric vessel the engines can be of short stroke, high speed, lightweight type. Furthermore, they are non-reversing and hence all manœuvring air compressors and a great deal of piping and manœuvring air tank storage are eliminated. The electric arrangement makes for compactness.

As showing the difference in propeller dimensions with different types of propulsion for tugs, it may be mentioned that a direct drive motor tug had a propeller of 7 ft. 6 in. diameter and 5 ft. 9 in. pitch, while a corresponding steam tug had a propeller 9 ft. in diameter and 12 ft. 3 in. pitch. The corresponding electric tug had a propeller 9 ft. 6 in. in diameter and 9 ft. 4 in. pitch. The propeller of the direct drive motor tug is evidently designed for much faster running than either of the other two. The electric motor propeller operates at 125 r.p.m. The motor itself develops 575 S.H.P. A corresponding direct drive internal combustion engine turns at about 275 r.p.m. Comparison of different small electric ship particulars on a basis of length of ship shows some interesting ranges of sizes and outputs. They may be conveniently arranged in tabular form.

ELECTRICAL OUTPUT ON VARIOUS SMALL SHIPS.

Type of Ship.	Tug.	Light-ship.	Tug.	Tug.	Yacht.	Passenger ship.
Length of ship ..	105 ft.	108·7 ft.	108 ft.	97 ft.	210 ft.	345 ft.
Number of generator sets ..	2	4	2	2	4	4
Diesel power per unit ..	400	112	400	225	Various	Various
Generator output ..	235 kW	300 kW	270 kW	—	129 kW	337·5kW
Main motor power ..	575	350	650	370	—	—
R.p.m. (shaft) ..	125	300	120	120	—	—

It may be noted, as an instance of the way in which the speed of rotation in a marine electric motor can be absolutely fitted to the duties required of it, that the main propelling motor in the lightship develops its total (350) horse power at 300 r.p.m., while the tug which has 370 S.H.P. develops its power at 120 r.p.m. In the latter, the propeller is an important part of the whole, whereas in the former the propeller is merely fitted as a convenience in order to get the vessel to and from her station at just about sufficient speed to give her steerage way. Propelling requirements are definitely secondary to main propelling requirements in this case.

The first four ships are electrically propelled. The second two are modern electric ships, in which the whole of the auxiliary services, except the main propulsion services, are carried out by electricity. Comparison of the electrical output, therefore, is not without interest either as showing how powerful are the tugs or how completely catered for electrically are the yacht and the cross-channel passenger ship. Both of these two latter ships, it should be mentioned, have storage batteries fitted for various auxiliary duties. On the yacht, batteries are arranged to run lights, fans, and small plant with everything shut down when the ship is in port. Another interesting feature of the ship is the adoption, in connection with these (Edison) battery sets of what amounts to a train lighting set, because there is a 13 kW Crompton Parkinson generator driven by chain and clutch from the starboard shaft, which rotates normally at about 160 r.p.m.

Emergency Batteries.

On the big cross-channel vessel, an emergency battery set is arranged to operate the electric-hydraulic steering gear in the event of a complete breakdown of the normal sources of supply on the ship, in which electricity is used extensively for heating, lighting, cooking, and auxiliary machinery requirements both on deck and in the engine room. For comparatively small-sized ships the auxiliary generator equipment is a large one, there being three 160 kW generator sets, each driven by a six-cylinder airless injection four-cycle Diesel and one 7·5 kW emergency generator set on deck. In addition to the electric steering gear, deck winches, and windlass (controlled, incidentally, on the Ward-Leonard system), electrically operated watertight doors are fitted. There are also electric helm indicators, revolution indicators for the main engines, and even electrically operated syrens. Electric pyrometers measure the exhaust gas temperatures from the main engines, a telephone service is fitted throughout the ship, and connection can also be made with the land line systems ashore at each of the two terminal ports at which the ship touches.

The question of electricity on shipboard, then, we may see very clearly, is one which neither begins nor ends with main propulsion, although this is a field which is as yet largely unexplored as far as small craft, in this country, are concerned. It is abundantly clear, however, that a small-sized ship of modern type has to-day purely for her auxiliary requirements an electrical power station which in output is greater than that required for the electrical propulsion of an up-to-date tug or for the complete power requirements of a modern lightship. Ten years ago this would not have been the case. To-day electricity is literally 90% of the ship.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"The Factor of Safety of Overhead Lines."

[TO THE EDITOR.]

SIR,—Under the above heading Mr. W. Fordham Cooper, in your issue of March 22nd, discussed factors of safety for the conductor material and touched on factors of safety for supports.

As regards the wood pole, it is unfortunate that its strength is referred to as the strength of its foundation. Haphazardly made foundations have no doubt been too common a practice for the ordinary wood pole, and there is much evidence that, as we reach out to the massive steel structure, precautions aim at over-strengthening the foundations. The *real* strength of a support is not the strength of the foundation, although the strength of the latter (by error or otherwise) too often places a limit on the actual available strength of the pole. There would seem to be little need for a tornado, blizzard, or the like, while we under-estimate the strength of foundations yet build the above-ground parts according to loading conditions and rules. And, seeing that the ordinary wood pole covers almost the same below-ground area (for equal depth) as a compound pole, there would seem to exist less reason for allowing a weakness of the former, while full strength is

Digitized by Google

made, at much greater cost, for the latter (assuming that Mr. Cooper is really alluding to Mr. Woodhouse's paper read before a meeting of the I.E.E.). If we earnestly intend to test and obtain the real and available strength of anything (say, a single or compound wood-pole), why fail " to make the whole chain " strong enough to produce the just and truly available strength of the thing tested ?

With reference to steel for overhead lines, *three* different factors of safety have been adopted, namely, 2·0 for steel conductors, 2·5 for all-steel structures, and 3·5 for steel-reinforced concrete poles.

On this point the writer takes the opportunity of completing his recent suggestions (see THE ELECTRICIAN of February 8th, 1929, page 166) for factor of safety of reinforced-concrete poles. Why provide 3·5 when 2·5 is considered ample for unsupported steel ? In a well-designed reinforced-concrete pole the steel is braced for the bending moment, and the factor L for ratio L/R is made very short indeed. The steel and concrete are such that following rupture there is still a substantial factor of safety left. Certainly, of the two materials, concrete is the most inconsistent and may be of relatively little strength value for certain shell-type (hollow) poles, yet be of very great strength value for solid poles of the " I," rectangular, elliptical, square, and certain other shapes ; the three former shapes permitting of very great strength and offering low resistance to winds.

The writer suggests that the values already allowed as British Standards for steel and concrete be substituted for reinforced-concrete in the place of 3·5 ; that is to say : ·

Factor of safety for the steel	2·5
Factor of safety for the concrete.....	4·5

The former is strong in tension but weak in compression, and the latter is strong in compression but weak in tension. The two factors should be separated and a greater strength factor provided for the concrete, the strength of which is more variable than the strength of steel.

The strength of concrete for poles varies with the types and methods of making, and whether formed and cast *in the actual final positions in the line*, or, formed and cast far from the sites, method of handling, transport, haulage, erection, etc. The factor of safety of the pole may in many cases quite reasonably be increased by 2·0 to allow for weakness from handling, transport, haulage and erection. What we have long desired is a competitively cheap and sound reinforced-concrete pole, formed and cast right in the final position it is to take up in the line.

For such a pole the writer has succeeded in making a close study, the merits for which are summarised as follows :—

(1) A steel reinforcement and disposition for pole, fixtures and foundation, to most economically balance or level-up the pole strength on parallel faces, independent of the pole shape, and always with much greater strength in the direction of the greatest stress whether for transverse or longitudinal directional forces. This provides not only the most economical amount of steel exactly where it should go for highest strength requirements, but it also provides a levelling-up of the steel to afford maximum economy with maximum strength.

(2) The erection of the form (complete or in part) and the casting of the pole, frame or structure, or/and fixtures (arms and so forth) or/and foundation, *all* in the actual final positions on the line, and so done that no scaffolding nor superstructure is required for any of the operations. The ever present danger of fracture or weakness as well as the excessive costs by transport, haulage, handling, and erection, all have been cancelled out. These dangers and high costs cripple the more extensive use of reinforced-concrete poles from a competitive standpoint, and, by a cancelling out of the ever present danger of fracture or damage, a more favourable factor of safety is allowable. Apart from this, a solid and much stronger and reliable pole is possible at less cost, and, the concrete will attain a greater density and strength (particularly at those points where the greatest strength is most required) than the same pole cast horizontally ; it is puddled or/and tamped in the process of erection, and the concrete is pressed tight and weighted downward so that it hardens and possesses less moisture-content due to the heavy vertical concrete mass. The pole is further strengthened by casting its foundation directly against undisturbed natural ground without any filling-in or falling-in of earth because the foundation forms the first operation, and not the last as with practically all other methods.

(3) The arms for insulators are metallically bonded internally to the steel of the pole and the foundation. They are of a form permitting of the three chief requirements, namely : *total* freedom from bird troubles ; the *lowest* possible reduction in calculated height of load application (which allows of a relatively slight reduction in the factor of safety) for *highest* possible elevation of insulator-base above ground-level ; use of single, or double insulators in parallel (required for main roads and crossings) or in series, or both. The entire steel reinforcement (fixtures, pole and its foundation) is bonded and is well earthed, and sealed outlets are provided (as desired for plugging-in) for earthing any line-equipment without the necessity of exposed or encased wires running over any part of the pole.

The above explanations (1), (2) and (3) define this reinforced-concrete composite construction which merits a study by all intending to build, extend or re-model existing wood-pole lines.

As regards the conclusion (4) by Mr. Cooper : Compared with a line or lines, which usually are in some remote area or crossing private grounds, would Mr. Cooper consider the danger and loss conditions anywhere near equal to those from h.t. crosses with secondaries ? For all weather conditions and for every second in the year and all years would Mr. Cooper recommend that the millions of secondary connections to lamps and devices in houses and factories, etc., be exposed to the possibility of the same kinds of h.t. crosses ?

As regards the first question, it is obvious we cannot design lines to stand up to such conditions referred to by him ; as regards the second, we cannot with truth say it is impossible for such a thing to happen on any overhead network where h.t. and l.t. run on the same poles, or where h.t. lines cross service leads, or where transformations are used. In order to obviate or reduce the possibility of hazard to life, and, not have " the lay Press hold him responsible for manslaughter " what step should be taken ? Why are we not doing it ? It is necessary to forget entirely about comparing communication interference with life—there is no comparison. Must we leave it until someone dear to us is electrocuted and have it recorded that we who are paid to know and act were responsible ? Life comes first, and " *enough* " protection must be enough, or we, as engineers, fail in our task and duties.—I am, etc.,

WILLIAM T. TAYLOR.

London.

" Glass Insulators."

[TO THE EDITOR.]

SIR,—With reference to the letter on this subject in your issue of March 22nd, I have already had occasion to observe that the methods of reasoning followed by Mr. North are, to say the least of it, peculiar. I would not, however, have anticipated that Mr. North could have construed my statement regarding the deleterious effects of partial arcs, into an argument emphasising the value of a polished and glazed surface for insulators.

Without wishing to decry glass insulators, I am nevertheless compelled to point out that any damage done by the discharges referred to is almost entirely the results of intense local heating, which is notoriously more dangerous to glass than to porcelain. With apologies for extending this correspondence.—I am, etc.,

B. L. GOODLET.

" Electrical Firms and the B.I.F."

[TO THE EDITOR.]

SIR,—While I agree with most of the suggestions put forward on your correspondence page last week, I think your correspondent is unduly " Hopeful " to expect such radical changes to be made in time for next year's Fair.

In any event, he has omitted the most important of all the desired changes—i.e., that of date, though possibly he is not so hopeful about obtaining this eminently desirable alteration as he is about the comparatively minor details which he enumerates.

For several years past electrical firms have pointed out the futility of expecting to attract many foreign buyers in February. These criticisms have usually been met with a promise to take a referendum of exhibitors, but I do not recollect having seen any detailed results of such a questionnaire. I therefore suggest that this date question should be settled once and for all by a ballot of the electrical firms concerned, and that the results should be published.—I am, etc.,

" DOUBTFUL."

Liverpool.
April 2nd.

[Other letters are unavoidably held over.—ED.]

NEWS IN BRIEF.

Railways and Electric Lighting—Mr. Lloyd George and the P.M.G.—Fire at Paignton Electricity Works—Hull and Assisted Wiring.

THE fourteenth Guthrie lecture will be given before the Physical Society on April 19th by Prof. P. W. Bridgman, the title being "Elements under High Pressure."

The Mid-Gloucestershire Branch of the Electrical Association for Women held a meeting on March 22nd, when Mr. R. A. Parson gave a lecture entitled "Bells and Batteries."

The recent electrical exhibition at Preston was attended by 11 000 persons.

Electrical goods and apparatus will be shown at the Zagreb Trade Fair, Yugoslavia, which will be open from April 20th to 28th.

Battersea (London) Housing Committee recommends that the gas fires fixed by the Council in the bedrooms of the tenements on the Latchmere, Heathwall and Savona Street assisted housing estates should be replaced by electric radiators.

At last week's meeting of the directors of the Glasgow Chamber of Commerce, Major John Colville, Convener of the Advisory Committee on Telephones and Telegraphs, stated that there had been a satisfactory increase in the number of residential telephones in the Glasgow area, but an unusual falling off in business telephones.

At a recent meeting of the Lighting Committee of Brighton Corporation the Engineer submitted a drawing showing the control kiosk for the new semaphore signalling arrangements at the foot of New England Road. It is proposed to erect a lattice mast, in place of the heavy cast iron post which was embodied in the original design, on the grounds of lightness and strength, and to fit five lamps in all, one at the top of the post with four around and beneath it.

A meeting of the Institute of Fuel will be held at the Chemical Society on April 10th, when Major W. Gregson will give a lecture, entitled "Some Notes on Waste Heat Recovery." Mr. Frank Hodges will be in the chair.

The last of the evening lectures of the Electrical Association for Women, for this session, was given on March 19th by Mr. F. Bourne, his subject being "Some Electrical Facts Concerning Electric Motors." Miss Dorothy Vaughan was in the chair.

The Great Western Railway has decided to convert the existing gas service at 24 stations in the Newport and Cardiff division to electricity; the station at Gobowen and the locomotive shops and yard at Oswestry are to be similarly converted.

At the annual meeting of the West Lewisham (London) Chamber of Commerce, last week, Mr. E. J. Ward, assistant secretary, said he was co-operating with Sir Philip Dawson, M.P., with a view to securing a reduction in the price of electricity for power and light in parts of West Lewisham.

Speaking at Alderley Edge last week, the Postmaster-General denied Mr. Lloyd George's statements that the leeway in telephone development resulting from the war was not being made up, and that the growth of the telephone organisation had been retarded by any restriction by the Government on funds available for development. Last year plant was provided on the basis of an increase of 140 000 subscribers, whereas the net increase, although a record, did not exceed 125 000.

Torquay Corporation invites applications for the position of borough electrical engineer.

On March 22nd a rotary converter, valued at £1 000, at the Paignton electricity works, was destroyed by fire.

For the convenience of visitors, a through telephone circuit between London and the Paris Plage was provided during the Easter holidays.

Wimbledon Electricity Committee has accepted a tender amounting to £405 18s. for the erection of a sub-station in Franks Avenue.

At a recent meeting of the Association of Mining Electrical Engineers, at Cardiff, Mr. C. L. James, a student member, read a paper on "Power Factor: Its Cause and Effect."

Chorley Gas Committee has approved an estimate submitted by the Gas Engineer for the supply and erection of a 30 cwt. electric crane, operated on a maximum radius of 35 ft., with derricking, slewing and travelling gear, complete with automatic skip, etc.

In connection with the advertising of the forthcoming electrical exhibition, Brighton Lighting Committee has decided to ask the principal of the School of Art to have competitive designs prepared by his pupils, and that prizes of £10, £5 and £3 be offered for the best designs.

Tynemouth Electricity Committee has received from the Electrical Engineer a report with regard to the urgent need for a demonstration house in connection with the electricity department. The matter has been referred to the Chairman, the Deputy Chairman, and the Electrical Engineer for consideration and report.

During the last three months 609 applications for assisted wiring have been secured by Hull Electricity Committee. The number of agreements which have been completed total 259.

Glasgow Electricity Committee has authorised the Manager of the electricity department to purchase 50 electric washing machines to be supplied to consumers on the hire-purchase systems.

Beckenham U.D.C. has decided to erect offices and showrooms for the electricity department on the Rectory site, with frontage to High Street. The designs of Messrs. Lanchester, Lucas and Lodge have been referred to the Electricity Committee.

At a recent joint meeting of the Association of Mining Electrical Engineers with the Institution of Electrical Engineers (East Midland sub-centre), the Nottingham Society of Engineers, and the Newark Engineering Society, at Nottingham, Mr. A. H. Law and Mr. J. P. Chittenden, of the English Electric Co., read a paper on "Some Unusual Power Plants."

A one-day conference of the Electrical Association for Women will take place on April 16th at the Hotel Cecil, London, where, on the same day, a luncheon and a ball organised by the Association will be held, and a cabaret show will also be given during the evening. In the afternoon a party will visit the works of Belling and Co. The charge for tickets for the luncheon (exclusive of wines) is 6s., tickets for the ball (including supper and cabaret) 21s., and combined tickets for the luncheon and ball, 25s. Tickets can be obtained from Mr. Bernard C. Holding, editor of THE ELECTRICIAN, or from the Director of the Association.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *of April 5th, 1879:—*

German railways were experimenting with the use of the telephone on their lines.

There was jubilation at the feat of disposing, within one hour, of 215 telegraphic messages averaging 30 words each on a single wire between London and Birmingham, by quadruplex. The achievement was "unprecedented in the history of telegraphy."

Reporting on the lighting plant used to expedite construction of the Severn Bridge, Mr. W. Brain stated that two dynamo machines were used. One, of Siemens' small size, running at 1 050 to 1 100 r.p.m. was working remarkably well, keeping perfectly cool, and showing scarcely any fire on the brushes of the commutators. The other, a Gramme A size, made by the India Rubber and Gutta Percha Co., was giving equally good results. Both were driven by a small portable engine of 8 H.P. fitted with a very sensitive governor. Two lamps were lighted by this apparatus, one a Serrin and the other a Siemens.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of April 8th, 1904, reported that:—*

Lord Kelvin was elected Chancellor of the University of Glasgow.

Heston and Isleworth Council, announcing the inauguration of its public supply, offered consumers a free supply for the first month. A free-wiring scheme was also offered.

Mr. J. S. Forbes, president of the National Telephone Co., and a former chairman of the Edison and Swan United Electric Light Co., died at the age of 81 years. He was prominently associated with the development of electricity on railways, and was chairman of the Metropolitan District Railway Co.

BUSINESS ITEMS.

EINSTEIN'S Electro-Chemical Process, Ltd. have taken premises for a factory on the Trading Estate, at Slough.

The ELECTRIC HEATING CO., of George Street, Croydon, has secured a large contract for the supply of soldering irons for the Admiralty.

As from to-morrow (Saturday) the address of the GREENWICH CABLE WORKS, LTD., is Mitcham Road, Croydon. 'Phone: Thornton Heath 2882.

Mr. S. DICKINSON, electrical contractor, 70, Newton Street, Manchester, has taken over additional premises at 104, Oldham Road, Manchester. All correspondence should be sent to the latter address.

In connection with the series of village exhibitions which the WESTERN ELECTRICITY SUPPLY CO., LTD., is holding in their West Wilts Area, exhibitions have recently been held at Holt and Lacock.

The BRITISH THOMSON-HOUSTON CO., LTD., Rugby, has received an order from the Metropolitan Electric Tramways Co., Ltd., for 140 type 509 lightweight traction motors. With this repeat order the total number of B.T.H. motors of this type ordered by the Metropolitan Tramway Co. is 354.

The HART ACCUMULATOR CO., LTD., Marshgate Lane, Stratford, London, E.15, announces that "Hart" batteries were used in connection with the recent official demonstrations of the Baird television system which were attended by the Postmaster-General and officials of the British Broadcasting Corporation.

The new turbo-electric P. & O. Liner, the "Viceroy of India," which sailed on March 28th on her maiden voyage to Bombay, is, in addition to carrying main and auxiliary machinery constructed and erected by the BRITISH THOMSON-HOUSTON CO., LTD., fitted throughout with "Mazda" lamps. The sizes of these range from 40 to 300 W.

The EDISON SWAN ELECTRIC CO., LTD., 123, Queen Victoria Street, London, E.C.4, has been advised by Anley and Co., of Fulham, London, that when the collision between a fire engine and omnibus occurred on March 13th, an electric pendant in the shop was shattered but the lamp which had been in use over two years, is still doing useful work.

The SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO. has this year already held demonstration exhibitions at Bewdley, Bridgnorth, Ledbury, Winchcombe, Ludlow, Broadway, and we are advised that the next is arranged to take place in the Town Hall, Oldbury, from April 16th-20th. These exhibitions are supported by electrical installation contractors of the particular district and who are members of the Area Circle.

In connection with the claims for Brush-Ljungström turbo-alternators, the BRUSH ELECTRICAL ENGINEERING CO., LTD., has received through Coulston and Co. Pty., Ltd., of Melbourne, from Mr. P. J. Pringle, the chief engineer and general manager of the Electric Supply Co. of Victoria, Ltd., at Ballarat, a letter to the effect that the 1 500 kW Brush-Ljungström turbo-alternators supplied over four years ago have not, beyond opening up one of them two or three months after it was started up, been examined internally since their erection. Steam consumption figures are still from ½% to 1% better than the original guarantees.

The Birmingham Area, which has been served hitherto entirely by manual exchanges, is now to have automatic telephones. Orders for three automatic exchanges (Northern, Victoria, and Harborne) and also for a tandem exchange, have been placed with the GENERAL ELECTRIC CO., LTD. The initial equipment to be provided on the automatic exchanges is for a total of 9 700 lines, the ultimate capacity being 20 200. The tandem exchange will provide for routing all junction traffic in the area, and will be equipped with keysender positions for use during the change-over. It is anticipated that the exchanges will be brought into operation during 1931.

A replica of the central electric lighting electrolier at the Drury Lane theatre, London, has been ordered by a Chinese Towkay of Kuala Lumpur for installation in his official residence in the East. This fitting, fashioned on classic Empire lines, has a main band 6 ft. in diameter with eight three-light arm clusters, supporting flambeau shades accommodating 60 W gasfilled lamps. The metal work is of cast bronze, polished, and tones down to a dark colour, and it weighs over a ton. The bent glass panels and lower bowl are in satin finish with clear-cut relief. Sixteen inverted reflectors, each designed to house 500 W lamps, are also arranged inside the fitting, and these are supplemented by four 500 W and five 60 W lamps without reflectors. In addition, a number of other electric lighting fittings have been ordered, for which an initial contract exceeding £2 000 in value has been placed with the Kuala Lumpur Branch of the GENERAL ELECTRIC CO., LTD. The whole of the fittings referred to will be manufactured in the Birmingham works of the company.

The electrical effects for the Mayor's reception and ball at the Leyton Town Hall last month were carried out by the Corporation Electricity Department under the supervision of Mr. Wetherell, borough electrical engineer. The awning at the entrance to the Town Hall was picked out with multi-coloured strip lighting, the entrance and main staircase were provided with suitable shades and modern floodlighting. The main hall had streamers of fairy lights intermingled with autumn leaves run in festoons, the general lighting being carried out in colour-sprayed amber lamps. Spot lights were introduced with coloured screens giving changing colours and floodlights for general effect, while in addition special apparatus was provided which gave various effects, such as snow, fire, clouds, waves, moon, etc. In the centre of the hall a large electrically-driven mirror bowl was suspended and while a concert was being given various coloured flood and spot lights were provided. Much of the apparatus employed in this scheme such as the spotlights, orchestra lights, coloured strips and reflector lighting, as well as the Osram amber colour sprayed lamps and the exterior floodlights were supplied by the GENERAL ELECTRIC CO., LTD.

PERSONAL.

MR. A. Beith, chief electrician at Buckingham Palace, Windsor Castle, etc., has retired after forty-three years' service under the Office of Works.

We are pleased to learn that Mr. Victor Dale, who is now recuperating on the South Coast after a long and serious illness, will probably return to his duties with the E.D.A. in the early part of next week.

Mr. J. A. Forde, engineer and manager of the Isle of Thanet Electric Tramways and Lighting Co., Ltd., has been re-elected a member of the Broadstairs Urban Council, of which body he is the present chairman.

The Department of Overseas Trade has decided to establish a Trade Commissioner (Grade I) in the Irish Free State with headquarters at Dublin, and to appoint Mr. W. Peters to the new post.

The Ministry of Transport announces that Col. Sir John W. Pringle, chief inspecting officer of railways, will retire on May 23rd under the age limit, and that the Minister of Transport has appointed Lt.-Col. A. H. L. Mount, who has been employed as an inspecting officer of railways for the past nine years, to succeed him.

Sir James Devonshire, having reached the retiring age, has resigned the position of chairman and managing director of the North Metropolitan Electric Power Supply Company but retains his seat on the board. Lord Ashfield has been appointed chairman of the company and Sir James Devonshire deputy chairman.

From a list of 56 applicants for the post of tramways manager, Aberdeen Tramways Committee has drawn up a short list comprising Mr. John A. Baker, general manager, South Shields; Mr. G. A. Carr, assistant traffic superintendent, Newcastle; Mr. William M. Clark, engineer and manager, Nottingham; Mr. James L. Gunn, manager, Greenock and Port Glasgow Tramways Company; Mr. R. B. Herbert, operating superintendent, United Automobile Services, York; Mr. Hodgson H. Lancaster, traffic manager, Blackpool; Mr. Alfred Smith, chief clerk and accountant, Aberdeen; Mr. Charles Symon, outside assistant in charge of traffic department, Aberdeen. The salary is £750, rising to £900 by annual increments of £50.

Obituary.

MR. JOHN WILFRED LEWSLEY, on March 22nd, aged 50 years.

MR. CHARLES EDWIN BENHAM, on Monday, aged 68 years. He was the author of a book on Dr. Wm. Gilberd (or Gilbert), an electrical pioneer.

MR. THOMAS HENRY PLOWRIGHT, as the result of an accident through being knocked down by a runaway horse, aged 58 years. He had for 27 years been on the staff of the Windsor Electrical Installation Co. and was chief assistant engineer to Mr. A. E. Farrow, until the recent change of management.

IN PARLIAMENT.

Further Consideration of the London Traffic Bills of the "Underground" and L.C.C.

SIR John Gatti, L.C.C., in cross-examination, before the House of Commons Committee which is considering the London Traffic Bills of the Underground Group and London County Council, said the rights of Middlesex County Council in regard to their tramway system (at present leased to Metropolitan Electric Tramways, Ltd.) under the L.C.C. Bill were preserved just as they were before. The L.C.C. had just authorised the construction of 300 new tramcars. Their 1928-29 deficit of £43 000 would, in 1929-30, be turned into a surplus of over £40 000. He agreed with Lord Ashfield that if money was going to be raised on the strength of the common fund it must be a permanent institution, with any variations that might be necessary. The minimum period in which he contemplated that the agreements should be terminable was about forty years. He agreed that the proposed tramway board would not have absolute control of the tramways. Any dispute between the parties would be submitted to arbitration. The L.C.C. would, of course, be represented on the tramways board if it were set up.

The Chairman (Sir Henry Cautley) referring to the report of the Minister of Transport on the Bills, asked Mr. R. E. Hill, assistant secretary in the Financial and Statistical Department of the Ministry, what had influenced the Minister when he suggested that the subject of the reasonable return on ranking capital should be considered by a public inquiry if he thought fit.

Mr. Hill said he thought that it was generally recognised that this was a duty which the Bill would impose upon the Minister, and that it would involve matters of very considerable public importance. The reasonable return which was settled would have to be a factor in determining what the level of fares to be paid by the travelling public should be, and it would also be a factor in establishing the balance which would be available to the common fund for improving services, reducing fares, or for the other purposes set out in the Bill. Therefore his decision in this matter was going to react through the operation of the scheme. In view of that far-reaching effect, the Minister felt that it might be desirable that the views of the various public authorities who would have powers under the Bill to make representation to the Minister about fares and about services should also have the opportunity of expressing their views at a public inquiry on the question of the return on the ranking capital.

West Highland Water Power Bill.

The proceedings of the House of Lords Committee on the West Highland Water Power Bill were concluded on March 26th. Mr. F. J. Wrottesley, K.C., for the Investment and Estates Control, said the promoters were to deliver their electricity, after a journey of 120 miles, right on top of one of Scotland's coalfields in the Falmouth and Stirling districts, where cheap electricity could be produced.

Mr. Carmont, K.C. for certain landowners, described various Scottish estates which, he said, would be ruined by the scheme.

Mr. Graham Robertson, for the promoters, admitted that they had no definite market for the current, but said it was necessary to have the Bill passed before the Central Electricity Board would make a contract.

The Committee found the preamble of the Bill not proved.

Pacific Cable Board Bill.

This Bill, promoted by the Pacific Cable Board to protect the pension rights of the staff, was passed for second reading in the House of Commons on March 25th. Mr. A. M. Samuel, Financial Secretary to the Treasury, said the terms had been settled by the Communications Company. The partner Governments were parties to them, and until the Government received their reply it was not in his power to state those terms.

Railway Companies and Road Traffic.

In the House of Commons on March 26th, the Great Western Railway, London and North Eastern Railway, London, Midland and Scottish Railway, and Southern Railway Bills were read the third time.

Derbyshire and Nottinghamshire Bill.

On March 26th the Derbyshire and Nottinghamshire Electric Power Co.'s Bill was passed by the Unopposed Bills Committee of the House of Lords. Under this Bill the company is empowered to raise £400 000 additional capital and its borrowing powers are increased to £1 014 000.

LEGAL INTELLIGENCE.

Dispute Concerning Clutches for Electric Motors at Cold Roll Mills.

MR. Justice Talbot, in the King's Bench Division, on March 27th, concluded the hearing of a case which concerned the merits of certain friction clutches which were used in connection with electrically driven machinery at cold roll mills and other works in South Wales and other places.

The plaintiffs in the action were the Cooper Roller Bearings Co., Ltd., of King's Lynn, Norfolk, who sued the Power Plant Co., Ltd., of West Drayton, Middlesex, for £833 in respect of the price of goods sold and delivered and for work and labour done. The question in dispute was whether certain friction clutches supplied by the plaintiffs for use in connection with the machinery at rolling and other mills were in accordance with contract or not. Plaintiffs supplied the clutches at the order of the defendants and installed them, and they said they afterwards maintained the plant at the request of the defendants. It was for this maintenance work that they made their claim of £833.

The contention of the defendants was that the clutches supplied by the plaintiffs were unsuitable for the purpose for which they were required and that plaintiffs had committed breaches of contract and warranty. The defendants alleged that they had been put to considerable expense in consequence of the plaintiffs' breaches, and they counter-claimed £1 500 odd as damage for the expenses to which they had been put.

The main allegation of the defendants was that though they gave the plaintiffs all the information necessary, and for which they asked, so as to enable them to design and supply clutches which would be suitable for the duty they would be required to perform, the clutches actually supplied were in fact too small, and as a result a good deal of trouble was caused when the mills at which they were installed were being started up. The clutches overheated and the plates cracked and broke, and in many cases it was found very difficult to start up at all. The whole fault for this was, the defendants said, that of the plaintiffs, who designed inefficient clutches.

The reply of the plaintiffs was that, while admitting there had been a good deal of trouble at some works, it was entirely due to the lack of adequate electric power supply. The result of this was, it was said, that when attempts were made to start up, especially on Monday mornings, the clutches could not get the mills away without them being slipped for an abnormal length of time. This long period of slipping generated the heat which caused the plates to fail.

A considerable body of evidence was called on either side, and several electrical engineers dealt with the power question. Plaintiffs' witnesses concluded that there was a lack of power, and defendants' witnesses were equally confident that the power supply was ample.

At the conclusion of the case Mr. Justice Talbot reserved judgment.

Welding Patents.

The Court of Appeal, consisting of the Master of the Rolls and Lords Justices Lawrence and Russell, on March 12th, allowed the appeal of the India Rubber Gutta Percha Telegraph Works Co., Ltd., from the judgment of Mr. Justice Eve, in the Chancery Division (see THE ELECTRICIAN of August 10th, 1928), holding that they had infringed the letters patent of the plaintiff, the Rose Street Foundry and Engineering Co., Ltd., of Inverness, for a welding machine.

Lamp Patents Infringement.

An action by the British Thomson-Houston Co., Ltd., against Uneedus Electrical Service was before Mr. Justive Eve in the Chancery Division on March 8, on a motion by the plaintiffs for an injunction to restrain infringement of the plaintiffs' letters patent. Counsel said the defendants were W. R. Bradley and his son, who were partners in the business.

His lordship made the order and said defendant must pay the costs.

The G.E.C. 2nd XI association football team beat Oxford Circus in the third round of the West End Business Houses Junior Challenge Cup. Each of the first three G.E.C. teams are now semi-finalists in challenge cup competitions. Two netball teams have lost to Venesta and Mayfair respectively. G.E.C. succumbed to Park at badminton, but defeated Guaranty Trust. They, however, lost to L.N.E.R. at table tennis. The rowing teams indulging in good pulls to beyond Mortlake and back are fast getting into form.

LAMP PRICES.

Further Price Reductions of Gasfilled and Vacuum Type Standard Lamps.

THE Electric Lamp Manufacturers' Association has announced that prices of certain vacuum and gasfilled lamps have been reduced, including the following makes :— " Bell," " Cossor," " Cosmos," " Cryselco," " Royal Ediswan," " Elasta," " F," " Mazda," " Neron," " Orion," " Osram," " Philips," " Siemens," " Stearn," " Stella," " Tungsram," and " Z."

The new prices came into force on Tuesday, and details of the lamps affected are given below :—

These reductions constitute the sixth downward price movement in lamps since the close of the war.

MID-EAST ENGLAND ELECTRICITY.

Commissioners' Scheme Adopted by Central Electricity Board Without Serious Alteration.

THE Mid-East England Electricity Scheme, as submitted by the Electricity Commissioners to the Central Electricity Board, was given in detail in THE ELECTRICIAN of January 25th last. The scheme has now, with few amendments, been adopted by the Central Electricity Board.

The scheme, as originally submitted, allowed for eighteen stations to be chosen from the forty now existing to be " selected " stations, and in this connection, a total of sixteen such stations has been decided upon. The stations omitted from the approved list are Chesterfield (Chesterfield Corporation), and Keighley (Keighley Corporation), both of which stations appear under " Temporary Arrangements." The routes to be followed by the principal main and secondary main transmission lines are much the same as suggested by the Commissioners, while the area covered by the scheme is also the same.

The number of transforming stations for both principal and secondary lines remains the same, with the omission of Barton-on-Humber as a secondary line station.

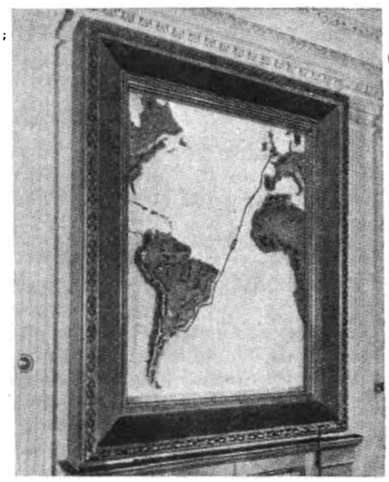
The additions and alterations to existing stations are not dealt with in the scheme as published by the Central Board, but the suggestions, as made by the Commissioners, were given in our issue of January 25th.

The cost of the scheme is estimated to be £4 616 750, of which £2 907 156 will be spent by the Central Board, on transmission lines and transforming stations, and £1 709 594 by owners of selected stations. The capital expenditure required to develop the area to the same extent by individual undertakings was stated by the Commissioners to be £5 406 584. The scheme allows for those cases in the area where non-standard frequencies are used, and since the alteration of these systems was not essential to the operation of the main scheme, such frequencies are permitted.

ELECTRIC CLOCKS.

Special Impulse Transmitters for Marine Use —An Interesting Progress Indicator.

A COMPREHENSIVE range of electric impulse clocks for marine use has been developed by GENT AND CO., LTD., of Faraday Works, Leicester. These clocks, known under the trade name of "Pul-syn-etic," differ from those designed for land use, in that the transmitter is operated by a balance wheel, instead of a pendulum, while a larger current than the 0·22 A usually employed is sent round the ship's clock circuit. The clock fittings are made more robust, when, as is generally the case, the system is driven by the ship's electricity supply mains—in such cases the current is standardised at 0·38A. The transmitter is generally fitted with an arrangement consisting of an operating key-lever and a dial, engraved with minutes, by which all the ship's clocks can be automatically advanced or retarded as the ship sails east or west into a different meridian. The transmitting apparatus consists of a half-minute impulse mechanism, together with automatic advance and retard apparatus all mounted within a cabinet, and provided with 9 in. " pilot " dial to show the time indicated by the ship's impulse clocks. The half minute impulse mechanism is mounted on a cast iron base, upon which is also assembled a jewelled lever escapement with chronometer balance. For advancing the clocks when sailing eastward, the automatic self-controlling contact is employed. This contact is controlled by a fly-action which allows it to " make " approximately once per second instead of the more normal half minute.



The apparatus, by Gent and Co., which indicates the progress made of a ship at sea.

To advance the ship's time, say, 35 minutes, the pointer on the setting dial is turned to figure 35. The " advance " lever is then depressed, and 70 contacts are automatically made by the transmitter, one for each half minute, and the pilot dial and the impulse clocks are thus set to the required time. To retard the clocks, it is necessary to set the pointer to the desired number of minutes and press the " retard lever," and the impulse clocks remain " held " until the desired number of minutes have elapsed, when the pilot dial and the electric impulse clocks throughout the ship automatically re-start.

The " retard " mechanism brings in a resistance, when operated, equal to that of the impulse clock circuit of the vessel.

Gent and Co. also manufacture an automatic ship's progress and position indicator, which, made in the form of a large coloured relief map in ornamental frame, is generally fixed in the main entrance to the 1st class saloon. The map covers the recognised route that the vessel is in the habit of taking, and, in the illustration above, both hemispheres are covered by a ship sailing from England to Buenos Aires, touching at various ports of call. A model ship, representing the liner, is moved along the route by concealed electric clockwork operated by the time system of the ship, and the rate of travel of the model is arranged proportionate to the actual speed of the vessel, so that its position on the ocean may be seen by the passengers at any time, and the vessel's progress noted day by day. Lighting effects, in the form of rising and falling coloured lights, are provided to illuminate and to give " life " to the relief map. The lights simulate sun-rise and sun-set effect on the model and across the hills, and cast shadows in the valleys. By means of a switch moved at the commencement of the return journey, the model automatically reverses and indicates the return journey.

Obviously the progress indicator is only suitable for liners passing over a special route.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, April 5th.—Supply and erection of three single-phase, 4 000 kVA transformers, to form a 12 000 kVA three-phase bank, at the Authority's West Bromwich generating station. Specification, etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

BIRMINGHAM CORPORATION, April 6th.—Manufacture and supply of 1 000 tons of tramway rails, with fishplates. Specifications, etc., from Mr. A. C. Baker, Council House, Birmingham.

33 000 V Switchgear.

MANCHESTER CORPORATION, April 8th.—Supply and erection of two 33 000 V metal clad switch units. Specification (No. 234) from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit, £1 1s.

WESTHOUGHTON URBAN DISTRICT COUNCIL, April 8th.—One year's supply of stores, including metallic filament lamps, etc. Forms of tender, etc., from the Surveyor.

GREAT WESTERN RAILWAY, April 9th.—Supply of electrical wires and cables (list 20), telegraph ironwork (list 21), and wire-iron and steel for telegraph work, etc. (list 28). Forms of tender can be obtained from the Stores Superintendent, Swindon.

ALDERLEY EDGE AND WILMSLOW ELECTRICITY BOARD, April 10th.—(1) Two transformer kiosks and switchgear (specification A.W.1); (2) e.h.t. and l.t. cables (A.W.2); (3) swtichgear and transformers (A.W.3). Specifications, etc., from Mr. A. J. Robertson, 20, Brazennose Street, Manchester; deposit £2 2s. for each.

DUNDEE CORPORATION, April 10th.—Supply of d.c. and a.c. house service meters and 30 000 pairs of 8 mm. by 15 in. arc lamp carbons for use in Angold magazine flame arc lamps. Specification, etc., from the General Manager and Engineer, Electricity Supply Department, Dudhope Crescent Road, Dundee.

HULL CORPORATION, April 10th.—Electric light and bell installation, at Maternity Home and Infants' Hospital, Hedon Road, Hull. Plans, etc., from the City Architect, Guildhall, Hull; deposit £2 2s.

MIDDLESBROUGH CORPORATION, April 10th.—Twelve months' supply of cables and meters. Specifications, etc., from Mr. R. H. Scotson, borough electrical engineer, Snowdon Road, Middlesbrough.

STOKE-ON-TRENT CORPORATION, April 10th.—Supply and erection of e.h.t. and l.t. overhead transmission lines. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

STOKE-ON-TRENT CORPORATION, April 12th.—Supply and erection of 22/24 H.P. heavy oil engine at Stallington Hall, near Stoke-on-Trent (contract 2 915). Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

PRESTWICH URBAN DISTRICT COUNCIL, April 13th.—Supply of electric lamps, etc. Form of tender from the Surveyor, Town Hall, Prestwich, Lancs.

BATLEY CORPORATION, April 15th.—Supply of l.t. cable. Forms of tender from the Borough Electrical Engineer, Electricity Works, Batley.

BRIDPORT CORPORATION, April 15th.—Complete installation of three-phase cables, h. and l.t. underground and overhead sub-stations, street lighting and services. Specification, etc., from the Town Clerk; deposit £2 2s.

SUDBURY CORPORATION, April 15th.—Supply of electric fittings, etc., for one year. Forms of tender from the Borough Surveyor, Town Hall, Sudbury, Suffolk.

CENTRAL ELECTRICITY BOARD, April 15th.—Supply and erection of 33 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-S.L.2) from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

BIRKENHEAD CORPORATION, April 16th.—Twelve months' supply of stores to the electricity generating station, including house service and mains boxes, insulating tapes, electrical engineering sundries, etc. Specification, etc., from Mr. F. E. Spencer, borough electrical engineer, Craven Street, Birkenhead.

DUMFRIES CORPORATION, April 17th.—Supply and erection of one water cooling tower, for the Electricity Department. Specification, etc., from Mr. W. S. Johnston, engineer and manager, Electricity works, Leafield Road, Dumfries; deposit, £1 1s.

LEEDS GUARDIANS, April 17th.—Supply and erection of steam driven generating sets, boiler feed pumps, etc.; and supply and erection of switchboard and mains, at the Institution, Rothwell, near Leeds. Specifications, etc., from Mr. E. Griffiths, 44d, The Temple, Dale Street, Liverpool, until April 9th.

WEST RIDING EDUCATION COMMITTEE, April 17th.—Electric light installation at Edlinton New Middle and Elementary Schools and caretaker's house. Specifications, etc., until April 10th, from the Education Officer, County Hall, Wakefield.

BIRMINGHAM GUARDIANS, April 18th.—Installation of call lighting system, at Dudley Road Hospital, Birmingham. Conditions, etc., may be seen at the Union Offices, Edmund Street, Birmingham.

CENTRAL ELECTRICITY BOARD, April 22nd.—Supply and erection of 33 000 V and lower voltage transformers. Specification (No. N.W.E.-S.T.2) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

DUNDEE CORPORATION, April 24th.—One year's supply of stores to transport department, including armature and field coils, carbon brushes, etc. Specifications from Mr. D. P. Morrison, Transport Office, Dundee.

DUNDEE HARBOUR TRUSTEES, April 27th.—Supply and erection of two 3-ton electric travelling jibs, portal cranes at King George V. Wharf, Dundee Harbour. Specifications, etc., from the General Manager and Engineer, Harbour Chambers, Dundee.

CENTRAL ELECTRICITY BOARD, April 29th.—Supply and erection of electricity meters, in connection with the Central) Scotland Electricity Scheme. Specification (No. C.S.-S.S. 141 and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

SOUTHAMPTON CORPORATION, April 30th.—(1) Steel-framed building, platform for fans, overhead bunkers, etc.; (2) two water-tube boilers with superheaters, economisers, stokers, fans, soot blowers, etc.; (3) steam, feed water and other piping etc.; and (4) water softener, at Electricity Works, Western Esplanade, Southampton. Specification, etc., from Mr. W. G. Turner, borough electrical engineer; deposit, £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(a) Main 33 000 V switchgear, each circuit-breaker having rupturing capacity of not less than 1 500 000 kVA; (b) auxiliary 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 500 000 kVA, with group feeder reactors, for Ironbridge power station. Specification (No. 4) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(1) One 50 000 kW turbo-alternator, with step-up transformers, etc.; (2) condensing plant, boiler-feed pumps, evaporators, etc.; (3) circulating water pumps, etc., for Ironbridge power station. Specifications (No. 2) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

INDIA STORE DEPARTMENT, April 5th.—Hospital steam laundry equipment, with Lancashire boiler, electric motors, piping, etc. Form of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

SOUTH INDIAN RAILWAY CO., LTD., April 5th.—Supply

Digitized by Google

of electrical materials and fittings. Specifications, etc. (5s.), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

VICTORIAN RAILWAY COMMISSION, April 5th.—Supply of rectifiers and storage batteries, for power signalling purposes (contract No. 42 549). (Reference B.X. 5 166.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission lines towers (specification 29/13). (Reference A.X. 7 401.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Supply of 22 000 V transformers (specification No. 29/17). (Reference B.X. 5 101.)

DUBLIN BOROUGH COMMISSIONERS, April 9th.—Supply and erection of electrically-driven pumping plant on site adjacent to service reservoir at Stillorgan, co. Dublin. Specification, etc., from the City Treasurer; deposit £1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 21). (Reference B.X. 5 018.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 15th.—Conductor cords (No. P. and T., 151/1 319). (Reference B.X. 5 098.)

INDIAN STORES DEPARTMENT, April 16th (extension of time).—Supply of 30 kW steam engine driven generator set (order No. N. 9 538). (Reference B.X. 5 167.)

INDIAN STORES DEPARTMENT, April 16th.—Supply and erection of one 5-ton overhead electric three-motor gantry crane (order No. N. 9 536). (Reference A.X. 7 652.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 17th.—Supply of copper earthplates (specification 133). (Reference A.X. 7 556.)

UMTALI MUNICIPALITY, April 18th.—Supply of line sundries switchgear and transformers, in connection with extensions of electricity undertaking. (Reference B.X. 5 142.)

UMTALI MUNICIPALITY, April 18th.—Supply of 1 000 kW turbo-alternators, spray cooling plant, switchgear and crane (contract B). (Reference B.X. 5 145.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, April 22nd.—Supply of electric hanging and ordinary lamps. (Reference B.X. 5 188.)

DUBLIN PORT AND DOCKS BOARD, April 23rd.—Supply and erection of three electric, overhead, travelling cranes and gantries, at new tobacco warehouse, Custom House Docks, Dublin. Specification, etc., from the Engineer, East Wall, Dublin.

PORT ELIZABETH MUNICIPALITY, April 25th.—Supply and erection of 22 000 V switchgear, h.t. and l.t. switchboards (specification No. 20). (Reference B.X. 5 194.)

PORT ELIZABETH MUNICIPALITY, April 25th.—Supply of 200 kVA transformer, earth resistance and various lamps (specification No. 22). (Reference B.X. 5 195.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, April 25th.—Supply of three electrically-driven wheel lathes (tender No. 1 410). (Reference A.X. 7 621.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

CAPETOWN MUNICIPALITY, May 1st.—Supply of 30 ft. steel poles, cross-arms, insulators, fly fuses, etc. (specification 459/1929). (Reference A.X. 7 697.)

Cables and Accessories.

STATE ELECTRICITY WORKS, MONTEVIDEO, May 6th.—Supply of electric cables and accessories. (Reference B.X. 5 178.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, May 15th.—Supply and erection at Government Printing Office, Cairo, of 120 kW d.c. Diesel electric generating set, with foundations, artesian well, electrically-driven water cooling pump, etc. Forms of tender, etc. (10s. 6d.), from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

VICTORIAN RAILWAY COMMISSION, May 15th.—Supply of one geared three-phase electric winding engine (contract No. C.M. 778). (Reference A.X. 760.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, May 16th.—Supply and installation of electric signalling apparatus at Johannesburg. (Reference B.X. 5 165.)

BLOEMFONTEIN MUNICIPALITY, May 18th.—Supply and erection of (*a*) turbine and generator, condensing plant and auxiliaries and switchgear and cables; (*b*) cooling spray pond equipment, or cooling tower (contract No. 1). (Reference B.X. 5 192.)

PLOVDIFF (BULGARIA) PROVINCIAL COUNCIL, May 20th.—Supply of two Francis turbines, two 5 000 kVA generators, two 5 000 kVA, two 1 000 kVA and two 150 kVA transformers, for Votscha-Kricim power station.

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

TYNEMOUTH CORPORATION.—Macintosh Cable Co., Ltd., supply of cables for 12 months.

GLOSSOP CORPORATION.—Urban Electric Supply Co., Ltd., wiring Hadfield Library for lighting.

FYLDE GUARDIANS.—P. J. Frampton, electric light wiring and fitting of the Institution, £2 239.

MAIDENHEAD CORPORATION.—W. Lucy and Co., provision of kiosk for Punt Hill sub-station, £244.

GLASGOW CORPORATION.—E. Allen and Co., Ltd., manganese steel rails; British Insulated Cables, Ltd., 28 in. copper bends.

ADMIRALTY.—Edison Swan Electric Co., Ltd., operating keys and key combinations, accumulators and cells, and terminal and bearing blocks.

SPENBOROUGH URBAN DISTRICT COUNCIL.—Butler and Horn, electric light installation in 40 houses, £303; Hepworth and England, 96 houses, £706 16s.

UXBRIDGE URBAN DISTRICT COUNCIL.—Watford Electric Manufacturing Co., automatic starter, contactor and relay instrument, for fire siren, £34 5s. (Recommended.)

BERMONDSEY (LONDON) BOROUGH COUNCIL.—Standard Telephones and Cables, Ltd., provision of loud-speaker apparatus at central baths, £52 4s. (Recommended.)

HORNSEY CORPORATION.—Doulton and Co., Ltd., troughs and bridges, and Standard Telephones and Cables, Ltd., and Pirelli-General Cable Works, Ltd., cables. (Recommended for renewal for 12 months.)

LONDON COUNTY COUNCIL.—Clarke, Chapman and Co., Ltd., three boilers, £77 950; John Spencer, Ltd., pipework, £8 418 10s.; J. P. Hall and Sons, Ltd., feed pump, £651 10s., for Greenwich power station.

ILFORD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of two switch pillars, for Gants Hill sub-station, £605; Crompton, Parkinson, Ltd., supply of transformer and switch kiosk, £497 10s. (Both recommended.)

ROTTERDAM MUNICIPALITY.—British Thomson-Houston Co., Ltd., supply of 25 000 V, three-phase, 50 cycle switchgear. The contract includes 39 B.T.H. isolated phase equipments with oil circuit breakers having interrupting capacity of 1 500 000 kVA. See page 428.

SOUTHEND CORPORATION.—Richard Garrett and Sons, three double-deck trackless vehicles, £1 969 5s. each; British Mannesman Tube Co., Ltd., 50 medium poles, £9 2s. 6d.; Union Cable Co., Ltd., two miles of overhead trolley wire, 1s. 1d. per lb. (subject to market fluctuations).

WIMBLEDON CORPORATION.—Sub-station transformers: Foster Engineering Co., Ltd., eight 200 kVA (indoor), £840; Hackbridge Electric Construction Co., Ltd., nine 200 kVA (indoor), £945; two 200 kVA (outdoor), £240; one 100 kVA (outdoor), £86; Johnson and Phillips, Ltd., five 1 000 kVA (outdoor), £1 755.

LIVERPOOL CORPORATION.—Cargo Fleet Iron Co., Ltd. 1 800 tons Sandberg tram rails, £11 per ton; Cammell, Laird and Co., Ltd., 100 tons steel fishplates, £12 10s. per ton; Soc. Anon. des Usines et Acieries Allard, 20 tons of mild steel fishbolts, £12 per ton and 90 tons of steel tie-bars, £11 9s. per ton. (All recommended.) Rowe Bros. and Co., Ltd., St. Helens Cable and Rubber Co., Ltd., General Electric Co., Ltd., Baxendale and Co., Ltd., and Perrin Hughes and Co., Ltd., electric fittings. (All recommended.)

STEPNEY (LONDON) BOROUGH COUNCIL.—W. T. Henley's Telegraph Works Co., Ltd., supply of cables for two years, £18 192 7s. 3d. Also tendered: Hackbridge Cable Co., Ltd., £18 293 4s. 4d.; Macintosh Cable Co., Ltd., £18 433 8s. 4d.; W. T. Glover and Co., Ltd., £18 750 9s.; Siemens Bros. and Co., Ltd., £18 802 15s. 11d.; Pirelli-General Cable Works, Ltd., £18 829 18s. 9d.; British Insulated Cables, Ltd., £18 844 16s. 5d.; Standard Telephones and Cables, Ltd., £18 931 16s. 7d.; Callender's Cable and Construction Co., Ltd., £18 977 18s. 3d.

ELECTRICITY SUPPLY.

Bolton and Assisted Wiring—Proposed Extensions at Brighton—Croydon and the Central Board—Plant Replacement at Coventry—New Mains and Feeders for York—Further Extensions at Portsmouth—Tynemouth, Assisted Wiring, and Contractors.

STEVENTON, Berks, P.C. is asking for electricity to be brought to the village.

Maidenhead T.C. has applied for a loan of £3 800 for a sub-station in Bridge Road.

Portsmouth Electricity Committee is to extend extra h.t. mains at a cost of £9 500.

Bexhill Electricity Committee recommends cable and plant extensions at a cost of £1 647.

Bampton (Oxfordshire) P.C. is to discuss the possibility of using electricity for street lighting.

Coventry Electricity Committee seeks sanction for a loan of £16 635 for the replacement of plant.

The Commissioners have made an Order for the supply of electricity to Pleasington by Blackburn Corporation.

The Thames Valley Electricity Supply Co. has obtained a contract for street lighting at Henley, to supersede gas lighting.

Eynsham P.C. has asked the Wessex Electricity Co. for a tender for street lighting, which it is proposed to inaugurate next winter.

Cheltenham Electricity Committee has asked the Borough Engineer to prepare plans for the erection of a sub-station on the Promenade.

Brighton Lighting Committee has authorised mains extensions at a cost of £1 185, for the supply of electricity to the Bevendean Valley housing estate.

Oundle U.D.C., after discussing the question of a supply of electricity for the town, has referred the matter to the Highways Committee for consideration.

The Chiswick Electricity Supply Corporation, Ltd., proposes to lay a new cable to the works of Whitbread and Co., Brentford, and to erect a new feeder pillar in Essex Square.

Aylesbury has received sanction to the following loans for prospective expenditure: Mains and services, £24 271; sub-station equipment, £699; and domestic apparatus for hire, £9 412.

York Corporation has voted the following estimates:—Boiler plant for generating station, £5 400; h.t. mains, feeders, etc., £35 747; mains and services, £30 000 and Linton Lock station, £1 000.

Guildford Electricity Committee is to extend mains, at a cost of £1 719, to supply the Longdown Road and Warren Road districts.—Mains are to be extended, at a cost of £1 658, to supply the Worplesdon Road district.

Chelmsford Corporation is to apply to the Electricity Commissioners for an inquiry to be held with a view to obtaining a reduction in the price, at present charged, for electricity for lighting and power, and to make representations to the alleged inadequate supply of electricity in the borough.

Morecambe Electricity Committee is to make representations to Lancaster Corporation with a view to the White Lunn estate and a surrounding area within the parish of Heaton-with-Oxcliffe being excluded from its application to the Electricity Commissioners for a Special Order to increase its area of supply.

Southend T.C. has adopted a scheme prepared by the Electrical Engineer providing for h.t. ring mains to permit of a.c. distribution in the North Eastern, North Western and Western areas of the borough. The scheme comprises the laying of 11 000 V mains, with transformers, kiosks, and section boxes, and the estimated cost is £48 516.

Droxford R.D.C. has decided to oppose an application by the West Hampshire Electricity Co. for an Order to supply electricity in the rural area, on the ground that the Committee has not made sufficient provision for covering the district, and that the price of 10d. per kWh is exorbitant. Portsmouth Corporation has already offered to supply Hambledon, and the Rural Council has consented to this proposal, and has invited the Corporation to include Soberton.

Bolton Electricity Committee has received a report of the Borough Electrical Engineer upon a suggested assisted wiring scheme, and it has been referred to a sub-committee.—The Borough Electrical Engineer having reported that the open cellular type e.h.t. switchgear at Spa Road sub-station has become obsolete, and requires renewing, it has been decided that such switchgear be replaced during the forthcoming summer season by switchgear of larger capacity and modern type.

Stoke-on-Trent Electricity Committee reports that considerable economies have been shown in generation at the central power house during the winter, and congratulates the Engineer and his staff thereon. Coal used per kWh generated was 1·762 lb., against 2·063 lb. in the previous winter; works costs were 0·308d. per kWh, against 0·388d.; maximum load was 12 952 kW, against 10 354, and output was 4 401 501kWh, against 3 292 192.—The Committee has accepted a tender amounting to £619 for the erection of a sub-station at Sneyd Hill.

Brighton Lighting Committee is to make application to the Electricity Commissioners for sanction to borrow £10 000 for h.t. and l.t. overhead mains, buildings, switchgear, etc., in connection with the proposed sub-station at Warren Farm schools.—The Committee seeks sanction to borrow £50 000 for extensions of mains and house services, and £15 000 for cable connections in relation to the extension of the buildings and plant at Southwick works.—Sanction to borrow £9 317 for the lighting of London Road, Dyke Road, and Lewis Road has been received.

Tynemouth Electricity Department has been asked to submit terms for a supply of current for the New Cinema to be erected near the railway station.—The Electrical Engineer reports that arrangements have been made that for future orders for assisted wiring the contractors must supply lamps to consumers, without extra charge, two of which (one for living room and one for kitchen) must be E.L.M.A. lamps and others of a make approved by the Electrical Engineer.—The Electricity Committee is negotiating for a site for a sub-station on the Ingleside estate.

At Cape Town the street lamps are not lit during moonlight nights. The Electricity Committee now recommends that the lighting of all street lamps in the city be maintained during moonlight nights. To do this will entail an extra cost, in lamp renewals and coal consumed, of approximately £400 per annum. The Committee recommends that the Electrical Engineer be granted three months' vacation leave as from June 7th next, and that thereafter he proceed on service overseas for a visit to America and to attend the World Engineering Conference in Tokio in October and November.—The Committee recommends the acceptance of a tender amounting to £815 for the erection of a sub-station at Wynberg.

Plymouth Committee has adopted a scheme for the hire purchase of radiators on the terms and conditions now in operation in respect of electric cookers, but, for the present, the scheme is to apply only to hotels and boarding houses. It has also been resolved to vary the terms of payment for electrical installations for domestic purposes on the quarterly system spread over seven years, so that if consumers pay for their installations outright after the first year they will be allowed a reduction of 20% on the balance, after the second year's payment 15%, after the third year's payment 10%, or after the fourth year's payment 5%.—The Electricity Committee estimates an expenditure for the year of £155 000 on mains and plant.

The Chairman of the Croydon Electricity Committee and the Borough Electrical Engineer have had an interview with one of the chief officers of the Central Electricity Board and obtained a promise that within two months the Board will either undertake to give the supply required by the Corporation from the grid in the winter 1930-1 or sanction an immediate extension of the Corporation's generating plant. The Engineer reports that to meet the demand on the station for the coming winter, it is necessary to provide further cooling towers equal to three of the existing towers. In the event of the station being extended either in 1930-1, or at a later date, it would be necessary to provide additional towers equivalent to fourteen of the existing towers. The Engineer states that a new type of tower built of ferro-concrete, of which he had had favourable reports, is now being built at some stations, one of these concrete towers doing the work of three or four wooden towers, and having at least double the life of a wooden tower. The Committee recommends obtaining alternative tenders for three wooden towers and one concrete tower, and will, when the tenders have been obtained, further consider the question and report to the Council as to which type should be adopted.

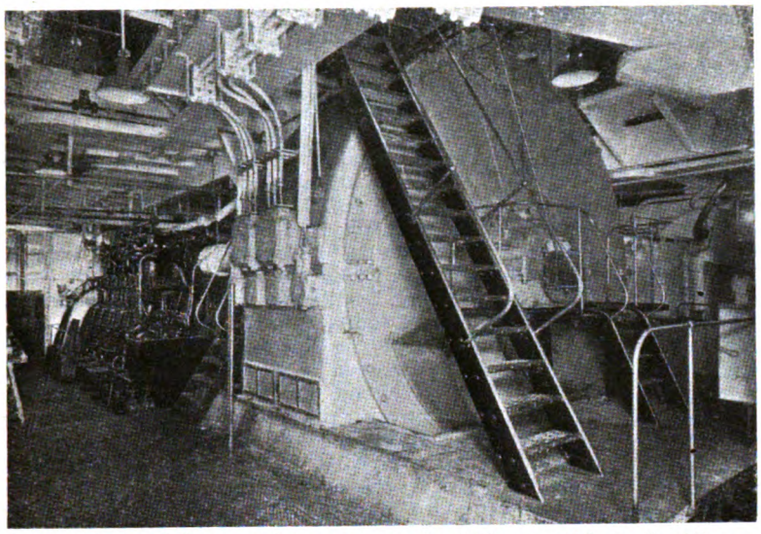
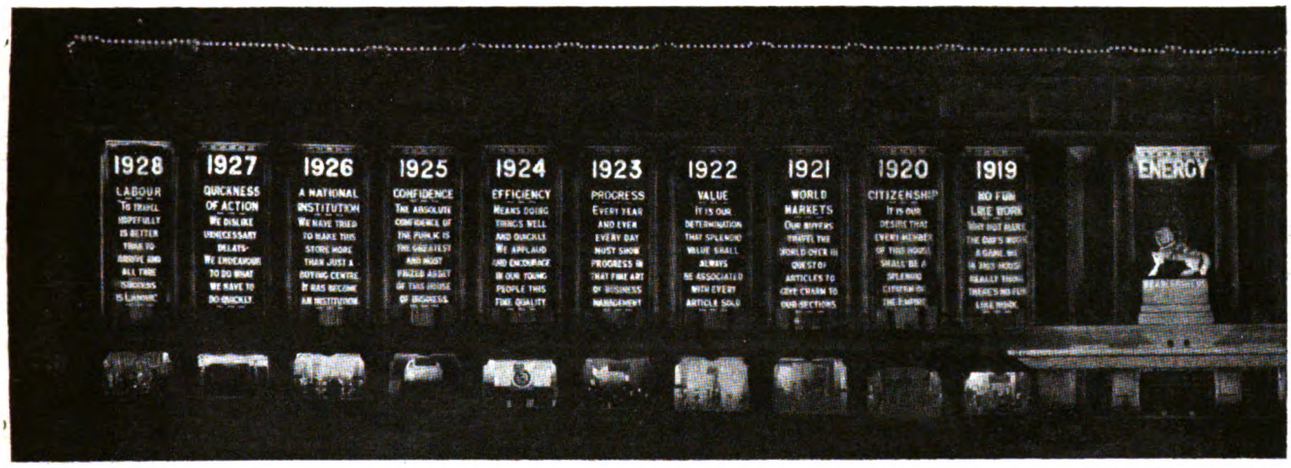
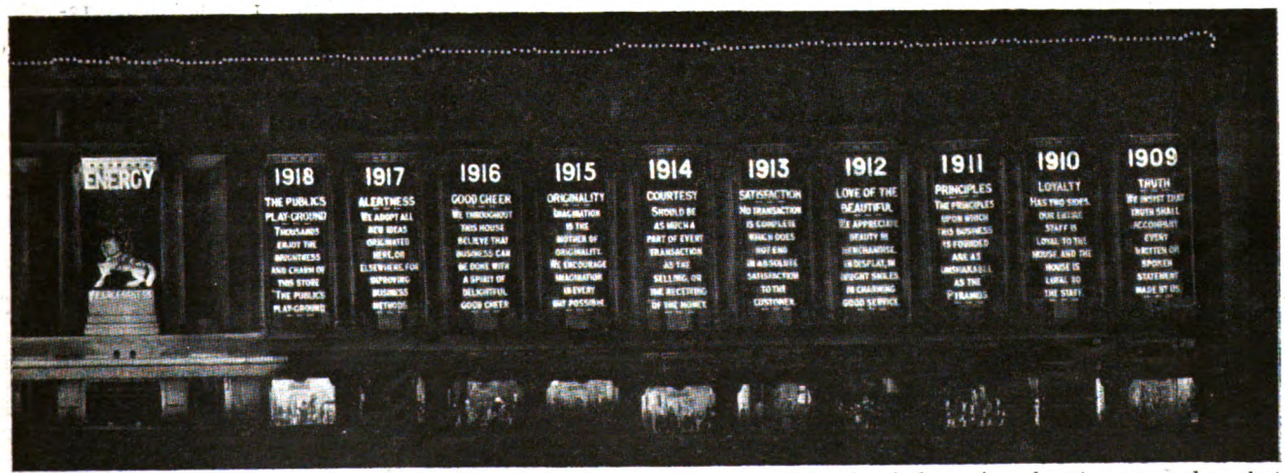
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



A view of one of the propellor motors on the "Viceroy of India," with one of the Diesel engine-driven auxiliary d.c. generators in the background. The installation of this turbo-electric vessel was constructed and erected by the British Thomson-Houston Co., Ltd., and her performance during trials was described at length in our issue of February 22nd, by a representative of THE ELECTRICIAN, who was on board. The vessel is now well on her way to India, having sailed on her maiden voyage on March 28th.

Mr. J. C. Denison-Pender, who, as announced in THE ELECTRICIAN last week, has been elected chairman of the Eastern Telegraph Co., the Eastern Extension, Australasia and China Telegraph Co., and the Western Telegraph Co.





The decorating of buildings with electrical illuminations on occasions for celebration is becoming almost commonplace, but rarely have we seen so good a display as that shown at Selfridges, London, during "Birthday Week." The decorations at this store during its anniversary week have become an annual event, and though in previous years the illuminations have been excellent, never before have they approached so spectacular a display as was the case this year. The illuminations, of which the above are pictures, stretched across the whole front of the building, the length of which has necessitated our reproducing the photograph in two sections. That on the top shows the left hand portion, while that below shows the right; the mounted figure appearing in both illustrations was a centrepiece. Each letter contained on the average 12 lamps, and each message consisted of nine lines. On the Oxford Street front there were 21 bays, while in Duke Street there were two, with one in Orchard Street.

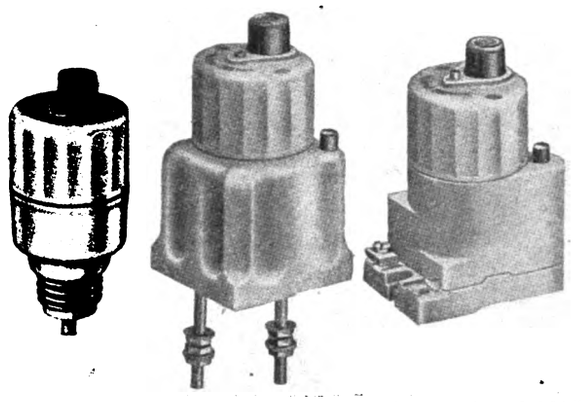
A NEW CIRCUIT BREAKER.

WE have received from the A.E.G. ELECTRIC CO., LTD., 131, Victoria Street, London, S.W.1, particulars of the new "Elfa" automatic circuit breaker. This device has been designed to protect circuits of all current ratings, without interruption so long as the duration of the overload is not such as



The three types of "Elfa" cut-out: left, the screw type; centre and right the switchboard and built-in types respectively.

to injure the circuit, as, for instance, peak loads of short duration. The makers also claim the unit avoids the necessity of employing an extra set of fuses in motor circuits, for starting purposes. It is also useful for locating faults. The device is constructed with two independently acting components which release the cut-out by magnetic release, and thermal release. A current flowing in the magnetic coil develops a magnetic flux, which flows through the divided iron core. The lower part of the core is movable and is attracted by the upper fixed part, towards which it is drawn if the magnetic pulling force exerted by the current flowing in the coil is greater than the pull of the adjustable spring. The thermal release consists of a bow comprising two strips of nickel steel alloy of different composition, which are hot-rolled together. On sufficient current flowing through this bow, the change of shape arising in consequence of the unequal expansion trips the cut-out. The forces arising out of these two methods of release act on a double lever locked by a pawl with the contact bridge. After the pawl has disengaged, the current circuit is broken, since the contact bridge is raised from the contacts by a spring. The magnetic release consists of a coil enclosing a two-part core, the upper part of which is stationary and fixed to the coil support and the lower part movable. The movable part of the core is held by an adjustable spring acting in the opposite sense to the magnetic pull. The mechanical pull of the spring is not overcome by the magnetic pull, until a current of six to eight times the rated current of the automatic cut-out flows through the coil. The thermal release is shaped like a bent pen-nib and its temperature is maintained at the same value with cut-outs for different ratings by altering the cross-section. The nickel steel of the thermostat is known as bimetal. The contacts, across which occurs the arc on the interruption of the circuit carrying an overload or short circuit, are bridged in the on position by a rigid contact piece separated from the parts of the switching mechanism by fire-proof insulation. This insulation also prevents the two springs provided from becoming over heated. One spring effects the breaking of contact, whilst the other exerts the contact pressure in the on position. If it is desired to trip the cut-out by hand a push button is arranged at one side of the unit. The cut-out is made in three types, namely, screw type, switchboard type, and button type. The first of these is manufactured for d.c. of 250 V. and a.c. of 380 V and for current strengths of 1, 1·5, 2, 2·5, 3, 3·5, 4, 5, 6, 7, 8, 9, 10, 12·5, and 15 A. The switchboard type with back-of-board connections is illustrated above, and dimensions of this cut-out are chosen so that the base and arrangement correspond to the standard 25 A switchboard fuse. Mounted fuses can be replaced by Elfa switchboard cut-outs where desired. In the built-in type in order to diminish the space requirement, the width of the base is made the same as the E 16 wall type fuse. Switchboard and built-in cut-outs are manufactured for a.c. up to 380 V to have the same current ratings as the type screw cut-outs, while the inner construction of all three is for the most part the same.

SWITCHGEAR FOR HOLLAND.

Large Dutch Contract Awarded to British Thomson-Houston Co., Ltd.

A CONTRACT has been awarded to the BRITISH THOMSON-HOUSTON CO., LTD., Rugby, by the Municipal Council of Rotterdam for 25 000 V three-phase, 50 cycle switchgear required in connection with the new power station three miles nearer the mouth of the Maas than the existing Schiehaven power station, which has reached maximum capacity. This switchgear contract is for 39 isolated phase equipments incorporating oil circuit breakers having an interrupting capacity of 1 500 000 kVA. The ultimate capacity of the station is to be 252 000 kW and the switchgear will be so arranged that the equipment for each phase is housed in a separate gas-proof building. Duplicate busbars are provided, these being divided into three sections which are inter-connected by reactors to a star busbar, and, by the provision of feeder series reactors, the magnitude of faults external to the station is limited, while, by reason of the isolated phase principle, the possibility of faults between phases in the switch-house is reduced. The oil circuit breakers have explosion chamber contacts and a pressure diaphragm in the top cover to relieve gas pressure in the event of sustained arcing taking place. As this diaphragm is piped to a gravel catch pit in the basement the oil fire risk is considerably reduced. Rotating blade busbar selectors are provided, these being remote mechanically operated from a passage way external to the switch-house, and as the inter-phase operating rods for both the isolating switch mechanism and oil circuit breaker mechanism are fitted with stuffing boxes where they pass through the phase dividing walls, the escape of hot gases from one phase compartment to another is prevented. All current transformers are of the bushing type, being fitted with oil circuit breaker terminal bushings, and the voltage transformers are of the single-phase type fitted with internally mounted limiting resistance and protective fuse.

The receipt of this order is particularly interesting as it follows closely on the order for two 42 000 kW turbo-alternators secured by another British firm, the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester. In this case the turbines are provided with "Metrovick" central flow condensers and the steam conditions are 25 atmospheres at 400° C. Each set is rated 42 000 kW maximum continuous, three-phase, 50 cycles, 5 500/5 800 V, 87·5% power factor.

FREQUENCY GRAMOPHONE RECORDS.

Interesting Recordings for Use in Electrical Laboratories—Checking Constancy of Motor Speeds.

IN the electrical experimental department of the Gramophone Co., at Hayes, "His Master's Voice" constant frequency records have been specially cut and calibrated so as to produce a series of pure tones ranging over about 8½ octaves on the musical scale. The set consists of 15 double-sided 12-inch red label records, giving 100 different frequencies of 50 seconds' duration each. The waves are sinusoidal in form, and provided that the turntable runs exactly 78 revolutions per minute, the frequencies are correct to within 1% of those stated upon the labels, so that they form an excellent source of alternating oscillations over a wide range. The frequencies range from 25·5 to 8 460 cycles. The double amplitudes in inches and the maximum velocities of needle point in a direction perpendicular to the normal line of groove in inches per second have been calibrated, and are printed upon the labels. These records have been cut so as to produce a substantially constant output of a.c. energy from 250 cycles upwards, whilst below 250 cycles there is a gradual decrease of energy. The exact amount of energy has been calibrated, and is given on the labels in the form of transmission units above or below the energy of the 993 cycle note, the transmission unit or T.U. being a well-known standard of measurement in telephony practice. These records will be found to be useful for experimental laboratories. If used with an electrical pick-up and amplifier they give electrical alternating currents of good wave form and known frequency, and the generated power may easily be measured, so that various pick-ups, amplifiers, loud speakers, or other telephone and wireless apparatus, may be calibrated under normal conditions. For ordinary laboratory and experimental tests these records form a substitute for an electrical oscillation generator and, in addition, will form a means of checking the speed of rotating apparatus.

WIRELESS NOTES.

Increasing Membership of the Radio Manufacturers' Association.

IT will be remembered that at the time of the annual meeting of the Radio Manufacturers' Association last December, the total membership had reached 100. The total now stands at 120, the new members being the Ashley Wireless Telephone Co. (1925), Ltd., Liverpool; Burgoyne Wireless, Ltd., London; Colvern, Ltd., Romford; Messrs. C. S. Dunham, London; the Europhone Radio Co., Birmingham; Gilophone, Ltd., Manchester; Gramo-Radio, Ltd., Church, Lancs; Messrs. Holt and Crompton, London; Messrs. Jackson Bros., London; O. and S. Oilless Bearing Co., Ltd., London; Perfectavox, Ltd., Yeadon, near Leeds; Phantestra (Renn's Gramophone and Wireless), Ltd., London; Philipson and Co., Ltd., Bolton; Radielle Co., Ltd., London; Reproduction, Ltd., London; the Standard Wet Battery Co., Ltd., London; the Tulsemere Manufacturing Co., Ltd., London; Ultra Electric, Ltd., London; Universal Gramophone and Radio, Ltd., London; and the Westinghouse Brake and Saxby Signal Co., Ltd., London.

A novel loud speaker has found its way to the market under the trade name of "Radioshade." This instrument is made by BROADCASTING LAMPSHADES, LTD., of 9, Alfred Place, Tottenham Court Road, London, W.1, and consists, as the name implies, of a standard lamp shade, with a loud speaker unit fitted below that portion of the shade which when in use appears immediately above the lamp. The unit is fitted with a cone, the whole being enclosed within the lamp shade. The device can be used with any standard lighting fitting of the table or floor type, and a number of designs and colourings are available. The operation of the lighting circuit is, of course, independent of the loud speaker.

The increasing sales of portable wireless receivers have encouraged the GENERAL ELECTRIC CO., LTD., to introduce a new screen-grid four-valve model for both long and short wave lengths. This takes the conventional style, being made in two sections for housing the batteries and receiver, and loud speaker and frame aerial. Two tuning controls are provided, as well as a thumb control for reaction. The same company has also marketed a new non-spillable type accumulator of the two-volt class, with a capacity of 20 Ah. The electrolite is solid, and substantial brass terminals are provided. The accumulator, when sold, is fully charged.

The Air Route to India.

The wireless organisation for the air mail service to India, which opened on March 30th, has been completed so that the aircraft engaged will be in touch with aerodrome ground stations throughout the 4 700 air miles of the journey. All the aircraft are equipped with Marconi wireless apparatus, and an intercommunicating chain of ground stations has been arranged. The first section of the route, London–Basle, consists of the aerodrome station at Croydon, French stations at Le Bourget and other intermediate places on the route, and Basle. The machines operating this section of the route are fitted with 150 W Marine type AD6 sets. For the second section of the air route, Genoa to Alexandria, the three "Calcutta" flying boats are fitted with Marconi type AD8 sets. These sets are also adaptable for telegraphy or telephony. Imperial Airways, Ltd., have stationed a depot ship at a point in the Greek Archipelago and this is fitted with a 1½ kW valve transmitter (type U) and a Marconi type RG19 receiver. The machines on the third and final section of the route, through Basrah and over the Persian Gulf to Karachi, are De Havilland aircraft fitted with Marconi AD6 apparatus and communicate with R.A.F. stations and a ½ kW station at Rutbah Wells, which was supplied by the Marconi Company to the Iraq Posts and Telegraphs Department. The terminal wireless station at Karachi is a 6 kW transmitter with direction finder receiving apparatus.

TURBINE BLADING.

The B.E.S.A. has recently issued a British Standard Specification for phosphor bronze turbine blading. The requirements specified include the chemical composition of the phosphor bronze, the method of selecting bars for the preparation of test pieces, the form of the test pieces, and the mechanical tests to be complied with: the dimensions of the bars are not standardised. Copies of the Specification No. 352-1929 may be obtained from the Publications Department of the British Engineering Standards Association, 20, Victoria Street, S.W.1, price 2s. 2d., post free.

TRADE PUBLICATIONS.

AS was to be expected at this time of the year METROPOLITAN-VICKERS ELECTRICAL CO., LTD., has sent us a further "Girl" calendar, making the fifteenth in the series. This year's calendar is, as in past years, a thoroughly artistic production, brown in tone and sharp in its definition. The subject this year is Miss Joan Lockton who, it may be remembered, appeared recently in "Lumber Love." The illustration which we give on this page shows that both Miss Lockton and the Metropolitan-Vickers Electrical Co. are to be congratulated on a very pleasing publication.

The latest edition to the series of "Girl" calendars of the Metropolitan-Vickers Electrical Co.

With regard to the recent issue by the SUN ELECTRICAL CO., LTD., 118/120, Charing Cross Road, London, W.C.2, of a catalogue of electrical supplies, apparatus and appliances, it has been found that some stockists are only interested in portions of this list. The company has, therefore, issued a complete set of sections, individually bound in stiff paper covers. The sections cover domestic electrical appliances, signs and flashers, display and industrial lighting equipment, electric fires, lamps, general accessories, switch and fuse gear, fans, motors, charging plant and instruments, electrically operated tools, conduit, fittings, cables, flexibles, wiring systems, line material, bells, bell material, and telephones.

Bulletin No. G577 by STANDARD TELEPHONE AND CABLES, LTD., deals with the cathode ray and oscillograph.

Brochure No. 1 002 E. covering centrifugal pumps has been received from the A.C.E.C., 56, Victoria Street, London, S.W.1.

Booklet No. 201, by PHILIPS' LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, deals with dark room accessories.

TURNER BROTHERS ASBESTOS CO., LTD., Rochdale, have issued a new folder relating to "Sindanyo" insulating board.

MR. ALAN WRIGHT, 142, Chancery Lane, London, W.C.2, has sent a list, No. C1/29, dealing with "Inventum" water heaters.

"Belting from a Single Strand" is the title given to a new brochure by JAMES HENDRY, LTD., of 252, Main Street, Bridgeton, Glasgow.

The BRITISH THOMSON-HOUSTON CO., LTD., Rugby, has published list No. 3 305, dealing with metal clad vertical plugging switchgear, Class Z.

Individual light control is the subject of a new leaflet by J. A. CRABTREE AND CO., LTD., Lincoln Works, Walsall. The reference is No. 1 053.

Booklet 201 by PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, describes and illustrates "Metalix-Portable" X-ray apparatus.

The DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton, Middlesex, has published a special issue entitled "A Book about Steam Traps."

The MARTINDALE ELECTRIC CO., LTD., The Hyde, Hendon, London, N.W.9, has sent us a leaflet embodying a chart on carbon brush and commutator troubles, together with particulars of "Martindale" commstores.

A coloured poster drawing attention to the price reduction of the C.2 model loudspeaker, has been published by the BRITISH THOMSON-HOUSTON CO., LTD. The same company has issued booklet L.451 dealing with floodlighting.

COMPANY NEWS.

Easter Holiday Makes Market Dull—General Electric Activity—Cable Manufacturing Descriptions Unsteady—Marconi Wireless Holdings Improve—Company Reports and Meetings—New Companies Registered.

WITH the Easter holidays intervening, little activity was to be looked for in share markets and there are consequently but few alterations in our usual table of prices. The only outstanding feature is a recovery in General Electric shares. Although, at the time of writing, the discussions between American and English interests with regard to the proposed new share issue are without definite result, the company's shares have been in demand and last week's fall has been partially recovered. Johnson and Phillips and British Insulateds have both fallen, 2s. 6d. and 1s. 3d respectively. Marconi's Wireless have improved 1s. 3d.

Last Annl. Divd.	Description.	This Week.	Last Week.	1926 to 1928. Highest	Lowest.

WARD AND GOLDSTONE, LTD.—Intm. div. of 3½% is announced.

RADIO CORPORATION OF AMERICA.—Gross inc. 1928, $101 861 603, agst. $65 418 620; net inc. $23 661 989, agst. $11 799 650.

CANADIAN GENERAL ELECTRIC CO., LTD.—Qrtrly. div. 1¾% for 3 months endg. March 31, being at rate of 7% p. a., payable April 1.

TRANSMUTOGRAPH, LTD.—This co., which has been formed to manufacture and supply electric luminous devices for showing advertisements and news by day and night, invited subscriptions on March 22 for an issue of 830 000 ord. shs. of 2s. each, at par.

BELL TELEPHONE CO. OF CANADA.—Long distance rev. for 1928 was $8 968 387, agst. $7 950 318, and miscellaneous revs. were $1 336 716, agst. $1 150 520. After provisn. for divs. and placing $250 000 to employees' pension fund, blce. carried to surplus is $931 744.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Net earnings for the twelve months are: Earngs. in 1928, $24 869 330, compared with $22 054 622 in 1927. Gross earnings at $42 774 813, increase $4 454 824. Operating exes. $17 905 483, compared with $16 265 367.

OFFICIAL QUOTATIONS.—Stock Exchange Committee granted official quotations to £50 000 5½% 1st mgte. sinkg. fund deb. stk. of the West Gloucestershire Power Co., 897 000 £1, fully pd., ord. shs. and 20 000, fully paid, 6% cum. pref. shs. of Yorkshire Electric Power Co., $12 045 500 cap. stk. of the American Telephone and Telegraph Co., and 43 307 £1, fully pd., ord. shs. of the Underground Electric Railways Co. of London, Ltd.

BRITISH ALUMINIUM CO., LTD.—Net pft. for 1928, £441 383, agst. £432 176. Taxatn. and proportn. of profits payable to directors, £54 096, agst. £49 584; prior lien deb. service, £60 000 (same as last year); deb. stk. service, £43 224 (the same); to res. for depreciatn., £50 000 (the same); res., £100 000 (the same); to staff benefit fund, £10 000 (the same). Div. for year on ord. shs., 10% (the same); fwd., £33 843, agst. £27 858.

CHELSEA ELECTRICITY SUPPLY CO., LTD.—Net pft. for 1928, £82 227. Intm. div. on pref. shs. at rate of 6% p.a. absorbed £900, and intm. div. at rate of 10d. p. sh. on ord. shs. £16 479. Fin. div. on pref. shs. at rate of 6% p.a., makg. 6% for year, and fin. div. on ord. shs. of 11·3d. p. sh. completing standard div. of 8⅞% for year. To special res. fund (ord. shhldrs' proportn. of consumers' benefit for 1926, 1927 and 1928), £5 069; to pensn. fund, £16 220; fwd. £24 039. Electricity sold was 9 465 940 kWh, increase 653 692.

AMERICAN WATER WORKS AND ELECTRIC CO.—Earngs. in 1928, $51 044 689, agst. $48 727 401; exes., maintenance and taxes, $26 027 657, agst. $25 856 535. Int. and amortisatn. of disct. of subsidiaries, $8 084 495, agst. $8 434 592, pfd. divs. of subsidiaries, $5 138 779, agst. $4 665 140; minority interests, $38 339, agst. $71 730; int. and amortisatn. of disct. of co., $1 298 913, agst. $1 215 908; res. for renewals, retirements and depletion, $4 249 009, agst. $3 653 339. Blce. for divs. and surplus, $6 209 495, agst. $2 860 140.

RADIO CORPORATION.—Gross income of Radio Corporation of America and subsidiary cos. for 1928, $101 851 603, agst. $65 418 621, and deductg. total exes. and depreciatn. left net income $23 661 990, agst. $11 799 650. To reserves for amortisatn. of patents, income tax and employees' pension fund and res. agst. foreign investmts., $3 827 191, compared with $3 321 330 for 1927, includg. $750 000 to gen. res. Transferred to surplus, $19 834 799, agst. $8 478 320. Qrtrly. divs. were paid on A pfd. stk. at rate of 7% p.a., and ann. div. of 7% for year was paid on all shs. of original pfd. stk. not yet exchanged for A pfd. stk.

AMERICAN TELEPHONE AND TELEGRAPH CO.—Rev. for 1928, $235 781 978, agst. $216 524 824, Exes., including depreciatn. and taxes, $70 513 928. Net earngs., $165 268 049, agst. $150 383 894. Int. on bonds, debs., etc., $22 097 557, leavg. $143 170 491, agst. $128 614 910. Divs. at rate of $9 p. sh. p. a. on cap. stk. were paid. Surplus for year, $39 349 051, agst. $31 234 976. Total rev. of Bell system, incorporatg. results of American Telephone and Telegraph and its twenty-four associated operatg. cos., exclusive of

Digitized by Google

inter-co. duplicatns., amtd. to $975 426 823, agst. $894 699 173. At December 31, 1928 total surplus of system amtd. to $373 797 847, increase $76 844 578.

AMERICAN RADIO AND TELEGRAPH MERGER NEGOTIATIONS.—The Radio Corporation and the International Telephone and Telegraph Co. announce that the agreement reported to have been reached between them was merely an accord as to the desirability of a consolidation of their communications interests and a tentative plan under which this might be accomplished when the law so permitted. The managements are aware of what has taken place in the British Empire, France, Germany and Italy in the unification of communications, and believe that it would be to the interest of the United States to have a corresponding unification. In the annual report of the Western Union Telegraph Co. (which discussed similar proposals with the Radio Corporation recently), Mr. Newcomb Carlton, the president, declares in favour of wires in preference to the air as a means of communication. He says, however, that the company is waiting with an open mind for a demonstration of a comprehensive system by radio.

GENERAL ELECTRIC CO., LTD.—At an extraordinary gen. mtg. on March 28, the shhldrs. confirmed the resolutn. passed at a mtg. on March 13, altering the articles of associatn. so as to provide that of the 4 000 000 ord. shs., 1 600 000 are called British ord. shs., and that such British ord. shs. shall not be issued or registered in the name of any foreigner, foreign corporatn., or corporatn. under foreign control, that no transfer of British ord. shs. shall be made to any foreigner, foreign corporatn., or corporatn. under foreign control, and that the directors shall refuse to register any such transfer. At the mtg. on March 28, Sir Hugo Hirst (chn.) said prior to the mtg. of March 13 the co. had entered into an agreement with the British Foreign and Colonial Corporation for the sale of 1 500 000 British ord. shs. for £3 000 000 sterling. The directors had requested the B.F.C. to do what they could in mtg. the objectns. which had been raised by the holders of shs. in America. Two representatives of the committee of American shhldrs. were on their way from America, and the B.F.C. had submitted to them, and to the board, a scheme which appeared to be fair and reasonable to all interests concerned. The scheme was explained in a telegram which the B.F.C. had forwarded to the American representatives then on board the "Aquitania," and of which they had sent the co. a copy. In the telegram the suggestn. was made that arrangemt. be made for the co. to issue 140 853 shs. in the proportn. of one to 16 to existg. shhldrs. at a price to be agreed upon, but not being more than 40s., makg. the issued ord. sh. cap. 2 394 498; that the co. offered two British shs. in respect of every three shs. then held by shhldrs., irrespective of nationality or residence, which wd. absorb 1 596 332 British shs.; and the three Stock Exchange accts. terminatg. say, at the end of May next, be allowed for shhldrs. desiring, or by reason of nationality required to dispose of their rights, to do so. Any rights not sold by, say, the end of May, the Corporation would be prepared to purchase at a price to be agreed. By this method all but 9 170 shs out of the total authorised issue of four million shs. would be absorbed, and these shs. should be left available for issue to co.'s staff at discretion of managemt. The American representatives, Mr. Thos. L. Chadbourne and Mr. H. B. Swope, arrived in London at the end of last week, and had an interview with Sir Hugo Hirst and Mr. M. J. Railing on Tuesday, when the definition of principles was discussed. The company announces that the conversations are to continue on a date not yet fixed.

Company Meetings.

ELGIN ELECTRIC SUPPLY CO., LTD.—Lord Provost Wittet presiding at the recent annual meeting, said they were now in a flourishing, solvent and happy condition. Their plant and buildings were a model for undertakings of that size. The profit for the past year was £2 701. A dividend of 5% was declared, and it was decided to reduce the charge for electricity from 1s. to 10d. per kWh.

FOLKESTONE ELECTRICITY SUPPLY CO., LTD.—Ald. George Spurgeon, presiding at the meeting on March 22nd, said the maximum output of the station was 3 078 kW (in December, 1928), representing an additional 138 kW over 1927, affirming his previous statement that the demand had not reached anything like saturation point. Receipts during the past year were £92 960, an increase of £3 157, although reductions in prices equal to £5 000 were made. The directors recommended a dividend of 6%, tax free, on the ordinary shares, making 10% for the year. Rates and taxes averaged no less than 0·935d. per kWh sold. They had not been able to accept without protest an increase of some 350% in their Folkestone assessment, compared with a general average increase for the town of about 20%, and the board had lodged an appeal.

ENFIELD CABLE WORKS, LTD.—Under the name of the Enfield Cable Works, Ltd., on page 401 of our issue of March 29th, we published, by mistake, particulars of a meeting of another company. At the meeting of the Enfield Cable Works, Ltd., on March 20th, the Earl of Verulam, who presided, dealt with the figures in the accounts. In the course of his remarks, he stated that the profit in the 18 months covered by the accounts was £162 000, equal to £108 000 in 12 months, compared with £102 000 for the year to June, 1927. To complete the dividend of 20% per annum for the 18 months, the board recommended a final dividend of 10%, and they suggested putting £40 000 to reserve and carrying forward £31 649. The report and accounts were adopted, and at a subsequent extraordinary general meeting a resolution was passed to increase the capital to £800 000 by the creation of 350 000 new £1 ordinary shares.

Road Competition.

ISLE OF THANET ELECTRIC SUPPLY CO., LTD.—At the meeting on March 13th, Mr. A. R. Monks, chairman, said owing to increasing competition from motor buses during 1928 the company augmented its tramway services and reduced its fares, and the financial results were, therefore, less favourable than those for the previous year. Their lighting and power business continued to develop, although there had recently been a slight falling off in applications from new consumers. Gross profits were £73 416, an increase of £862. After provision for debenture stock interest and sinking fund, reserve and depreciation accounts, dividend on preference shares, etc., a dividend of 4% on the ordinary shares was proposed. With regard to reports in the Press relative to that company being acquired by one of the larger lighting and power companies, the board had no knowledge of any such proposal. The report and dividends were approved.

LLANELLY AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Mr. A. H. Beatty, presiding at the meeting on March 26th, said the accounts showed a substantial improvement in the trading results, the balance carried to net revenue account being £52 425, an increase of nearly £10 000. The new power plant had been in continuous service since it was put on load in November last, and was operating satisfactorily. During the year 498 new consumers were added and a total of 21 843 400 kWh was sold, compared with 18 300 201. The traction side of the business was affected by motor 'bus competition, but showed some improvement. Although the results of the year were satisfactory, the time had not quite arrived when they could recommend the resumption of dividends on the ordinary shares. If the improvement in trade continued, he thought they could hold out hopes of a resumption of ordinary share dividends at an early date.

PINCHIN, JOHNSON AND CO., LTD.—Mr. Edward Robson, presiding at the meeting last week, moved the adoption of the report and accounts, and that a final dividend on the ordinary shares of 20%, making 30% for the year 1928, less tax, be declared. The net profit, he said, amounted to £422 796, a further record. In every department of the undertaking they were able to record improved results. In practically every market, at home and abroad, further advances had been made in sales, and their manufacturing, marketing and distributing arrangements in the various markets had been further developed and consolidated. After the adoption of the report and the approval of the dividend, the chairman moved that the sum of £344 989, part of the sum standing to reserve, be applied in paying up in full 344 989 £1 ordinary shares, and that such shares be allotted, credited as fully paid, to the ordinary shareholders in proportion to the number of shares held by them. The resolution was passed, and, at a subsequent extraordinary meeting, it was resolved that the £1 ordinary shares be divided into ordinary shares of 10s. each.

INTERNATIONAL AUTOMATIC TELEPHONE CO., LTD.—Sir Alexander Roger, presiding at the meeting on March 27th, said the profit for the past year was £130 823, compared with £124 369. After paying for preference dividend and interim dividend on the ordinary shares, it was proposed to transfer £10 000 to reserve and to pay a final dividend of 6¼%, less tax, on the ordinary shares, making 10% for the year, a bonus of 2½%, less tax, on the ordinary shares, and a dividend of 10%, with a bonus of 2½%, less tax, on the deferred shares, leaving £69 735 to carry forward, against

Digitized by Google

£59 292. Competition in their field, which lay overseas entirely, continued to be keen, and changes and developments were constantly taking place. By reason of the excellence of the products of Automatic Telephone Manufacturing Co., and the standing which the Strowger system had secured throughout the world, they had hitherto secured their fair share of the business available, and with the resources at their disposal, both technical and financial, they hoped to continue to secure their share.

The N.E. Coast Exhibition and Electricity.

NEWCASTLE AND DISTRICT ELECTRIC LIGHTING CO., LTD.—Col. F. R. Simpson, presiding at the recent annual meeting, said the steady increase in the demand for electricity continued, its advantages for 'cooking and heating being more widely recognised. The cost of wages, salaries, coal and repairs during the past year was £47 048, an increase of £337; rent, rates, taxes and insurance amounted to £21 962, increase £2 481. The amount paid in local rates was £10 090, and he regretted that, owing to the company being a public utility company, no relief could be obtained under the new Rating Act. The total receipts for energy supplied and for rents increased £3 599. Electricity sold showed an increase of 8%. The directors had decided to make some reduction in the price charge for lighting, but they fully anticipated that it would lead to an increased consumption, and, in addition, it was contemplated that more current would be used this summer on account of the exhibition. The net profit for the year was £17 906, which, added to £15 658, brought forward, made an available balance of £33 564, which the directors recommended should be dealt with in the payment of a dividend at the rate of 7½%, less tax, for the year, carrying forward £15 564.

EINSTEIN ELECTRO-CHEMICAL PROCESS, LTD.—At the statutory meeting last week, Col. the Master of Sempill (chairman) said the process to be practised by the company was the result of some 20 years' research, and constituted a number of improvements on existing practice, and enabled the art of electro deposition to be greatly extended on a commercial scale. There was a big field for the extension of the process, not only in present methods of manufacture, but in new ideas, and opening fresh possibilities to industries. They had taken on lease a factory at Slough, and it was hoped that production would commence in about three months' time. Mr. Einstein, at his own request, had been relieved of the routine duties of managing director, and was, at present, concentrating, with the other technical staff, on the lay-out and equipment of the factory. The company had secured the services, as general manager, of Mr. H. Kerr Thomas, who had been for ten years in charge of the Pierce-Arrow automobile factory in the U.S.A. Negotiations for the sale of foreign rights and the granting of licences to important firms were proceeding. The company had actually received 1 107 trade inquiries from the United Kingdom, 40 trade inquiries from foreign countries, 58 applications for the granting of licences in the United Kingdom and 105 applications for the sale of patent rights and the grant of foreign licences.

RADIOVISOR FOREIGN AND COLONIAL, LTD.—At the statutory meeting last week, the Duke of Atholl (chairman) said no time had been lost in starting negotiations for the sale of their rights to the chief electrical manufacturers on the Continent. During the last four weeks their managing director and general manager had been almost continuously on the Continent, assisting with the testing of their products by the distinguished scientists appointed by the concerns with whom they were in negotiation. According to the reports received from the manufacturers concerned, the tests had shown that the company's light-sensitive bridge had properties which, for certain purposes, made it superior to any other device of a like nature. In the course of a few days they anticipated being able to make a satisfactory agreement for the manufacture and distribution of their devices throughout the Continent of Europe by one of the most powerful firms of electrical engineers in the world. The patent position had been greatly strengthened by the grant of letters patent for their basic invention, corresponding to British Letters Patent No. 284 942 of 1927, in Belgium, France, South Africa and Spain, and acceptances in Denmark, Canada, India, Japan, Russia, Yugoslavia, and New Zealand. They intended to send a demonstration plant to New York.

BRITISH ALUMINIUM CO., LTD.—Lt.-Col. S. H. Pollen, presiding at the meeting on March 27th, said the net profit for the past year was £441 383, against £432 176 for the previous year. In the field of electrical industry a most striking expansion of the use of the metal had occurred in recent years, and the year 1928 showed a considerable advance in this direction over its predecessors. Stranded aluminium cables with a core of steel had established themselves still more firmly as serious rivals to copper cables for power transmission, because, for equal conducting capacity, they were stronger, lighter and considerably cheaper. These conductors had been adopted for the British national grid of high voltage lines which were being erected under schemes approved by the Central Electricity Board. For the first two sections of the grid a total of some 3 500 miles of conductor was required, and the metal for these conductors had been ordered from the company. With regard to the Lochaber water power works, the concrete lining of the tunnel had progressed at an increasing rate throughout the year, and at the present date approximately seven miles out of the total length of fifteen had been lined. The board had every hope that the contract would be completed and that the factory would be in operation in the course of the current year. The report and accounts were adopted.

AUTOMATIC TELEPHONE MANUFACTURING CO., LTD.—Sir Alexander Roger, presiding at the meeting last week, said, after dealing with the directors' report (abstracted in our issue of March 22nd), the position to-day was that there were 72 000 lines of Strowger equipment completed by, and on order, with the company, of which nearly 35 000 lines were already in service. To this total they should add the Coder call indicator equipment, averaging three positions at each of some 80 manual exchanges and mechanical tandem exchanges, equipped by them for inter-communication during the transition period. They were now engaged in the manufacture of the equipment for the main Strowger automatic exchange at Blackfriars, Manchester. Development and research continued an all-important part of their work, since it represented a protective measure ensuring that the company kept in the forefront of the art. Within the period under review the company had shipped additional apparatus for extending eleven exchanges in the Buenos Ayres (Argentine) network. Australian orders included equipments for three new Strowger exchanges, while an equipment for Mansoura marked the introduction of Strowger automatic telephones into Egypt. The "Xcel" domestic appliances branch of their business, centred at the Broadgreen factory, continued to expand in spite of a highly competitive market, and their sales of these appliances were up by 80%. The report was adopted, and the dividend of 6¼%, making 10% for the year, and a bonus of 2½%, less tax, were approved.

Trade Difficulties in the North.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD.—At the annual meeting on March 26th, Mr. R. P. Sloan, chairman, said last year proved to be one of the worst periods experienced by the coal trade in Northumberland and Durham, excluding the strike year, 1926, and no great improvement was shown in shipbuilding and engineering. The year's profit showed an improvement of £35 963, which he thought satisfactory, bearing in mind the unsatisfactory condition of trade generally. The transfer to general reserve was the same as in the previous year, £150 000, but the transfer to renewals and improvements reserve had been increased to £60 000, against £50 000. The directors recommended a dividend at the same rate as that paid in the previous year, viz., 6%, and that the balance of profit be carried forward, which would make the total sum to be carried forward to the current year £80 653. The expenditure on capital account during the year amounted to £318 811. Additions to reserve for special depreciation and contingencies amounted to £319 890, made up of £150 000 from profit, £8 159 contributions from consumers towards cost of connections, and £161 731 premiums received on account of issue of ordinary shares. After provision for items on the debit side, including the balance of the item representing discount on and expenses of issue of debenture stocks, which totalled £409 074, they were still left with the substantial balance of £761 359 in this reserve. They were continuing to develop their domestic business, principally concentrating on the filling up of networks already laid. The Derating Act, in effect, put a premium on privately owned stations, which would be an inducement to the continuance of those now in operation and might also prove an inducement to installing new private plants. The report was adopted, and dividends of 3½% on the 7% cumulative preference shares, making 7% for the year, 2½% on the 5% preference shares, making 5% for the year, and 3½% on the ordinary shares, making 6% for the year, all less tax, were approved.

NEW COMPANIES.

EROS (DUNDEE), LTD.—Cap., £2 000. Electricians, electrical engineers, etc. Reg. Office: 27, Crichton Street, Dundee.

G. F. BILLING & Co., LTD.—Cap., £100. Electricians, wireless engineers, etc. Reg. Office: 41, Cheapside, London, E.C.2.

AUTOCAR ELECTRICAL CO., LTD.—Cap., £2 500. Electricians, battery chargers, etc. Solicitor: H. H. Vowles, 65, Northgate Street, Gloucester.

SERVALL ELECTRIC CO., LTD.—Cap., £1 000. Electrical and general engineers, contractors, etc. Reg. Office: 46, Hamilton Road, Cambuslang.

BRITISH ELECTRICAL GRID CO., LTD.—Cap., £300. Electricians, electrical and general engineers, etc. Reg. Office: 45/6, West Sunniside, Sunderland.

ELECTRICAL MANUFACTURERS FINANCE CO., LTD.—Cap., £10 000. Financiers, bankers, etc. Solicitor: A. R. Monks, Crown House, Aldwych, London, W.C.2.

ACCUMULATOR CO. OF SCOTLAND, LTD.—Cap., £100. Manufacturers and repairers of batteries and magnetos, etc. Reg. Office: 101, West Nile Street, Glasgow, C.1.

EAST DEVON ELECTRICITY CO., LTD.—Cap., £10 000. To carry on business of electricity supply company. Solicitor: Horace Davey, 47, Parliament Street, London, S.W.1.

MODERN ELECTRICAL SUPPLIES (LEEDS), LTD.—Cap., £500. Electricians, electrical engineers and contractors, suppliers of electricity, etc. Reg. Office: 98B, North Street, Leeds.

SUN-RAY ELECTRIC LAMP CO., LTD.—Manufacturers of and dealers in electric lamps, fuses and signs, dealers in electrical and wireless apparatus, etc. Reg. Office: Wash Lane, Clacton-on-Sea.

E. JEFFERY, LTD.—Cap., £1 000. To acquire business of manufacturing electrical engineers, etc., heretofore carried on at 22, Denmark Place, Charing Cross Road, London, W.C. as "Jeffery and Co."

GORDON HUGHES ELECTRICAL CO., LTD.—Cap., £1 000. Electrical contractors, manufacturers of and dealers in electrical accessories, wireless, telegraphy, telephony and television parts, etc. Reg. Office: 163, Moor Street, Birmingham.

BRITISH AND POLISH ENGINEERING CO., LTD.—Cap., £5 000. To acquire and obtain contracts for the construction of electric lighting plants, etc., in Poland or elsewhere in Europe, etc. Reg. Office: Lincoln House, 300, High Holborn, London, W.C.1.

SOUTHERN COUNTIES ENGINEERING CO., LTD.—Cap., £2 000. To acquire business of general engineers at present carried on as the "Southern Counties Engineering Co." and to carry on business of general and electrical engineers, etc. Reg. Office: Trading Estate, Slough, Bucks.

BRECKNELL, WILLIS AND CO., LTD.—Cap., £20 000. To adopt agreement with Thrissell Engineering Co., Ltd., to carry on business of traction engineers, formerly carried on at Jacob Street, Bristol, and that of mechanical and electrical engineers, dealers in electrical apparatus. Reg. Office: 114, Jacob Street, Bristol.

MEECH ELECTRIC DRIVES, LTD.—Cap., £5 250. Electrical and general engineers, contractors for and dealers in electric motors, electric switch gear, control gear, and all appliances and apparatus for generation, supply, use and control of electric power, etc. First director: J. Meech, 95, Mayow Road, Sydenham, London, S.E.26.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

CHAPMAN, Mr. J., 29, Grovedale Road, Mossley Rill, electrical engineer. £15 15s. 6d. January 22nd.

HACKETT, Alfred Reginald, 185, London Road, Hazel Grove, motor engineer and wireless dealer. £22 19s. 8d. December 12th.

HAMBLING, CLAPP AND CO., LTD., 21, Garrick Street, W.C., wireless factors. £10 12s. 10d. January 1st.

HAYES END ELECTRICAL STORES, London Road, Hayes End, electricians. £22 8s. January 28th.

HOOK, Victor, Electric Light Yard, West Street, Bromley, electrical engineer. £22 11s. 2d. January 18th.

SMITTEN, A. E., 110, Forest Road, Leicester, electrical engineer. £19 19s. 1d. December 19th.

Deeds of Arrangement.

FRY, Horace Dorland, trading as ASHTON ELECTRIC CO. and ASHTON SERVICE CO., 33, Naylor's Row and 5, Spring Bank, Hull, dealer in wireless and electrical apparatus. Dated March 20th, filed March 27th. Trustee, S. G. Oxley, Commercial Chambers, Commercial Road, Hull, I.A. Liabilities unsecured, £1 545; assets, less secured claims, £497.

RUTHERFORD, Albert, Plowmans Yard, Church End, and 20, West Way, Finchley, electrician. Dated March 13th, filed March 20th. Trustee, W. A. J. Osborne, 119, Finsbury Pavement, E.C., accountant. Liabilities unsecured, £689; assets, less secured claims £175.

Bill of Sale.

ROBINSON, George William, 74, Northumberland Road, Old Trafford, electrical engineer. Dated March 18th, filed March 19th. £40.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

ALLITE, LTD., London, E.C., dealers in electrical goods, etc.—Registered March 18th, £2,000 debentures; general charge.

BAXTER AND CAUNTER, LTD., London, W., electricians.—Registered March 19th, debenture and two Land Registry charges collateral thereto, to Bank; charged on 219, Tottenham Court Road, and 8, Alfred Place, also general charge. *£12 440. July 17th, 1928.

London Gazette, etc.

Companies Winding-up Voluntarily.

ELECTROMOTORS, LTD. By special Resolutions, March 11th, confirmed March 26th. F. S. Abbott, chartered accountant, 40, South King Street, Manchester, appointed as liquidator for the purposes of amalgamation. Meeting of the creditors at the offices of Abbott and Son, 40, South King Street, Manchester, on Thursday, April 11th, at 2.30 p.m. All creditors will be paid in full.

SWINDEN AND CO., LTD.—By reason of its liabilities, March 26th. R. M. Pembridge, chartered accountant, Lincoln House, 296, High Holborn, London, W.C., appointed as liquidator. Meeting of creditors at the Institute of Chartered Accountants, Moorgate Place, London, E.C.2 (entrance, Great Swan Alley), on Thursday, April 11th at 3 p.m.

Winding-up Petition.

ZONE WIRELESS CO., LTD. A creditor's petition for winding-up has been presented by Marconi's Wireless Telegraph Co., Ltd., Marconi House, Strand, London, W.C., and is to be heard at the Royal Courts of Justice, Strand, London, on April 15th.

Bankruptcy Information.

SMITH, Boulton (trading as H. WORTON), The Crescent Spalding, electrical engineer. Receiving order, March 23rd. Debtor's petition. First meeting, April 5th, 11.30 a.m., White Hart Hotel, Spalding. Public examination, April 26th, 10.45 a.m., Law Courts, Peterborough.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

306 172 E. F. Russ. Induction furnaces. (15/11/27.)
306 197 A. Reyrolle and Co., Ltd., B. H. Leeson and R. H. Brierly. Electric fuses. (21/11/27.) (Addition to 276 740.)
306 198 A. Reyrolle and Co., Ltd., J. Mirrey and A. Allan. Electric switches. (21/11/27.)
306 211 E. W. Challans and Westinghouse Brake and Saxby Signal Co., Ltd. Electromechanical devices of the induction type. (29/11/27.)
282 392 R. Sarazin. Electrode holders for arc welding. (18/12/26.)
306 232 T. F. Wall. Electromagnetic testing of steel-wire ropes and other articles of magnetisable material. (20/12/27.)
282 766 British Thomson-Houston Co., Ltd. Electric discharge devices. (23/12/26.)
301 478 Langbein-Pfanhauser-Werke Akt.-Ges. Electrolytic deposition of chromium. (1/12/27.)
306 249 J. A. Crabtree and J. R. Dolphin. Manufacture of moulded articles, such as switch bases, fuse holders and other electrical apparatus. (12/1/28.)
306 253 A. F. Pollock and D. A. Pollock. Inter-valve couplings for thermionic valves. (16/1/28.)
306 268 W. Bryan. Loud-speaker apparatus for wireless telephony. (6/2/28.)
306 278 E. J. Marriott and C. French. Loud-speaking apparatus for wireless or other purposes. (11/2/28.)
306 281 M.O. Valve Co., Ltd., A. L. Reimann and J. W. Ryde. Manufacture of thermionic cathodes for electric discharge devices. (20/2/28.)
306 292 J. L. V. Armstrong (Telefunken Ges. fur Drahtlose Telegraphie). High-frequency telephone systems. (3/3/28.)
286 647 British Thomson-Houston Co., Ltd. Electric meters. (7/3/27.)
296 363 Siemens and Halske A.G. Circuit arrangement for telephone installations with main and branch exchanges and selector working. (30/8/27.)
296 424 Siemens and Halske A.G. Circuit arrangement for double-duty selectors in telephone installations. (1/9/27.)
306 312 E. Thomas and Williams, Ltd., and J. Bowen. Electric accumulators. (2/4/28.).
288 606 International General Electric Co., Inc. Current transformers. (13/11/27.)
306 323 Siemens Bros. and Co., Ltd., and D. P. Long. Telephone systems. (17/4/28.)
296 299 Siemens-Schuckertwerke A.G. Sheet-metal laminated cores for dynamo-electric machines. (27/8/27.)
306 336 Maxlume Lighting and Heating Co., Ltd., and F. W. Thorpe. Electric light fittings. (4/5/28.)
306 337 C. Nunn. Electric switchgear. (4/5/28.)
291 058 British Thomson-Houston Co., Ltd. Induction voltage regulators. (25/5/27.)
306 344 Hermsdorf-Schomburg-Isolatoren Ges. Protective arrangement for springs used in association with electrical apparatus. (1/5/28.)
292 922 Metropolitan-Vickers Electrical Co., Ltd. Electrical circuit-controlling apparatus. (24/6/27.)
294 171 Siemens Schuckertwerke A.G. Liquid seal between chambers or spaces of different pressure. (19/7/27.)
295 710 Dr. W. Rogowski and Dr. E. Flegler. Cathode-ray oscillographs. (18/8/27.)
295 592 Felten and Guilleaume Carlswerk A.G. Avoidance of cross-talk in telephone cables. (11/8/27.)
295 601 Marconi's Wireless Telegraph Co., Ltd. Means for transmitting radiant energy such as light, and apparatus for use therewith. (13/8/27.)
297 004 Marconi's Wireless Telegraph Co., Ltd. Circuit arrangements for use in high-frequency communication systems. (10/9/27.)
301 021 Siemens Schuckertwerke A.G. Electric signalling circuit for use in mines. (23/11/27.)
306 378 C. O. G. Taylor. Trolly-heads for electric traction. (14/9/28.)

Applications for Patents.

February 9th.

4 445 E. A. Bayles and British Insulated Cables Ltd. Coating wires with metal.
4 444 F. L. Brislee and British Insulated Cables, Ltd. Insulation of electric cables.
4 419 A. P. C. Collier and E. F. Stephenson. Electric circuit control devices.
4 369 J. A. Crabtree. Electric insulators.
4 416 E. J. Francois. Electric wire attachments.
4 417 W. Germershausen. Electric discharge tubes. (14/2/28, Germany.)
4 371 J. A. Higgins. Automatic electric switches.
4 411 R. G. Kennard. Magnetic relay amplifiers, etc.
4 356 Landis and Gyr Soc. Anon. Driving system for a.c. meters. (24/3/28 Switzerland.)
4 426 C. Lorenz Akt. Ges. Apparatus for transmission, etc., of ultra short waves. (12/5/28, Germany.)
4 384 F. Merk. Telephone installations. (5/3/28, Germany.)
4 405 B. D. Space. Thermostatic device for controlling electric circuits.
4 364 E. A. Tyrrell. Electrical signal apparatus for motor cars.

COMING EVENTS.

Friday, April 5th.

Institute of Transport (Leeds and District Section).—Annual genera meeting. 7 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. E. W. Hill on "Some Technical Considerations Concerning Power Factor in Relation to Tariffs." 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre Students' Section).—Lighting Service Bureau, Dial House, Northumberland Street, Newcastle-on-Tyne. Annual general meeting. 7.15 *p.m.*

Monday, April 8th.

Royal Institution of Great Britain.—21, Albemarle Street, London. General meeting. 5 *p.m.*

Electrical Contractors' Association (Hastings Sub-Branch).—Lewcocks' Restaurant. Ordinary meeting.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting. 3 *p.m.*

Institution of Electrical Engineers (Western Centre).—Council Chamber, Guildhall, Plymouth. Lecture by Mr. H. C. Sanders, on "Water Heating." 6 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Annual general meeting. Paper by Mr. B. L. Goodlet on "The Testing of Porcelain Insulators." 7 *p.m.*

Tuesday, April 9th.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers. Ordinary meeting.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Institution of Civil Engineers.—Great George Street, Westminster. Paper by Mr. H. Hall on "The New Piccadilly Circus Station." 6 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—17, Albert Square, Manchester. Annual general meeting. Papers by The Hon. Sir C. A. Parsons, F.R.S. and Mr. J. Rosen on "Direct Generation of Alternating Current at High Voltages," and Mr. J. A. Kuyser on "Recent Developments in Turbo-Generators." 7 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Annual general meeting. 7 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—Royal Technical College, Glasgow. Annual general meeting. Paper by Messrs. E. B. Wedmore, W. B. Whitney and C. E. R. Bruce on "An Introduction to Researches on Circuit Breaking." (Electrical Research Association Report.) 7.30 *p.m.*

Electrical Association for Women (Manchester Branch).—Corporation Electricity Showrooms, 28, St. Ann Street. Lecture by Miss G. L. Entwisle on "Elementary Facts about Electricity." 7.30 *p.m.*

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting. 7.30 *p.m.*

Wednesday, April 10th.

Rugby Engineering Society.—Benn Buildings. Paper by Mr. H. Jack on "Recent Developments in A.C. Machines."

Electrical Contractors' Association (Eastbourne Sub-Branch).—South Street. Ordinary meeting.

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting. 5.30 *p.m.*

Institute of Fuel.—Chemical Society, Burlington House, Piccadilly, London. Paper by Major W. Gregson, "Some Notes on Waste Heat Recovery." 6 *p.m.*

Royal Society of Arts.—John Street, Adelphi, London. Lecture by Mr. G. H. Nash on "Some Modern Aspects of Electrical Communication." 8 *p.m.*

Thursday, April 11th.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. B. L. Goodlet on "The Testing of Porcelain Insulators." 6 *p.m.*

Friday, April 12th.

Royal Society of Arts.—John Street, Adelphi, London. Lecture by Mr. A. T. Cooper on "Recent Electrical Developments in India." 4.30 *p.m.*

Saturday, April 13th.

Association of Mining Electrical Engineers (Western Sub-Branch).—Swansea. Annual dinner.

Institution of Electrical Engineers (South Midland Students' Section).—Afternoon visit to Messrs. General Electric Co., Witton.

LONDON ELECTRICAL ENGINEERS (R.E.).

26th A.A. Battalion R.E. (T.A.).—Arrangements have been made for single-day camps at the School of A.A. Defence, Biggin Hill, on the following dates:—301 Coy., April 20th–21st; 303 Coy., May 4th–5th; 302 Coy., June 8th–9th. The annual camp will be held at Manston (near Margate) from August 18th to September 1st, and it is hoped again to arrange for detachments to live out on the searchlight sites. Lt.-Col. E. V. Gabriel has been appointed Honorary Colonel of the Battalion. The telephone number of Battalion Headquarters at the Duke of York's Headquarters has been changed to Sloane 8866.

27th A.A. Battalion R.E. (T.A.)—In Battalion Orders for April the retirement of Capt. S. W. P. Goodwin is announced on attaining the age limit. A new Trade Testing Board has been appointed, with Major P. F. Foulger as President. The members are: Capt. H. Leigh, Lt. T. H. Solomon, Lt. F. B. Allcock, and 2nd Lt. W. H. Stillwell, with 2nd Lt. H. Wright in attendance. Recruiting has been good, over 40 having joined since last camp, but more recruits are urgently needed. The Officers' Mess annual dance will be held at Headquarters, Rochester Row, London, S.W.1, on April 13th, from 8.45 p.m.

Trade with Russia.

MUCH has been made of the fact that one of the firms represented on the British Industrial Delegation to Soviet Russia has been promised a substantial order, but gratification at this gesture is inevitably discounted by the Soviet demand for the resumption of normal diplomatic relations as a necessary preliminary to the resumption of trade between the two countries. Though there is no question that Russia is a market which, under stable government, might provide an outlet for British electrical production, recent happenings strengthen the view that, in general, British sales policy is more profitably pursued in other directions, and that firms contemplating Russian business should still regard such experiments in a speculative light. It is true that some American electrical firms are getting orders from Russia. Even as we write the news is to hand that two American concerns are sharing a £500 000 order for equipment for the Dnieper hydro-electric station. The contract involves the giving of five years' credit. If business on such terms is considered to be worth having it can be obtained. In this connection a shilling booklet by Dr. E. Luboff, entitled "Can We Trade with Russia?" (London: Anglo-Russian Press) is deserving of study. Here it is shown that the schemes for industrialisation on a grand scale are literally worthless, and that in any case the hypothetical orders for these requirements are subject to enormous loans and "political friendship." In addition to long-term credits for the actual equipment, additional "free monetary" credits are required to enable the Soviets "to build the factories where the equipment could be placed, to erect the necessary houses for the accommodation of the workers to be employed when the factories are completed, to buy raw and semi-raw materials, and to have sufficient money left for working capital to keep the factories going." Put at an almost absurdly optimistic level, the possible orders we might get from Russia would amount in a year to £30 000 000, but to secure this credit business we should have to put up the enormous sum of about £145 000 000. Although Dr. Luboff despairs of any trading extension, along normal lines, or in conformity with the fantastic demands of the Soviets, he is still able to give an affirmative answer to the question of his title and to formulate a plan which he claims would give us a possibility of £20 000 000 worth of trade annually without any financial risk whatever. But even under his plan—which boils down more or less to a system of barter—it is doubtful whether the electrical industry would secure a very large proportion of the total.

How Not to Sell.

A CERTAIN company which is offering to the public by circular "a free trial for two months" of any number of the lamps which it supplies at discount terms of 20%, with further discounts of 5% for 50 and 10% for 100 lamps ordered, is also responsible for the dissemination of an argument which is not to the advantage of the industry or the consumer, and as it is put forward as "expert advice" it may receive undue credence. "Very often," they say, "lamps of unnecessarily high wattage, such as 60 W, are used in positions where a high candle power is not really essential, and if you could manage to halve the wattage of every lamp which you use you would automatically halve your electric light bill." At a time when people are only beginning to realise the advantages of adequate illumination, advice of this kind is to be deprecated. There are few situations in a house which do not need lamps of at least 60 W. If consumers want to economise in lighting there are better ways than decreasing the wattage of lamps. The provision of a number of extra light sources of low intrinsic brilliancy for use when maximum general illumination of a room is not required, and cultivation of the easy habit of switching off lights when they are not actually needed leads to really economical and satisfactory lighting.

The Unwanted Window.

ALTHOUGH tradition bids us put windows in all buildings, many of them are quite unnecessary in offices and the big shops. Daylight, when there is any, is nominally free, but its quality varies from hour to hour and it costs a remarkable amount of money to bring it into the buildings, not only on capital account but also for keeping the windows clean and the frames painted, the provision of curtains, blinds, etc. And when we have gone to all that trouble and expense artificial light must still be used during a portion of most days. In department stores, where artificial illumination is necessary throughout the day, the

Digitized by Google

mixture of natural and artificial light near the windows is most unsatisfactory, while in offices, where the outlook from a window is usually only of a row of roofing, its presence is only a useless distraction from work. The design of many of our office buildings is severely limited by the necessity for balanced fenestration, with the result that our offices have windows in unsuitable positions, and their size and shape are arbitrarily determined by this unalterable factor. To those who do not work in the crowded cities these points may seem to constitute a rather exaggerated picture of what may happen in the distant future, but we think that those with experience of city life to-day will agree that the windowless office and store will come in our time. It is certainly a possibility worthy of careful consideration. The rapidly developing art of architectural lighting is surely paving the way for this revolution. Even now the lighting of business premises is assuming large proportions and providing our central stations with individual loads of hundreds, and in some cases thousands of kilowatts, and it may well be that the elimination of unwanted windows will make the lighting load the most desirable of all to many supply undertakings.

Electric Sign Maintenance.

WHILE it is acknowledged that electric advertising signs provide a desirable off-peak load for central stations, it it not so generally recognised that ill-kept signs mean a real loss of revenue to the supply authority. A recent inspection of 378 signs in New York revealed that those signs had no fewer than 4 588 unlighted lamp sockets. Assuming the lamps to be of 10 W each, the electricity suppliers would lose 45·8 kWh per hour, and as the average electric sign burns for about 2 000 hours a year the annual sales of energy lost to the suppliers would be 91 600 kWh—a sufficient reason for the adoption of a sign maintenance plan. The lamp manufacturers should also be interested in sign maintenance, for of course every burned-out lamp represents a potential sale.

A Lighting Fallacy.

THE fallacious idea that longevity is the best and only test of the qualities of an electric lamp is one that persists, though a moment's thought is sufficient to show its futility. We only mention the point again now because a firm of shopkeepers, who had a lorry through their windows, found that while a lighting pendant was smashed the lamp inside it was not. Delighted to see such evidence of strength they wrote to the lamp manufacturers about it, and mentioned that the lamp had been in use for over two years, and was still doing useful work. Of course, it is no rare thing to hear of similar instances, and if it were thought desirable, lamps with still longer lives might be produced. But so long as it is considered that lamps will give the most satisfactory lighting service when designed for a normal life of 1 000 hours, people who burn their lamps for 3 000 or 4 000 hours are indulging in a peculiar form of false economy. Once a lamp is past its period of maximum effective service, not only does its illuminating efficiency decrease, but the consumer uses and pays for just as much energy as he would with a new lamp. Many people, through sheer ignorance, are as proud of the age of their lamps as of the contents of a well-planned wine-cellar. Electrical men coming into contact with such people might, with advantage, demonstrate the futility of judging a lamp on its age alone.

Britain's Contribution to America's Export Trade.

AMERICAN electrical export figures for the year 1928 show that more than 50% of the total was shipped to the Western Hemisphere. The United Kingdom was the leading consumer of portable electric tools, parts for motors, insulating material, insulated copper wire and cables, and electrodes for electric furnaces, holding the doubtful honour of being the most important market in the United States' trade with European countries in the past year. On the domestic appliances side it is interesting to note that out of a total shipment of 60 269 vacuum cleaners to all parts of the world, 29 018, or nearly half the total, were absorbed by this country, while Australia, Canada, South Africa, and New Zealand imported between them 17 948 machines. These figures mean that of the total of 60 269 cleaners sent overseas by American manufacturers, 46 966 were absorbed by the British Empire, leaving only 13 303 for the rest of the world. That this state of affairs is not to our liking goes without saying, and though there may be some reason for the colonial preference for American cleaners, surely there can be none in this country. With the E.D.A. selling campaigns pulling such weight, we feel that something should not only be done, but that it should be done quickly, or else before very long the E.D.A. may become a selling propagandist—for America's domestic appliances, with the financial support of British manufacturers.

A Japanese Problem.

ONE after another, foreign countries are realising the wastefulness of haphazard development of the electricity supply industry, and the latest convert is Japan, where, according to latest advices, a special Government Committee has been appointed to investigate the desirability of unified control. The primary reason for the appointment of the Committee is, however, an unusual one, for it is simply that for some time past there has been a production of energy surplus to the requirements of users. But in a country where, as was recently reported, the consumers go on " strike " as a protest against high prices for electrical energy, such a situation does not seem altogether unnatural.

The Five-Day Week.

THE report that the American General Electric Co. has decided to put all its factories on a five-day week schedule has revived interest among British electrical firms in the possibilities of this desirable reform. As most of our readers are aware, the staffs of THE ELECTRICIAN and associated enterprises have for several years enjoyed the advantages of the five-day week. Experience has amply proved that the longer week-end is definitely beneficial to employers, in the improved health and therefore greater efficiency which it promotes among the workers. Office and factory heating, lighting and cleaning costs for a half-day's work—and usually a short one at that—are unnecessary expenditure when equivalent production can be secured by a little extra concentration during the five full working days. As pioneers of the five-day week in this country we unhesitatingly affirm its desirability from all points of view, and, as we would like to see more people participating in its advantages, we hope that the example of the American G.E.C. will be widely followed by British electrical firms.

" A Golden Jubilee of Electric Light."

DURING recent times it has been firmly established that the credit for the invention of the incandescent electric lamp belongs to the late Sir JOSEPH SWAN. But for the mistaken notions about this fundamental English discovery which have gained currency abroad it would have been almost unnecessary to emphasise this fact, except on the recent centenary of the inventor's birth, and the jubilee of his lamp invention, as most of us have for long years been fully aware of the world's indebtedness to this great British scientist. In the United States, however, preparations are now in hand for a nation-wide celebration, from June to October, of the " golden jubilee of electric light," the announcements of this celebration being linked with the statements that " the fiftieth anniversary of Edison's incandescent lamp should be the occasion for widespread jubilation." This claim may be strictly true if applied solely to Edison's own lamp, but if this is the intention it would be only fair to mention that the jubilee of the invention of the first incandescent electric lamp was celebrated last year.

ELECTRICAL CIRCUIT THEORY BASED ON THE METHOD OF COMPLEX NUMBERS.

The Expression of Circuit Constants by Means of Complex Quantities—Practical Application to Theory of Alternating Currents.

By G WINDRED.

(*Concluded from page* 411).

WE proceed in the present section to demonstrate the applications of the foregoing methods to the representation of alternating current circuit constants. The property of admittance, and its components, conductance and susceptance, are by this means rendered more readily understandable and applicable to actual problems than is the case when ordinary methods are employed.

It appears to the writer that some apology is due to those readers who are already fully acquainted with the inverse methods, as they are sometimes called, but since the modern tendency seems rather to neglect than to employ these methods, a brief demonstration on the lines of complex representation may be pardoned.

From the preceding remarks it is clear that the vector representing the impedance of any circuit of resistance R and reactance, X is expressible in the various forms:

$$Z=\sqrt{R^2+X^2} \quad \text{(Algebraical)}$$
$$\mathbf{Z}=R+jX \quad \text{(Complex)}$$
$$\mathbf{Z}=me^{j\theta} \quad \text{(Exponential)}$$

in which m is the modulus, and θ the argument, $=\tan^{-1}\frac{X}{R}$ of the vector.

Similarly, the voltage vector is expressed

$$E=\sqrt{E_R^2+E_X^2}$$
$$\mathbf{E}=E_R+jE_X$$
$$\mathbf{E}=me^{j\theta}, \text{ where } \theta=\tan^{-1}\frac{E_X}{E_R}$$

and the current vector

$$I=\sqrt{I_R^2+I_X^2}$$
$$\mathbf{I}=I_R+jI_X$$
$$\mathbf{I}=me^{j\theta}, \text{ where } \theta=\tan^{-1}\frac{I_X}{I_R}$$

If sufficient capacity reactance exists to make the current lead the voltage, the above equations hold good for the usual method of representation in Cartesian co-ordinates, but when the current lags behind the voltage, as in an inductive circuit, it is necessary to substitute a minus sign wherever plus occurs in the above equations; thus obtaining a new set of equations which are conjugate to the foregoing. This, however, is a matter of convention which is not likely to introduce difficulty.

Reciprocal of Impedance.

There are many instances in which advantages may be obtained from the use of the reciprocal of impedance, which quantity Steinmetz calls the Admittance of the circuit. Its components are termed Conductance and Susceptance, the former of which is expressed as the ratio I_R/E, and the latter as the ratio I_X/E, where I_R is the current in phase with E, and I_X is the reactive current in quadrature to E. The equation relating these values is then

$$Y=\sqrt{g^2+b^2}, \text{ or } \mathbf{Y}=g+jb$$

where g is the conductance and b the susceptance. Since $Y=Z^{-1}$, it follows that

$$I=EY=E\sqrt{g^2+b^2},$$
and $$\mathbf{I}=\mathbf{E}\mathbf{Y}=\mathbf{E}(g+jb).$$

Also we have

$$E=\frac{I}{Y}=\frac{I}{\sqrt{g^2+b^2}},$$
$$\mathbf{E}=\frac{\mathbf{I}}{\mathbf{Y}}=\frac{\mathbf{I}}{g+jb};$$
$$Y=\frac{I}{E}=\sqrt{g^2+b^2},$$
$$\mathbf{Y}=\frac{\mathbf{I}}{\mathbf{E}}=g+jb.$$

Whether the equation of impedance or of admittance is used in a calculation depends upon the form of the circuit and the attendant circumstances. In the cases of a number of circuits in parallel the total admittance of the complete circuit is evidently the sum of the admittances of the component circuits, whereas the total impedance is the reciprocal of the sum of the reciprocals of the impedances of the component circuits. The former operation is manifestly the more practicable of the two in the majority of cases.

Conversely, in the case of a number of series circuits the total admittance is the reciprocal of the sum of the reciprocals of the admittances of the component circuits, whereas the total impedance is the sum of the impedances of the component circuits.

Related Circuit Constants.

Thus, in dealing with parallel circuits it is better to employ the impedance equation. Finally, it is instructive to note the relation between the various circuit constants which have now been established.

Since we have seen that $Y=Z^{-1}$, it follows that $YZ=1$ and therefore $(g^2+b^2)(r^2+x^2)=1$. From these relations the admittance may be calculated from the impedance, and the conductance and susceptance from the resistance and reactance. In this connection it should be noted that when $x=0$, $r+jx=r$, and $g=\frac{1}{r}$. This relation therefore applies only to a non-inductive circuit or a direct current circuit.

The deduction of the usual formulæ expressing the conductance and susceptance in terms of the resistance and reactance, and the resistance and reactance in terms of the conductance and susceptance tends to preclude the possibility of confusion in appreciating the significance of these terms, and seems therefore to be warranted in the present instance.

Since the admittance is the reciprocal of the impedance $r+jx$, we must write $\mathbf{Y}=g-jb=(r+jx)^{-1}$ which gives, on multiplication by $r-jx$,

$$g-jb=\frac{r-jx}{(r-jx)(r+jx)}=\frac{r-jx}{r^2+x^2}$$

whence

$$g-jb=\frac{r}{r^2+x^2}-j\frac{x}{r^2+x^2}, \text{ or } \frac{r}{Z^2}-j\frac{x}{Z^2},$$

from which we obtain

$$g=\frac{r}{Z^2}=\frac{r}{r^2+x^2}, \quad b=\frac{x}{Z^2}=\frac{x}{r^2+x^2},$$
$$r=\frac{g}{y^2}=\frac{g}{g^2+b^2}, \quad x=\frac{b}{y^2}=\frac{b}{g^2+b^2}.$$

These are the forms in which the various circuit constants are expressed in the majority of electrical text-books. It is probably unnecessary to remark upon the advantages which result from the applications of such methods of calculation, which have in many cases greatly simplified the solution of such complicated circuit arrangements as are frequently encountered in modern practice. In spite of the evident analytical value of the theory the space devoted to its elucidation in the standard text-books is very small.

For the successful practical application of the theory in a general way to the theory of alternating currents it must necessarily be extensible to alternating wave theory. Such applications of the theory result in certain practical advantages which we proceed to demonstrate.

From Fourier's theorem in harmonic analysis we know that the alternating current waves encountered in practice are expressible in the form

$$A=A_1\cos(\theta-\alpha_1)+A_3\cos(\theta-\alpha_3)+\ldots A_{2n-1}\cos(\theta-\alpha_{2n-1}).$$

Each term of the right-hand member of this equation represents a pure alternating wave of the form $A=A_x\cos(\theta-\alpha_x)$ and may therefore be represented by the alternative vectorial expression

$$\mathbf{A}=a_1+ja_2=a(\cos\theta+j\sin\theta)$$

The expression for the complete wave may therefore be resolved into a series of complex expressions of different modulus and argument, each of the component expressions being amenable to the general theory of complex quantities, and the whole wave consequently expressible in the complex

Digitized by Google

form. In the usual notation we may write for the alternating current wave

$$i = I_1 \sin(\omega t - \alpha_1) + I_3 \sin(3\omega t - \alpha_3) + \ldots$$
$$= I_1 (\cos\theta_1 - j \sin\theta_1) + I_3 (\cos\theta_3 + j \sin\theta_3) + \ldots$$
$$= (i_1 - j i_{11}) + (i_3 - j i_{33}) + (i_5 - i_{55}) + \ldots$$

which expression may be put in the form

$$\mathbf{I} = \Sigma_1^{2n-1} (i_n - j i_{nn}).$$

The suffixes of the terms in these expressions serve to indicate the different frequencies of the component waves or vectors.

The extension of the foregoing principles follows naturally from these equations, which also exhibit the advantages which are obtainable by the adoption of complex methods in alternating wave theory.

Other Applications.

Considerations of space prevent us from pursuing the applications of the theory to their logical conclusion. It must suffice to remark that electrical theory, although offering many suitable problems, is by no means the only science of applied mathematics offering scope for the application of complex methods. The fundamental equation connecting spatial and temporal measurements in the theory of relativity makes use of the imaginary operator, which is also used in the Lorentz transformations connected with the theory, and in relativistic mechanics. There are also many of the more advanced branches of ordinary mechanics which make use of this conception. In practically every branch of advanced analysis where the higher mathematical theorems are employed we find ample scope for the application of complex methods of representation, which in some cases considerably shorten and simplify the mathematical operations, and in other cases render the problems amenable to analysis. Two very important branches of applied mathematics may be cited as instances of these conditions. In the theory of conjugate functions, leading to problems in two dimensions and ultimately to the theory of Riemannian potentials, the operations are based upon the conception of complex quantities. This also applies to the theory of wave propagation in its application to the electromagnetic theory of light.

In conclusion, we venture to express the hope that before long the methods of analysis forming the subject of the present slight treatment may reach a condition of more extended application, thereby extending to modern theory the unpremeditated but none the less real advantages resulting from the researches of the early mathematicians.

BOOK REVIEWS.

"Heaviside's Electrical Circuit Theory." By LOUIS COHEN. (London: McGraw-Hill Publishing Co.) Pp. ix+169, with 27 figures. 12s. 6d. net.

Since his death a few years ago, the scientific world has slowly awakened to a true appreciation of Heaviside's contributions to electrical theory, but unfortunately his own works have remained inaccessible to the majority of electrical engineers, owing partly to their apparent discontinuity and vagueness, and partly to the unusual nature of the mathematical processes employed.

The book under review represents a very praiseworthy attempt to remedy this state of affairs by putting before the electrical engineer a simple explanation of the principles of Heaviside's operational calculus as applied to circuit theory.

Stated briefly, Heaviside developed a new method of solving the differential equations which arose in connection with telephone line and cable problems, and by means of his celebrated Expansion Theorem, he obtained directly the complete solution for voltage or current distribution in the circuit for both the steady and transient states. In the present work, the application of the Expansion Theorem is shown to the solution of such problems as filter circuits, transmission lines, and artificial telephone lines, as well as to the problems orginally studied by Heaviside.

After a short introduction by Prof. Pupin, Chapter I develops, in a clear systematic way, the theory of the operational calculus, and illustrates its use by simple problems involving circuits with concentrated resistance, inductance and capacity.

The Expansion Theorem, the nucleus of Heaviside's theory, is derived in a comparatively simple manner in Chapter II, and it is shown to be applicable to all kinds of circuits, including those with distributed electrical constants. Examples are considered for both d.c. and a.c. voltage disturbances applied to simple circuits containing concentrated inductance and capacity, to divided circuits, and to coupled inductive and oscillatory circuits.

In Chapter III is considered in some detail the solution of problems of electric filter circuits, these comprising recurrent sections of constant capacity and inductance in various combinations. Low pass filter circuits with inductive series elements, and high pass filter circuits with capacity series elements are dealt with, and also magnetically coupled filter circuits. The resonance effects of multiperiodic circuit systems are discussed.

Chapter IV on "Ocean Cables," deals principally with circuits of distributed capacity and resistance, this being one of the main subjects of Heaviside's original investigations. The chief result required is generally the current at the receiving end due to a given disturbance at the sending end. The effect of terminal impedances, and the resulting incomplete reflections, on the characteristic of the cable is considered.

In Chapter V on "Transmission Lines," the more general problem of circuits with distributed inductance and leakance, as well as resistance and capacity, are considered. Mention is here made of the "distortionless" line. Cases taken include a finite line open and grounded at the ends, and also with terminal impedances.

Chapter VI is devoted to a study of artificial lines which are of practical importance in connection with their use for balancing telephone lines or ocean telegraphs for duplexing or other purposes, and also in connection with the study of phenomena on long transmission lines.

The final chapter gives a brief historical survey of the manner in which Heaviside was led to develop his expansion formula. This is useful in that it emphasises the much greater simplicity of Cohen's treatment from the point of view of the practical engineer.

Some notes on Bessel functions and a collection of mathematical formulæ used in the book are given in an appendix.

The whole book is well produced, the mathematical parts in particular being clearly set out and easy to follow.

R. T. C.

Die Asynchronen Drehstrommaschinen mit und ohne Stromwender. By FRANZ SALLINGER. (Berlin: Julius Springer.) Pp. 197+vi. RM. 8; bound, RM. 9·20.

The author of this excellent little book is the Professor at the Esslingen Engineering School, and the work is for the express purpose of widening the scope of lectures to his students. The hope is expressed in the preface, however, that the book will make a wider appeal to practical engineers as well as students. A good groundwork in the technology of alternating currents is presupposed. The subject is tackled in a pleasingly logical way, sections on windings, induced e.m.f., the rotating field, leakage, etc., receiving clear and concise treatment, after which, in Part II, the induction motor is considered. No attempt is here made to get very closely to the fundamental verities, the rotating field and the transformer induced e.m.f. equations being used in the well-known manner to find the rotor current, electrical and mechanical rotor powers, and the torque. A consideration of the Heyland diagram is amplified by an investigation of no-load and short-circuit conditions, after which a section on the induction generator concludes the simpler theory of the machine. A good deal of space is devoted to the "exact" circle diagram with its torque-power, power-factor slip and efficiency lines. It appears to be the fashion in German books to obtain as much information from, and to put as many lines in, the circle diagram as possible, without much regard as to the suitability of such lines for the purpose intended. This applies more especially to the slip and efficiency lines. Speed regulation receives considerable attention, many systems such as the Krämer being described, together with variable-speed sets utilising rotary converters, frequency changers, etc. Part III deals with the a.c. commutator machines. The influence of Arnold's "Wechselstromtechnik" is here considerable. This is no fault, for the author does not pretend to a presentation of anything new, but draws freely on the best authorities. The treatment of the commutator machines is largely descriptive. A number of variable speed sets utilising commutator machines as auxiliaries to main induction motors are described to close the book. The field covered by this work is already very well exploited by both British and American writers, but those who are familiar enough with the language and who are interested in a fresh and concise presentation of a subject will find this book of interest. The typography is of the standard that Springer has made famous.

UNTREATED FABRICS FOR ELECTRICAL PURPOSES.

Special Needs of the Electrical Industry and the Characteristics of Some Materials Available—Increasing Use of Fine Silks and Asbestos Tapes.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

WHILE fabrics and tapes are of considerable importance in insulating processes the amount of these materials required for such work is so small compared with the quantities required for other purposes that up to the present time few, if any, mills have specialised in the manufacture of materials suitable primarily for electrical purposes. Indeed, during the cotton boom period it was practically impossible to arouse any interest in this application among the producers of woven goods. More recently there has appeared a greater willingness to try to meet the special needs of the electrical industry, and it is well that these needs should be reviewed, and that the characteristics of the materials which are available, and those which are desirable, should be appreciated.

Some progress has been made, in that most of the large electrical users have detailed their requirements by the issue of purchasing specifications and have installed special apparatus for testing the materials. In most cases, however, the actual selection involves a careful and costly examination of large numbers of samples submitted, apparently in the hope of some one or other having approximately the characteristics required. In this respect, as well as in the development of new materials, much benefit should result from the greater co-operation which now seems possible between the makers and the electrical users.

Fabrics are used in the electrical industry either in their natural state or impregnated with resins, gums or other materials. As indicated by the title, this article deals mainly with fabrics for use in their untreated state, treated materials being mentioned only for purposes of correlation and comparison.

Electrical Strength of Fabrics.

So far as untreated materials are concerned, the electrical strength of fabrics is not such as to render them of any real value as insulators. Their porous nature results in the breakdown values being, at their best, practically the equivalent of those of the same distances in air. Ordinarily the electrical strength of fabrics is rather less, owing to the presence of moisture in the material. Further, even though insulating properties of practical value may be obtained under perfectly dry conditions, this state of affairs cannot be permanently maintained owing to the great affinity for moisture characterising the whole range of fabric materials at present available.

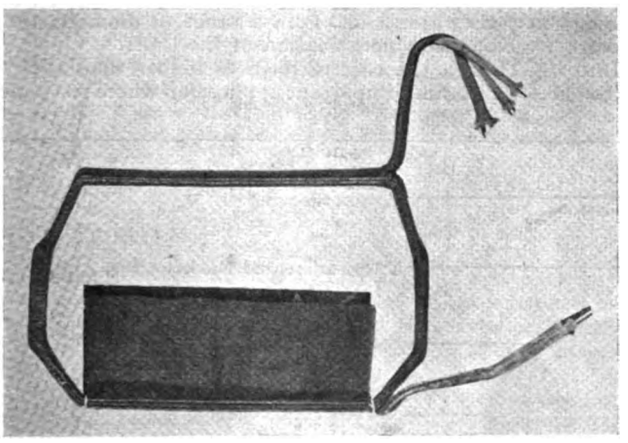

Fig. 1.—Partly insulated coil showing use of cambric-mica cell material and binding tape on slot portion and cotton sleeving on leads.

Good electrical strength can be obtained with fabrics only when all the interstices of the material are completely filled with varnishes or gums of good insulating properties. In such cases the fabric may be considered to act as a carrier or mechanical reinforcement rather than as an actual insulator. The impregnation of fabrics for electrical purposes may be carried out either before their application, or afterwards. In the latter case it may be noted that a stronger and closer binding is obtained. Untreated materials wrap more tightly than those which have been previously impregnated. The tightness of wrap is further increased by the shrinkage which takes place in the impregnation process, and the mechanical strength is improved by the sealing together of the layers.

The selection of untreated fabrics is thus influenced to a much greater extent by considerations of mechanical strength than by that of electrical strength. A further consideration is also of great importance, however, namely that of space. Manufacturers of fabrics have, up to the present, failed completely to realise the importance of this consideration with regard to electrical applications, probably because it does not apply to anything like the same extent in connection with the materials they supply for other uses.

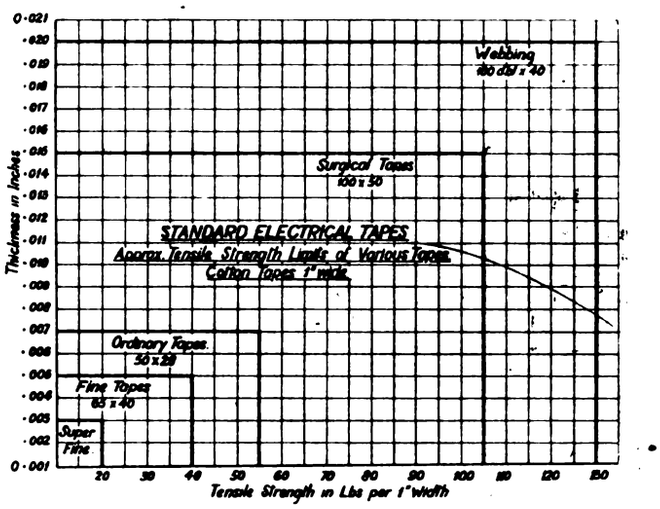

Fig. 2.—Tensile strength limits of suggested standard electrical tapes.

In electrical apparatus increasing efficiency has demanded the use of finer and finer materials, and for this reason an extended use has been made of fine silks, in spite of their cost being higher than that of cotton goods. A great deal of silk is now commonly used in the insulation of slot portions of coils for motors and generators, in which application the space factor has probably its greatest importance.

The Ideal Fabric.

From the designer's point of view the ideal fabric would have minimum thickness, absolute uniformity, sufficient mechanical strength to ensure tight and clinging application, and good ageing properties, even at high temperatures. In the absence of the ideal, the various considerations have led to the use of available materials somewhat as follows:—Silk—where space requirements predominate; superfine cotton—where space is important but price consideration predominates; cambric—where good mechanical properties are of more importance than electrical features; linen—where resistance to abrasion is required; canvas—almost entirely for mechanical properties under normal temperature conditions; asbestos—to ensure maintained mechanical properties at high temperatures.

SILK.—Fine silk tapes are used for binding purposes for such work as finishing off instrument coils, leads, etc. An even finer grade of silk or chiffon is used in the manufacture of composite tapes, ribbons and sheets, in which thin selected mica splittings are bonded to form flexible wraps, the silk being used as mechanical reinforcement. High grade silk is also used in varnish treated form, produced by selected material being run thrugh a suitable varnish and dried in heated towers. The characteristics of the different varieties of silk used for these purposes are approximately as follows:—

	Thickness (inch).	Warp × Weft (Threads per inch)	Tensile strength (Lb. per inch width.)
Silk tapes ..	0·0035—0·004	100 × 80	16
Baking silk ..	0·0015—0·002	130 × 110	12–15
Varnish silk ..	0·0025—0·003	90 × 90	12

Digitized by Google

SUPERFINE COTTON.—Many attempts have been made to produce superfine cotton fabrics to compete with the Jap silks used for baking mica sheets, and cotton materials have actually been made with a thickness of 2 mils, but their mechanical strengths are slightly inferior to those of silks.

The finest actual commercial lengths that have been made in this country were obtained from fine Egyptian cotton,

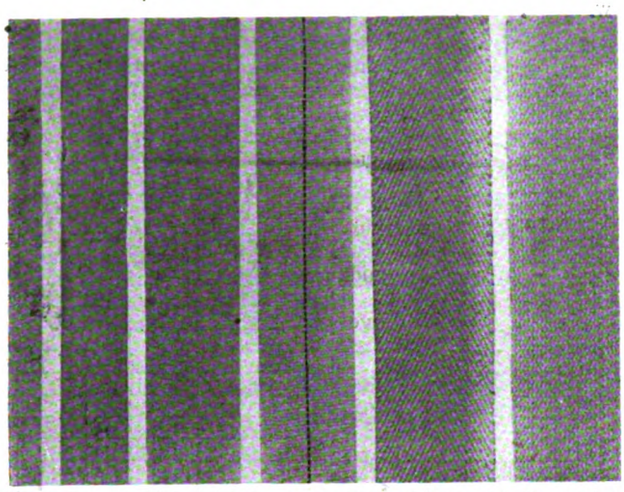

Fig. 3.—Tapes used for electrical purposes, showing (left to right) silk, superfine cotton, fine cotton, ordinary cotton, and surgical cotton tapes and webbing.

and were produced in 1925 by the joint co-operation of Messrs. William Heaton and Sons, the Metropolitan-Vickers Research Department, and the British Cotton Research Association. This resulted in the production of a fabric with the following characteristics :

Thickness (inch).	Warp × Weft (Threads per inch).	Tensile Strength (lbs. per inch width).
0·0022	116 × 110	10·5—11·2

There was at that time every likelihood of this material actually replacing Jap silk, but activities in this direction were brought to a standstill, following a big reduction in the price of silk, and, since the reduced price of silk has held, no further developments in this direction have been made. The results of the work may well be of practical value, however, should the economic position change at some future date.

The chief application of superfine cotton is chiefly as a tape where neatness and space are important factors and where a thickness of 3 mils is permissible. The characteristics of the material as commonly used are shown below.

	Thickness (inch).	Width (inch).	Warp × Weft (Threads per inch).	Tensile Strength (lbs. per inch width).
Superfine ..	0·003	$\frac{3}{8}$	92 × 60	34·2
Cotton Tapes	0·003	$\frac{3}{4}$	88 × 60	40·5

CAMBRIC.—This is a thin, straight-woven cotton cloth. For electrical uses the colour is not important, and the material is therefore ordinarily used in its unbleached state. Its principal use is as a reinforcement for mica cells for the slot portions of coils. Fig. 1 shows a coil in process of insulation, one half having the mica cambric cell material in position ready for wrapping, and the other half showing the cell completed, and bound in position by a layer of superfine cotton tape.

A suitable material is generally rather open in weave, with characteristics approximately as follows :—

	Thickness (inch).	Warp × Weft (Threads per inch).	Tensile Strength (lbs. per inch width).
Cambric ..	0·003—0·004	85 × 60	16 (warp direction). 9 (weft direction).

Suggested Standards.

SILK AND COTTON TAPES.—Owing to the non-existence of any standard terminology, various tapes have been called by different names, and it is somewhat difficult to obtain required tapes without choosing from a variety of samples, but there appears to be a growing tendency to recognise the types shown in the following table for the uses indicated.

Suggested Name.	Thickness.	Trade Names.	Chief Uses.
Silk Tapes	0·002	Silk Ribbons	Fine taping of instrument coils.
Superfine Cotton	0·003	Egyptian Cotton	Small coils, solenoids, leads, etc.
Fine Cotton	0·005	"Linen-finished" Egyptian, etc.	Medium sized armature and field coils.
Ordinary Cotton	0·007	"American" Standard	End windings of large coils.
Surgical	0·015	Herring-bone, etc.	Tight taping of field coils, etc., to improve rigidity.

The approximate tensile strengths are indicated in Fig. 2, together with the usual limiting thickness, whilst the appearance of the tapes can be judged from Fig. 3, which shows the more pronounced features of the webbings, the straight line weave of the superfine, fine and ordinary tapes, and the "herringbone" or star pattern of the "surgical" tapes.

A recommended special feature of electrical tapes is the existence of a coloured thread running down the centre of the tape, as shown in one of the specimens in Fig. 3. Such a line facilitates accurate taping operation where tapes have to be applied with overlaps of $\frac{3}{8}$ or $\frac{5}{8}$ of the tape width.

COTTON SLEEVING.—Extensive use is made of cotton sleeving material for additional insulation on the leads of coils, as, for instance, on the close-packed conductors between the slot portion and the armature of d.c. machines. The sleeving materials are available in a range of diameters and in various colours for identification of the leads.

LINEN.—Though the cost of linen is higher than that of cotton materials it finds important application where resistance

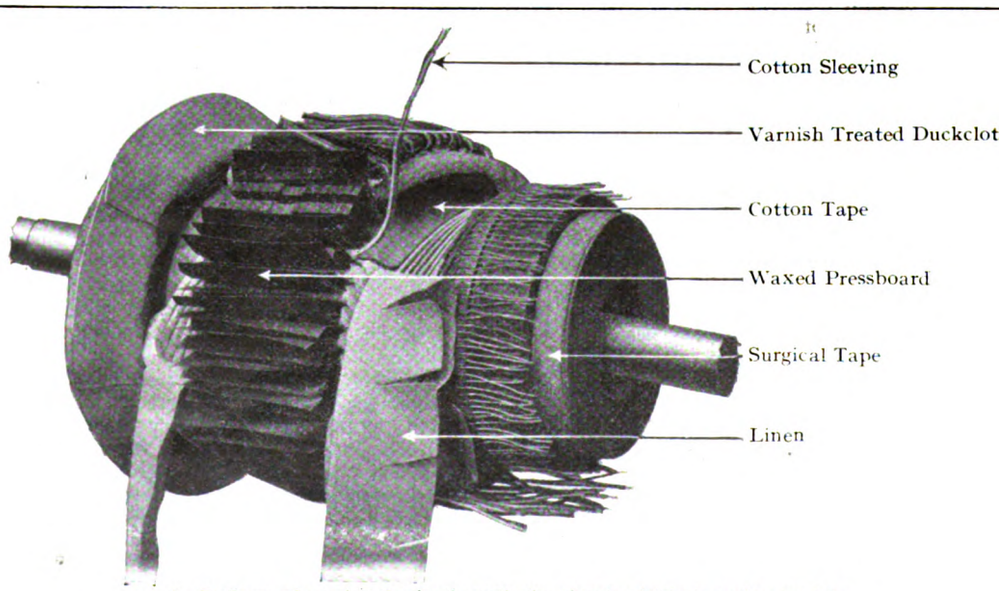

Fig. 4.—Partly wound armature showing the application of various fabrics in machine insulation.

Digitized by Google

to abrasion is required, as, for instance, for reinforcing the insulation between cross turns of armature coils. The material used for such work is a strong unbleached straight-woven cloth with characteristics approximately as follows :—

	Thickness (inch).	Warp × Weft (Threads per inch).	Tensile Strength (lbs. per inch width).
Linen..	0·001—0·015	60 × 44	100 (in any direction).

Fig. 4, which shows a partly-wound armature, illustrates the use of linen as mentioned above, and also the application of other fabrics in machine insulation.

CANVAS AND DUCKCLOTH.—These heavy cloths are used for the protection of the end windings of machines. One of the essential features of the materials is good mechanical strength even after prolonged service at high temperatures. To check this property it is often a practice to subject samples to a temperature as high as 180 deg. C. for several hours, after which it should still be capable of being bent flat on itself without cracking.

Canvas materials should be woven from Egyptian cotton, and in general conform to the following details :—

	Thickness (inch).	Warp × Weft. (Threads per inch).	Tensile Strength (lbs. per inch width). Warp.	Weft.
Canvas or Duckcloth	0·020	44 × 40	100	50
	0·035	24 × 24	130	120

Where this class of material is required for the production of synthetic resin canvas boards, a material with a more open texture is generally employed, as this allows better adhesion between laminæ through the interlocking of the interstices under the pressure to which it is subjected. In this case the range of thickness varies between 15 mils and 25 mils.

ASBESTOS FABRICS AND TAPES.—With the refinements which have been introduced during the last few years in the art of weaving asbestos, a growing demand for this material is evident. Originally its chief use was in the manufacture of synthetic resin asbestos boards, but it is quite common now to find it fulfilling a much more important function, chiefly in the form of the superfine asbestos tapes for insulating heavy duty field coils and the individual conductors of coils for large turbo-alternators.

The advance in the use of this material is due to improved uniformity and reduced thickness, combined with reduced cotton content and good mechanical strength. A superfine asbestos tape of 0·007 in. thickness is now being sought for, but in the meantime excellent results are being obtained with a 10 mil tape which gives a tensile strength of approximately 20 lbs. per in. width.

The authors' acknowledgments are due to the Metropolitan-Vickers Electrical Co. for the use of information and photographs.

ELECTRICAL INSULATING PAPERS FOR THE MANUFACTURE OF POWER CABLES.*

Impregnated Paper the only Practical Dielectric for High Voltages—Physical and Electrical Characteristics of Paper—Need for Research on Properties of Fibres.

By T. N. RILEY, D.S.C., M.Sc., M.I.E.E., and T. R. SCOTT, D.F.C., B.Sc., A.M.I.E.E.

IF an engineer were asked to choose a cable dielectric, without regard to existing knowledge on the subject, it is not probable that he would place paper first in his choice of materials for investigation. It is hygroscopic and has to be covered by an impermeable outer sheath; it has to be put on in layers in order to attain flexibility, and its electrical characteristics are not the same along and across the layers; the gas spaces between the fibres must be replaced by oil or similar material which is less liable to break down.

Up to the present, however, no solid flexible material of equally good dielectric qualities and equally low cost has been evolved; and impregnated paper, therefore, remains the only practical dielectric for high-voltage cable work. This is partly owing to the large amount of experimental work which has been carried out, in conjunction, by paper makers and cable makers, in order to overcome the natural disadvantages of the material and improve its quality as electrical requirements have been made more severe.

All the earlier authors based the main distinction between papers on the fibre stock from which they were made. More recently it has been realised that the very considerable differences in the physical structures of papers made from the same fibre stock have an important bearing on their suitability for insulating purposes. Before attempting to estimate the relative importance of these two points of view it is desirable to consider what is actually required of the paper.

It is proposed to discuss mainly the physical and electrical characteristics of paper. Although little or no reference is made to the chemical characteristics (i.e., freedom from acidity and alkalinity, low ash content, freedom from resinous and nitrogenous material, etc.), the authors do not wish it to be inferred that these qualities are of no importance for cables. They have not been referred to because such requirements for cable paper do not differ essentially from those for paper for other insulating purposes, and these requirements, and the methods of test for them, have already been adequately dealt with in previous publications.

Since the paper must be applied in layers to secure flexibility, it must have sufficient mechanical strength, both along and across the machine direction of the sheet, to permit of the core being wrapped without undue breakage of paper, and to permit of the cable being bent in service without cracking the paper tapes. As it is possible to obtain the necessary mechanical strength with a number of different types of paper, this characteristic cannot be made the primary controlling factor in deciding on the type of structure to be used.

The paper fibres always contain moisture colloidally linked with the cellulose as part of the structure. In the air-conditioned state they also contain a large percentage of free moisture. The "combined" moisture cannot be removed without physical damage to the paper. Manufacture of the paper must be so carried out that the "combined" moisture is kept to a minimum, and the electrical conductivity can be reduced to the lowest possible value by the removal of the whole of the free moisture.

The structure must also be such as to facilitate the removal and replacement by oil of all the gas content, both in the pores of the fibres and between them.

It is impracticable to discuss electric strength as a function of the paper alone; but obviously the structure must be such as to result in the highest possible electric strength in combination with the impregnating compound in the finished cable. It has already been stated that the conductivity of the dielectric is reduced by the removal of the free moisture; but the conductivity of the fibre itself should also be as low as possible, in order to minimise dielectric losses in service.

The paper must also have good ageing qualities, so that there will be no deterioration of the electrical or physical characteristics with time.

Some of these requirements are conflicting, and improvements in one direction can be obtained only at the expense of losses in others. It is, therefore, necessary for the cable maker to determine which compromise he will adopt in order to obtain the best results from the finished cable in service.

High electric strength is obviously a requirement in which little concession can be made, and it is, therefore, proposed to discuss first the features which secure this.

High breakdown voltage may be dependent on the impregnating compound, on the paper, or on the two in conjunction. Its exact value will also depend on the temperature of the sample and on the rate of duration of application of the voltage. The mechanism of failure may also vary with variation of these conditions, but this is still imperfectly understood.

Dry paper alone makes a very satisfactory dielectric for low voltage work and is in universal use for telephone cables, for example. At high pressures, breakdowns occur in the air spaces between the fibres, leading to charring and ultimate failure. One point of view, therefore, is that in power cables the compound is added to prevent breakdown of the air spaces in the paper, which is the main dielectric.

The greatest gain in electric strength is to be obtained by reducing the surface leakage, first by removing every trace of surface moisture, and, second, by increasing the strength of the leakage path. In order to effect improvements in this

* Extracts from a paper read before the Institution of Electrical Engineers.

Digitized by Google

respect, some means of comparing different papers quantitatively must be devised. For the usual cable-paper structures, any increase of strength of the interfibrous channels will also increase their resistance to the flow of air.

The type of structure which appears to give the highest breakdown strength is also that which the lowest power factor is most easily obtained and which gives the highest thermal conductivity.

Forthcoming Improvements.

There is little doubt that the main development of cable-paper types to be expected in the immediate future is that of obtaining increased capillarity and rate of oil absorption without loss of other desired characteristics; and the values exhibited from time to time by paper samples suggest that great improvements along these lines are possible, once the desired control has been obtained.

In general, it may be said that calendering or hydration, which tend to close up the surface of the paper, also tend to increase the time required for penetration, although judicious calendering may not exert a great influence. Calendering appears to affect both surfaces of the paper, though not to the same extent.

There is distinct evidence that, although in all conditions in which paper is in practical use as an insulator it is nominally in a dry state, its electrical conductivity and electrostatic capacity are still modified by the presence of moisture; and that the variation of moisture content leading to irregular electrical tests is intimately connected with the structure of the paper.

During manufacture, paper comes in contact with many times its own weight of water, and the purity of the water in respect of dissolved salts must affect the purity of the paper. The adsorptive properties of the colloidal cellulose for electrolytic salts must, therefore, be taken into account, and there is little doubt that conductivity values are considerably affected. The amount of such impurities is indicated by the ash content.

Mechanical strength is a secondary consideration in selecting a type of structure, since in most cases it is comparatively simple to obtain sufficiently high values to meet the various stresses encountered in manufacture, laying, and service. Similarly, ageing is a characteristic which should be considered only after the initial requirements have been obtained. It does not appear to be reasonable to build up a structure capable of retaining its qualities for many years if the structure itself is unsuitable and likely to induce breakdown at an early stage in the life of the cable.

Paper is applied to the cable in an air-dry condition, and the strength values necessary can, therefore, be determined empirically by comparison of performance on the machine with standard air-dry tests. The stresses encountered in lapping, laying-up, and reeling a cable are a mixture of tensile tearing and bursting stresses. Fortunately they can, on the whole, be judged fairly accurately by the tensile strength in the longitudinal (or machine) direction and by the strength in the cross direction. It is generally found that where high values of longitudinal tensile strength are obtained at the expense of the strength in the cross direction—i.e., by lining up the fibres in the machine direction, the value of tearing strength in the longitudinal direction is greatly reduced. A sufficiently high tensile strength in the cross direction (say, not less than 50 per cent. of the value in the longitudinal direction) must therefore be specified in addition.

During drying and impregnation the cable is not subjected to mechanical stresses, and the characteristics of the paper subsequent to the latter process are next of interest. In general, a loss in strength is to be expected, although there are a few exceptions. It is sometimes of interest to trace whether this loss of strength is due to the drying process or to the impregnation process, and the standard E.R.A. ageing test provides a simple means. There is, in general, a slight increase of bursting strength during drying.

The ageing quality is not solely dependent on the original fibre, but is affected, for example, by the amount of heating, and therefore the amount of hydration of the cellulose by the chemical impurity remaining as a result of imperfect washing or impure washing water, and also by the conditions under which the paper is to be used. It is, therefore, unsafe to draw conclusions except from the particular paper in question tested under the actual conditions in which it is to be used.

In one respect there is room for decided immediate improvement of supplies—namely, with regard to uniformity. While admitting the difficulty of controlling paper making processes to a fine degree, it would seem that some improvement should be possible.

The former practice of specifying Manila paper for power cables is not justifiable at the present day. Satisfactory behaviour depends more on the chemical cleanliness of the materials and processes, and on the physical formation of the paper, than on the fibre base. Freedom from acidity or alkalinity, low ash content, and freedom from sizing and loading materials, are essential if the electrical qualities desired are to be obtained, and, in discussing the physical results of the manufacturing process, it has been assumed that all possible precautions to meet chemical requirements have already been taken.

If the various physical attributes of the paper be considered together, it is evident that for impregnated papers a strong case can be made out, on the basis of standard tests, for the type which exhibits low bulk combined with high oil absorbency. The low bulk should be obtained by packing of fibres, with judicious use, to a strictly limited extent, of hydration and calendering. Heavy surface calendering is undesirable. A paper made up of chemical wood-pulp appears to give all-round satisfactory characteristics, but, apart from the question of adaptability to structural requirements, there appears to be no reason why other types of fibres should not be employed. It is not suggested that the optimum compromise has been reached—in fact there are indications that further development is possible, and the outlook for cable-insulating papers of the future appears to be distinctly promising.

In order that further progress may be made, there appears to be a need for more fundamental research on the properties of the individual fibre. In the textile industry much valuable information has been gained on the physical structure and characteristics of textile fibres. Very little has been done from this standpoint as regards the fibres used for paper making. It is a field suited to the independent investigator or research association, rather than to the factory research-laboratory, and it is suggested that such work would greatly accelerate the development of better materials.

There is also need on the paper makers' part for the development of methods of treatment in which the electrolytic impurities absorbed by paper during the manufacturing process can be reduced, and by which the required dense structure can be attained without undue calendering and with greater uniformity.

TESTING OF HYDRAULIC TURBINES.

THE new British Standard Specification for the Testing of Hydraulic Turbines is the latest addition to the list of British Standard Specifications for Prime Movers, which series includes specifications for steam turbines, reciprocating steam engines, and various types of internal-combustion engines.

The latest specification differs from the previous members of the series, however, in the fact that it relates entirely to the testing of the machine, and does not deal with the performance except insofar as the conduct of the test is concerned.

The following points are dealt with in the specification:—Conditions of head, speed and output for acceptance test; condition of turbine during test; speed variation; power output of turbine; measurement of net or effective head of reaction turbine, Pelton wheel or impulse turbine; errors in measurement; efficiency; measurement of rate of flow. An appendix deals with the information to be given with the inquiry or order.

It is of interest to record that this specification is based on, and is, to all intents and purposes, identical with the International Rules for the Testing of Hydraulic Turbines, published by the International Electrotechnical Commission. Copies of the Specification (No. 353–1929) may be obtained from the British Engineering Standards Association, Publications Department, 28, Victoria Street, London, S.W.1, price 2s. 2d. post free.

A BIG CONDENSER.

What is claimed to be the largest steam condenser in the world is now being assembled at the East River generating station of the New York Edison Co. Nearly 700 tons of steam an hour will be condensed by this unit, and there will be 90 000 sq. ft. of cooling surface. Water for condensing will be supplied by two 54 in. centrifugal pumps, with a capacity of 160 000 gallons of water per minute.

THE PREVENTION OF IONISATION IN IMPREGNATED PAPER DIELECTRICS.*

Research on Reasons for Failure—Absolute Potential the Deciding Factor—Protective Effect of Guard Strips—A Suggested Test.

By S. G. BROWN, F.R.S., M.I.E.E., and P. A. SPORING, M.Sc., A.I.C.

IT is known that the performance of paper-dielectric condensers which in this country are generally used on 600 V a.c. circuits, has not been entirely satisfactory. The experience of the manufacturers of such condensers has been that a number of failures occur after a period of service varying from one to two years, and that in each case the symptoms have been very similar. The failures have taken place notwithstanding most severe tests before installation; and there appears to be no relation between any test which can be applied before installation and the length of life in service. These results are very similar to those obtained on high-tension cables which have failed in the same way.

In recent years much research has been carried out to discover the reason for the frequent failure of impregnated paper dielectrics which have been subjected to alternating potentials for considerable periods.

In the cable industry particularly, the effect of the presence of air bubbles upon the dielectric properties of high-tension cables has been investigated at length, and, while it cannot be said that opinion is unanimous as to what part ionisation plays in dielectric breakdown, there is a large amount of evidence which ascribes a preponderating influence to this effect, as is shown by the various methods which have been developed for reducing the amount of ionisation or of evading its consequences by replacement of air by a more inert gas.

It has been found that if the power factor of, for example, a high-tension cable is measured at increasing values of voltage, the measured losses increase rapidly when a certain voltage is exceeded. This potential has been referred to as the "critical" or "ionisation" voltage, and it has been tacitly assumed that as long as the cable is working below this voltage, ionisation of the enclosed air cannot take place. This assumption is not quite correct. If the dielectric contains but little occluded air, then, since the proportion of air to the remainder of the dielectric is very low, the losses in the air must rise to a very great value before they can be detected by the measuring instruments, which automatically read an average power factor over the whole of the dielectric. The true ionisation voltage may be exceded many times before any increase in the power factor can, with certainty, be detected.

False Security.

A straight-line power factor voltage curve does not mean that ionisation is not taking place, and it may in fact give an altogether false sense of security. To reduce the quantity of air in the dielectric to an amount so small that the increased losses due to ionisation cannot be read on the measuring instruments is of doubtful utility, since the tendency of the dielectric in service will be to increase the proportion of ionisation loss; and it appears that to obtain an accurate idea of the behaviour of a dielectric in which air is present, it is preferable to study that dielectric with as large an amount of entrapped air as possible (in order that the effect of the ionisation of the air may not be masked by the large amount of other dielectric present) and then to see whether it is possible to discover some method of completely preventing ionisation.

The first point to be considered is the effect of ionisation of entrapped air upon the electrical properties of the dielectric. It is considered probable that breakdown is largely due to secondary chemical reactions set up by the ionisation, ozone and nitrous oxides being produced and leading finally to the destruction of the dielectric.

As a measure of the chemical state of the dielectric a knowledge of the insulation resistance is invaluable, as this enables one to study the effect of prolonged ionisation by placing a condenser on an alternating potential greater than that required to start ionisation, and measuring the insulation resistance and power factor at intervals.

It appears that if the dielectric contains air it is not possible to prevent ionisation by increasing the dielectric thickness except to a prohibitive extent. In other words, the absolute potential, rather than the potential gradient, is the deciding factor. It is quite possible to have two condensers with identical potential gradients, one in a most unsatisfactory condition and one working quite well.

It is true that any particular potential difference across a definite distance can be expressed as an average potential gradient, but no real advantage is gained. It is quite impossible to tell from the potential gradient alone whether the dielectric will eventually fail; but it is suggested that, from a knowledge of the absolute potential, this is possible.

The principle on which design is to be based is that ionisation of entrapped air is impossible unless the voltage applied to the electrodes exceeds the minimum sparking potential, which in air at atmospheric pressure is about 300 V.

The correct method, then, of building a dielectric to work at a given voltage is not to increase the thickness so that ionisation is prevented by this means, since economic considerations render this practically impossible; but rather to arrange that the dielectric consists of such a number of series sections that the voltage across any one section shall not exceed that required for ionisation.

The Limiting Thickness.

The limiting thickness which may be used for one section will be determined by the puncturing voltage of the thin layers used. The permissible potential gradient will increase indefinitely as the thickness of the dielectric decreases the voltage remaining constant at 300 V. Thus the final thickness used will be a compromise.

A remarkable confirmation of the protective effect produced by inserting the guard strip was obtained during tests of condensers. After working on 600 V and 50 frequency for some days, a number of condensers were found to have broken down, and on examination it was found that the guard strip did not cover the electrodes exactly, but left a narrow strip of unguarded condenser along one edge. It was this edge that had broken down. The remainder, which was covered by the guard, was quite sound.

The extension of this principle to cable manufacture is evident. If the dielectric be divided up into a large number of sections of equal capacity by layers of metal foil, or preferably by paper coated with a semi-conducting film, then by adjusting the number of sections the voltage applied to each can be kept below ionisation potential.

Consider the case of a cable with an air dielectric which is to work at 50 kV (R.M.S.). For simplicity it will be assumed that the centre conductor is of such a diameter that the problem can be considered to be that of two planes. The necessary thickness of air-gap to withstand this voltage will be 1 in., corresponding to a potential gradient of 50 V per mil (20 kV per cm).

If the dielectric be subdivided on a basis of 250 V per unit thickness, the thickness necessary to withstand 250 V at atmospheric pressure is approximately 0·2 mil. Thus to withstand 50 kV it is necessary to have 200 such sections in series, giving a total dielectric thickness of (200 by 0·2) = 40 mils, and an effective potential gradient of 1 250 V per mil (500 kV per cm).

The presence of solid dielectric will not materially affect these calculations. The tendency will be to exaggerate the defects in the plain unguarded cable, since the potential gradient will be greater across the air bubbles, owing to the low dielectric constant of air compared with that of the solid dielectric.

The methods of testing generally in use are not such as to give an indication of the behaviour of the dielectric under working conditions. The instantaneous breakdown voltage is of value in so far as it discloses actual mechanical defects in construction. On experimental lengths, power-factor/voltage curves, taken with the dielectric impregnated but not evacuated, give a reliable indication of the performance under working conditions.

Obviously, however, this test cannot be applied to any finished product. The test suggested for such a case is that a sample length of cable or condenser should be taken and placed in a vacuum, and its power-factor/voltage curve taken under these conditions.

THE SOLUTION OF PLAIN & AMALGAMATED ZINCS IN ELECTRIC BATTERIES.*

By J. NEWTON FRIEND, D.Sc., Ph.D., F.I.C.

An Investigation into the Possibility of Using High-Grade Instead of Amalgamated Commercial Zinc—No Change Recommended.

ABOUT a year ago a British firm inquired of the author (1) whether plain high-grade 99·9% zinc might be used to replace amalgamated ordinary commerical 98 to 99% zinc in electric batteries, and thus enable the expensive and somewhat dirty process of amalgamation to be dispensed with; or (2) failing this, if it would be more efficient to employ amalgamated pure zinc in such batteries. An investigation was therefore undertaken, and as the results may be of interest to others it has been decided to make them public.

TABLE I.

Series.	Corroding Medium.	Grade of Zinc.	Specimen No.	Rods or Cylinders.	Period of Exposure, Months.	Loss in Weight. Grm.	Mean Loss.	Remarks.
I.	10 per cent. H_2SO_4 in tank	OZA	27	Cylinders	3	7·58	5·56	All in good condition
			28			6·59		
			31			2·52		
		PZA	29			58·88	59·88	All eaten through
			30			54·67		
			32			66·08		
II.	Saturated ammonium chloride solution in tank	OZ	18	Cylinders	9	85·85	..	Pitted
		PZ	20			41·05	..	,,
		OZA	17			7·44	..	Fairly smooth
		PZA	19			11·50	..	,, ,,
III.	Saturated ammonium chloride solution in tank	OZ	10	Rods	9	5·83	5·84	Pitted
			16			5·85		
		PZ	12			4·02	4·24	,,
			15			4·45		
		OZA	9			2·52	2·62	Evenly attacked
			14			2·72		
		PZA	11			2·35	2·30	,, ,,
			13			2·25		
IV.	Saturated ammonium chloride solution in Leclanché cells used intermittently	OZ	2	Rods	9	7·13	9·61	Pitted
			6			12·09		Very deeply pitted
		PZ	2			9·05	8·77	Eaten away and roughened
			8			8·48		
		OZA	1			3·23	3·08	Fairly evenly attacked
			5			2·92		
		PZA	3			2·75	2·81	Fairly evenly attacked
			7			2·86		
V.	Saturated ammonium chloride solution in telephone cells used frequently	PZ	42	Rods	9	3·90	4·29	Roughened
			43			4·68		
		OZA	46			3·19	3·27	,,
			47			3·35		
		PZA	40			3·07	3·21	,,
			41			3·34		
		PZ	44			5·01	..	,,
		OZA	45			1·87	..	Least pitted in set

The zinc was provided by the London Zinc Mills, Ltd., and was in two forms:

(1) Sheet zinc, 0·35 cm. thick, bent round into a hollow cylinder 11·5 c.m long and 4·5 cm. in diam. It was fitted with a tongue, to which was riveted a thin copper strip for electrical connection, and this latter was coated with black varnish. Weight, approximately 350 grm.

(2) Cylindrical zinc rods, 15·3 cm. long and 0·96 cm. in diam. These were joined at the top to copper wire in the usual manner for Leclanché cells. Weight, approximately 85 grm.

Each of these forms was prepared in four varieties—namely, plain ordinary 98 to 99% zinc, "OZ"; ordinary zinc amalgamated, "OZA"; high-grade 99·9% pure zinc, "PZ"; and pure zinc amalgamated, "PZA."

The ordinary zinc had the following composition: Lead, 1·12; iron, 0·05; arsenic, 0·006 (approx.); zinc, 98·82%.

Dilute Sulphuric Acid Tests.

SERIES I.—In this series amalgamated cylinders alone were used, for the action of dilute acids upon various plain zincs had already been made the subject of extensive inquiry by numerous other workers. Preliminary tests showed that although the plain pure zinc was much more resistant to sulphuric acid attack than the ordinary metal, it was nevertheless attacked too vigorously to be of use in an electric cell. Thus, in 1 hr. a plain pure zinc cylinder lost 5·26 grm. in 10% sulphuric acid solution, whilst in the same period a cylinder of ordinary zinc lost 29·5 grm.

The results of exposing cylinders of the amalgamated metals to the action of dilute sulphuric acid for three months are given in the table. The cylinders stood upright on a glass plate in a large glass trough containing several litres of 10% sulphuric acid, and were immersed to a depth of 7·5 cm. The amalgamated pure zincs lost ten times as much in weight as the amalgamated ordinary zincs, and were eroded through in numerous places.

Ammonium Chloride Tests.

Although the effects of impurities on the corrosion of plain zincs by ammonium chloride solution have been investigated, notably by Drucker, published data concerning amalgamated zincs is very scanty. The following results, therefore, possess a special interest.

SERIES II. TESTS WITH CYLINDERS.—Four zinc cylinders were exposed in a large glass tank to the action of saturated ammonium chloride solution for nine months. They stood on a glass plate and were immersed to a depth of 11·8 cm. The results (see Table 1) show the superiority of the pure zinc over the ordinary metal in the plain condition, but the amalgamated pure zinc proved slightly less resistant than the amalgamated ordinary metal.

SERIES III. TESTS WITH RODS.—Eight rods were suspended from glass rods in a saturated solution of ammonium chloride for nine months. They were immersed to a depth of 11·8 cm. The plain pure zinc again proved superior to the ordinary, and the amalgamated pure zinc was also slightly superior to the amalgamated ordinary metal (see Table I.).

SERIES IV. LECLANCHÉ CELL TESTS.—Eight cells were fitted up in series and connected to a bell, which was used intermittently for nine months. The results (see Table I.) confirm those of the previous series.

SERIES V. TELEPHONE CELL TESTS.—Eight rods were placed in Leclanché cells in the college telephone batteries which were in constant use. After nine months the rods were removed, with the results shown in Table I. The amalgamated metals have behaved alike, and their superiority over the plain pure zinc is evident.

Comparing Series II. and III. it is seen that the plain zinc cylinders in Series II. lost very much more in weight in proportion to the amalgamated cylinders than the corresponding rods in Series III. Thus, in Series II. the cylinder ratio OZ : OZA is nearly 12 : 1, whereas in Series III. the rod ratio OZ : OZA is only 2·2 : 1. Similarly the cylinder ratio PZ : PZA is 3·6 : 1, whilst the corresponding rod ratio is 1·8 : 1. Possibly this is connected with the work done on the metal sheets when shaping them into cylindrical form. One would expect amalgamation of the surfaces to assist recovery to a fairly uniform potential.

The single OZA cylinder in Series II. lost less in weight than the PZA cylinder, although in general the OZA rods lost slightly more in weight than the PZA rods. This may, of course, be an accident. In any case one cannot safely generalise from a single test. The differences between the various zincs in Series V. are somewhat less than in the other series. This was to be expected, since in Series V. some of the zinc was used in service.

The Conclusions.

It is recognised that only two varieties of zinc have been used in these tests, and that the tests themselves have been limited in character; but the metals were typical commercial brands, and it is thought that the following conclusions are justified:—

(1) The use of plain high-grade 99·9% zinc in electric batteries cannot be recommended in place of amalgamated zinc.

(2) In dilute sulphuric acid the amalgamated pure zinc may be even less resistant to attack than the amalgamated ordinary metal.

(3) In ammonium chloride solutions there is little to choose between amalgamated pure and amalgamated ordinary zincs. No change from the usual practice of using amalgamated ordinary zinc is, therefore, recommended.

* From a paper read at a meeting of the Institute of Metals, in London.

AUSTRALIAN LETTER.

Unified Control of Generation for New South Wales.

By WILLIAM DAVEY (Managing Editor, "Australasian Electrical Times.")

MELBOURNE, *February* 25th.

ONE of the most important events of the month, electrically, is the move by the Government of New South Wales to establish a State Electricity Commission. New South Wales has a white population of 2 437 277, of whom 1 101 190 are living in Sydney. There are now over 250 electricity supply authorities, mainly municipal.

In the City of Sydney there are two authorities, the municipality, and the Electric Light and Power Supply Corporation, Ltd., the former having over 140 000 and the latter 21 000 consumers. Part of the energy distributed by the municipality is generated at the power stations of the Railway Commissioners, but the Civic Commissioners have just placed in commission the first 25 000 kW unit of their Bunnerong power station which will have an ultimate capacity of 300 000 kW, and this will gradually do away with the purchase of energy from the Railway Commissioners, who are electrifying their suburban railways, and will be requiring the full output of their generating stations.

The State Government has already done good work, its steam station at Port Kembla supplying a half-dozen country towns in bulk, and its hydro-electric station at Barren Jack a similar number. The Port Kembla power house has a capacity of 5 100 kW, the principal units being three 1 500 kW Brush-Ljungström turbo sets; and at Barren Jack there are two "Francis" type water turbines direct coupled to alternators, each having an output of 5 000 kW at 6 600 V, three-phase, 50 cycles.

New South Wales is standardising on 415/240 V for distribution, whereas Victoria uses 400/230V, the system in both cases being three-phase, 50 cycles.

The new Commission will have charge of all power supply matters, and will determine the most economical numbers and types of large stations to replace the present mass of small ones.

A movement which may not be unconnected with this is the formation in Sydney of a Radio and Electrical Development Association, in connection with the Electrical Employers' Association of New South Wales. The two movements in conjunction will doubtless expedite electrical progress, and enlarge the market for appliances of all kinds.

* * *

Australian electrical people have now had time to think and talk a good deal about the recent visit to this country of Sir Hugo Hirst, whose frankness in discussing with individuals and associations the problems of the electrical business in Australia was very acceptable to the Australian temperament. If more of your big men would come out and see this young country for themselves, they would form, in many cases, an opinion of its people and its opportunities, quite different from that which they now hold. The very blunders of Australia are evidence of a driving force which will not be gainsaid, and there is no doubt of the great electrical future of this Commonwealth.

You read much in England about our droughts and our bush fires, but most Australians have never seen either. You hear about our labour troubles, but the vast majority of Australian men and women are workers who have earned the admiration of Sir Hugo Hirst, and many other British industrial leaders by their capability, energy, and initiative.

* * *

The British General Electric Co., Ltd., has been entrusted with the supply of equipment for transmission of pictures between Melbourne and Sydney, which is to be placed in commission in about six weeks' time. The charge is to be 20s. per picture. The equipment will be of the "Siemens-Karolus" type, for which the General Electric Co., of England, has the British Empire rights.

Among other notable British business closed here during the month is a tender of John Thompson, Wolverhampton, for 8 boilers and accessories for the State Electricity Commission of Victoria, amounting to £233 000; that of the Australian General Electric Co., Ltd., for an 18 750 kW B.T.H. turbo-alternator, with condensers and auxiliaries, for the Brisbane City Council, at £67 427, and one of Messrs. Babcock and Wilcox, Ltd., for three boilers for the same authority, at £74 266.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

The Electric Sign Load.

[TO THE EDITOR.]

SIR,—Recent descriptions and illustrations in your paper of exterior shop lighting in the form of marquise lights and electric signs suggest that central stations have here an important load for development. In the striking sign used by Selfridge's during their birthday week is seen an example of remarkable developments offering in this field. Although I have not had access to the details, I estimate that roughly about 30 000 lamps were used for this gigantic sign, and if we assume that the individual voltage throughout was 30, we have a total load of some 900 kW, an item not to be sneezed at by most city supply undertakings.—I am, etc.,

"ELECSIVE."

London, N.W.1.
April 9th.

Electric Propulsion for River Boats.

[TO THE EDITOR.]

SIR,—It is with much pleasure that I note the encouraging words in your reference to the growing dangers of petrol engines in small river boats, the filthy smoke and smell, the awful noise which they make, and the very dangerous wash which they throw off, at the foolish speeds at which they are, so far, allowed to proceed.

During the last thirty years, I have had to make experiments with many petrol-driven boats, and also the electric battery boat, and can assure you that your words are perfectly true, and there is to-day no reason, whatsoever, why the public cannot enjoy the real pleasure of electric propulsion, at a reasonable commercial figure.

In the old days, and I am now speaking of my original experiments on the Thames back in 1890, we had not nearly the facilities which we have to-day, to demonstrate the almost ideal pleasures of electrically-propelled boats, and the commercial advantages of same for many industrial propulsion schemes. Very little was known by anyone, concerning the very complicated factors of the screw propeller, and most of the early electric boats had the very inefficient high revolution small area screw propellers fitted, and claims were actually made that this allowed the use of a lighter, and cheaper electric motor for the purposes. To-day we have much more efficient propellers, which are run at such low revolution speed, that very little cavitation takes place, and there is a consequent reduction in watt-energy used per ton-mile at any given boat speed.

Again, to-day, we have the benefit of the great advance which has taken place during the last 30 years in the design and construction, and of big improvements in the design and construction of storage batteries. In the old days we all used "series wound" motors for propeller driving, in spite of the fact that the torque characteristic of any sort of marine propulsion is almost ideal for "shunt" or separately excited propelling driving motors. We tolerated the loss of energy, due to series racing and slowing, when at uneven immersion of the propellers, and this again during my experiments I have found represents quite a big loss of watt-energy.

Then, how many supply stations actually made a real attempt to encourage the use of low voltage energy suitable for this pleasure craft business? In my opinion, if it was not for the few people who put down their own charging stations (and thus at the same time limited the radius of travel by the electrically propelled boat), there would have been even fewer electric boats than actually existed.

Again, there is the great question of steering control. Considerable loss in watt-energy takes place by the continued use of the rudder, owing to the crowded condition of the river, and it was this question which brought about my experiments with the "Paragon" steering and reversing propeller, described in Mr. H. M. Hobart's book on Electrical Propulsion of Ships (Harpers). By means of this new thrust making machine, we secure quite a lot of extra propulsive efficiency per unit of electrical energy used, not only because the actual propulsive power is used for steering, but, also because of the constant depth at which the blades are immersed.

The price of petrol is going up still higher in the future, and there is not the least doubt that builders and users of river-

Digitized by Google

craft are looking round for something not only better and safer, but, also cheaper than can be expected from the thermally inefficient petrol engine. By that statement, I mean, not only is the average thermal efficiency very low, owing to constantly throttling, etc., owing to traffic conditions, but in many cases the brake thermal efficiency is not more than 15 to 20%, and by the time the mechanical energy gets past the propeller losses (again owing to their very high revolution speed) only about 5 or 6% of the petrol fuel heat used actually pushes the boat.

Yes, Sir, I think that we can now expect something to happen. The pleasure loving public want real river pleasure cheaply, and above all with safety, but they will not get it while they adhere to early Victorian ideas and methods.

I quite agree with "Aquatic" in your issue of March 29th that people should demand electric propulsion. Then the great potentialities of this twentieth-century descendent from "Jacobi's" famous Russian experiment on the river Neva in 1838 will be realised. I am, etc.,

WILLIAM P. DURTNALL.

Westminster, London, S.W.1.
March 30th.

"Electrical Firms and the B.I.F."

[TO THE EDITOR.]

SIR,—I was glad to see that "Doubtful" last week revived the question of the suitability of the present date of the British Industries Fair, a point which has been discussed in your columns at various times during the past two or three years. It has, I think, been shown in these discussions, that a change in the date of the Fair is a reasonable and necessary alteration if the Fair is to justify its claim to appeal to and attract the attendance of buyers from overseas. Why, then, is it so difficult to secure adequate consideration of such proposals by the ultra-conservative members of the Fair Management Committee?

I know that some of those who are resisting the idea of a postponement until May or June base their arguments on the possibility of attracting buyers who have made long journeys to see the Leipzig and Vienna Spring Fairs. But if we want to secure the attendance of these buyers we must hold our Fair after and not before the Continental exhibitions, so that if our Fair were arranged to start immediately after the second of these—the Vienna Fair—it would fall in the third or fourth week in March. Personally I do not consider this to be an ideal time, but it would at least be an improvement on the present arrangement.

Again, those who consider that the early months of the year are generally acceptable to those participating in the Continental Fairs, are labouring under a misapprehension, for I note that in the official report on the business done at this year's Vienna Fair refers to requests that were made for holding that exhibition at a later date. The change was resisted, but mainly on the grounds that there must be no interval between Leipzig and Vienna, and that some of the visitors would have made arrangements based on the usual date.

It is obviously impossible to change the date of an exhibition a month or two before it is due to open, but it is only about that time that exhibitors seem to discover the need, and fair management committees to realise that an alteration is desired.

If the Birmingham Fair Committee is so sure that it is right in sticking to February why does it not ascertain the views of the electrical industry now, and not when it is too late?—I am, etc.,

H. C. M.

Newcastle.
April 8th.

ADDITIONAL GENERATORS FOR GATINEAU RIVER.

The Gatineau Power Co., controlled by Canadian Hydro-Electric Corporation, Ltd., a subsidiary of International Paper and Power Co., has started additional generators in its Farmers and Chelsea hydro-electric plants on the Gatineau River, six miles north of Ottawa. The two new generators, with a combined capacity of 58 000 H.P., raise the total installed capacity of the Farmers and Chelsea plants to 232 000 H.P. The total capacity of the plants of the Gatineau Power Co. is now 562 600 H.P. installed and in process of installation, slightly greater than the developed power on the American side of Niagara Falls. In 1928 the Gatineau Power Co. produced 1 286 000 000 kWh.

THE NATIONAL REGISTER.

Eighteen Further Applications Accepted by Executive Committee.

DESPITE the fact that the number of electrical installation contractors who are qualified for enrolment on the National Register of Electrical Installation Contractors is steadily diminishing, the Executive Committee at its last meeting, held at the Institution of Electrical Engineers on April 5th, had no fewer than 32 applications for consideration.

Of these, 18 were accepted, 4 withdrawn, and 10 declined. Names and addresses of successful applicants are set out below:—

Ashworth, Walter, 145, Chorley New Road, Horwich, Lancs; Barnes, F. A. and Son, Sussex House, New Road, Shoreham, Sussex; Bessant, A. J., Ltd., 32, Grove Road, Eastbourne; Carrack, J. W. and Son, 17, Vicarage Place, Kirkstall, Leeds; Davis, H. and Son, 30, Westbourne Road, Walsall; Dove, W. E. and Co., Ltd., Bondgate, Darlington; Durrant, Laurence H., 330, High Street, Harborne, Birmingham; Eyre, R. E., and Sons, 447, Yardley Road, South Yardley, Birmingham; Hall's Longitudinal Lighting Co., Ltd., 5, Victoria Street, Westminster, London, S.W.1; Harris, F. W. and Co., 9, Primrose Hill Street, Coventry; Henwood, J. H. and Co., 5, Church Row, Aldgate, London, E.1; Lincoln and Egerton, 40, Fuller's Hill, Great Yarmouth; Lye, Charles, 11, Northernhay Place, Exeter, Devon; McRobb, Andrew, 27/29, Adelphi, Aberdeen; Moffett, Charles R., 130, Victoria Road, South Shields; Rock Electrical Engineering Co., 36, Barker Street, Oldham; Rugby Electrical Engineering Co., Regent Place, Rugby; Whitton, Fred and Son, 19, De Lacy Mount, Kirkstall, Leeds.

The annual ordinary general meeting of the Registration Board will be held at the Institution of Electrical Engineers on April 15th at 2.30 p.m. The following is the agenda:—

(1) To receive and consider the reports of the Executive Committee and auditors of the balance sheet to December 31st, 1928.

(2) To receive nominations for members of the Registration Board, and confirm.

(3) To elect a chairman and vice-chairman for the current year of the Register.

(4) To receive a recommendation from the Executive Committee that certain examples of defective installation work shall be the subject of a Regulation or Standing Order of the National Register, and, if approved, to confirm same.

(5) To elect members of the Executive Committee in place of those retiring—viz., Messrs. Hunter, Dykes and Cash, all of whom are eligible and offer themselves for re-election.

(6) The election of auditors.

(7) Any other necessary business.

IN LIGHTER VEIN.

WHILE the members of the staff at the offices of W. T. Henley's Telegraph Works Co. were enjoying the Easter vacation, a London pigeon, presumably deciding that someone must work, though cable makers make holiday, gained access to the fifth floor *and laid an egg in a correspondence tray*. The bird had flown before the advent of the cleaners, but it left the egg behind it. Knowing bird!

* * *

The following definition of electricity is put forward by the "New York Utility Bulletin":—

Electricity is something that starts the Lord knows where and ends in the same place. It is $\frac{3}{4}$ of a second faster on its feet than its nearest competitor, backyard gossip, and when turned loose in Europe, will get to the United States five hours before it starts. Nobody knows exactly what it is, because it has never stood still long enough.

Electricity is sometimes known as science gone crazy with the heat, and if you can understand its manœuvres you can do anything with it except open a can of peanut butter at a picnic.

Electricity was locked up in ignorance for centuries until Ben Franklin let it out with a pass key, and since then it has been pulling off more new stunts than a pet monkey.

With it you can start a conversation or stop one permanently, cook dinner, curl your hair, press your trousers, blow up a battleship, run an automobile, or signal Mars, etc.

NEWS IN BRIEF.

Preston Electrical Exhibition—Chertsey Institution Lighting—Hire-Purchase at Swansea—Electric Pumping Plant at Northampton.

A NEW lighting system is being installed at the greyhound racing track at Slough.

Preston electricity department has been "overwhelmed" with inquiries as the result of its recent exhibition.

Steps are being taken at Charlbury, Oxon, to ascertain the number of residents who would avail themselves of an electricity supply.

Imports of electrical goods into the Irish Free State during February, last amounted to £30 886, as compared with £53 848 for the same month last year.

Aldershot T.C. is advertising for suitable premises for use as showrooms in connection with the electricity undertaking.

Glasgow Watch Committee has decided to re-wire and improve the electric lighting at the various police halls in the city.

Chertsey Board of Guardians has decided to use electricity at the Institution in place of gas, the supply to be given by the Woking Electric Supply Co.

Glasgow Finance Committee has appointed a committee to report upon the alterations and improvements of the electric wiring which will be necessary at the various burgh halls in order to obtain sanction to their use for cinema purposes.

At a meeting of the West Wales (Swansea) Sub-Centre of the Institution of Electrical Engineers, April 5th, Mr. J. W. Burr (Swansea) spoke on "The economic relation between electrical energy produced at a super power station and electrical energy produced by small power plants." He believed it would be impossible for the small and medium-sized stations to generate as cheaply as a super power station. At present, electricity was being generated for less than a pound of coal per kWh.

Following the fire at Pontardulais which gutted the distributing station of the Gorseinon Electric Supply Co., a new station was erected and the service restored within 48 hours.

The annual meeting of the North Midland Centre of the I.E.E. will be held at the Hotel Metropole, Leeds, on April 16th. Dinner will be served at 6 p.m., and a smoking concert will follow the meeting.

Members of the South Midlands Students' Section of the I.E.E. will visit the G.E.C. Witton works to-morrow (Saturday). This year's joint meeting with the Rugby Engineering Society will be held on April 23rd.

The annual meeting of the Iron and Steel Institute will be held at the Institution of Civil Engineers on May 2nd and 3rd, commencing each day at 10 a.m. The annual dinner will be held on May 2nd at the Connaught Rooms, London.

The next meeting of the Physical Society will be held at the Imperial College of Science, London, on April 19th, when the Guthrie medal will be presented to Dr. C. E. F. Guillaume. The lecture to follow will be delivered by Prof. W. R. Bridgman.

At a sales conference held by the North Midland area of the E.D.A. on April 4th, at Leeds, Mr. D. Millner read a paper entitled "Organising for Better Selling in Electrical Showrooms." Mr. F. N. Rendell-Baker presided, supported by Lieut.-Col. W. A. Vignoles.

A strike of 5 000 Chinese and Indian labourers, who have been engaged on the construction of the large dam in connection with the Perak River hydro-electric works at Chenderoh, commenced on April 1st. It is understood that the stoppage is due to a proposed reduction of 10% in wages.

Shipton-under-Wychwood will shortly enjoy street lighting by electricity.

It is reported that the Pope has ordered additional plant for the power station at the Vatican.

Members of the Institution of Mechanical Engineers will visit the new generating station at Oldham in June.

The annual general meeting of the North Western Students' Section of the I.E.E. will be held on April 16th. Following the meeting Mr. F. Roberts will read a paper entitled "Errors in Current and Voltage Measurements at Radio Frequencies."

Swansea Electricity Committee has adopted in principle the idea of supplying electrical apparatus on the hire and hire-purchase system, and instructed the engineer to prepare details.

Northampton Water Committee has received a report from the Water Engineer on the question of the electrification of the pumping plant at the Billing Road pumping station, at an estimated cost of £1 750. The saving on the present system is estimated at £300 per annum. The Committee recommends that, subject to satisfactory arrangements being made with the Northampton Electric Light and Power Co., as to power supply, the Engineer be authorised to purchase the necessary plant.

The Minister of Labour gives notice that he will designate to the Electricity Commissioners, the employees' organisations having members in the employment of authorised undertakers in the North-West Midlands Electricity District, in order that the organisations so designated may choose a representative of persons employed in connection with the supply of electricity in the District to be a member of the Joint Authority. Any employees' organisation desirous of being considered for designation should apply to the Minister by April 22nd, on a form to be obtained from the Secretary, Ministry of Labour, Montagu House, Whitehall, London, S.W.1.

At meetings of electrical engineers held simultaneously in Sydney and Melbourne, communication was made by means of the carrier-wave telephone system. Speakers in Melbourne and Sydney were heard with equal clearness at both meetings.

At the annual conference of the National Federation of Sub-Postmasters on Monday, it was resolved to ask for increased payment for telephone cabinets on sub-postmasters' premises. Delegates criticised automatic telephones, alleging that they lent themselves to fraud.

The public exhibition of works sent in for this year's open competition of Industrial Designs will be held under the auspices of the Royal Society of Arts, at the Imperial Institute, London, from August 3rd to September 1st. Entries must be in by May 27th, and the judging will take place in July.

In a paper read at a recent meeting of the Manchester Branch of the Institute of Public Administration, Mr. H. Townshend, the British representative on the International Telephone Consultative Committee, said international telephone communication—between Great Britain and France—was commenced in 1891. The personal call system, which guaranteed connection with the required person, was only in use in America and Scandinavia. Between the spring and autumn of last year calls between this country and France increased from 1 000 to 1 500 per day.

LOOKING BACKWARD.

FIFTY years ago, as reported in THE ELECTRICIAN *of April 12th, 1879:—*

Mr. Latimer Clark was considering the application of a thermo-electric battery for the production of light.

Under the command of Major A. C. Hamilton a troop of the Mounted Royal Engineers sailed for Natal. On arrival at the seat of war they were to form the Land Transport and Telegraph Corps.

An agreement for the extension of the lighting by electricity of the Victoria Embankment provided for the placing of 20 lamps between Waterloo and Blackfriars bridges. Thus, the electric light, with 40 lamps from Westminster, was "applied over a distance of 2 145 yards from one centre, worked by Ransome's series of 20 H.P. engines and two Gramme batteries."

* * *

TWENTY-FIVE years ago, it was recorded in THE ELECTRICIAN *dated April 15th, 1904, that:—*

Birmingham Corporation decided to build a new power station at Summer Lane.

Mr. G. C. Lloyd was appointed secretary of the Institution of Electrical Engineers, and Mr. P. F. Rowell, chief assistant to the late Mr. McMillan, became assistant secretary.

Representatives of municipalities owning and working telephones were considering what action should be taken with regard to the proposal of the Government to take over the National Telephone Co.

MANUFACTURERS' EQUIPMENT.

New Starting Gear for Squirrel Cage Motors—Electric Furnaces for Strip Metals and Wire—A New Portable Paint Sprayer—Heating of Workshops and Factories.

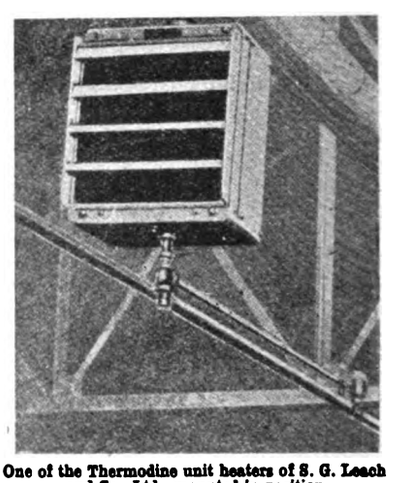
THE ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, has introduced a series of oil-immersed starters for squirrel-cage motors up to 650 V. These units are listed as Class OS, are ironclad in construction and are totally enclosed. Special features of the units are that the two throw switches with neutral "off" position can be operated by one handle; complete free handle freedom for releases to operate in any position required; drum and contactor type switching according to size is provided, which accessibility to contacts and all other parts has received adequate attention. The starters are made in four types, A being for direct-on starting of 2- or 3-phase motors on 3-wire circuits; B for star-delta starting; C for series-parallel starting of 2-phase machines on 3- or 4-wire circuits; and D for direct-on starting of 2-phase motors on 4-wire circuits. The starters can be fitted with a low-voltage release and one, two or three overload releases, while a trip coil for remote stopping can be provided if desired. In the latter case not more than two overload trips can be fitted. The low-voltage release consists of a contactor-type laminated magnetic circuit controlled by a phosphor-bronze spring, a damping winding being provided to ensure quiet working. The overload releases are mounted at the front of the starter and are supplied with time-lags. The overload setting can be adjusted over a wide range, the adjustment being effected from outside the starter. In the smallest size of starter the contacts are of the drum type with renewalable drum contacts and fingers. No flexible connection is used, and the drum is mounted eccentrically to assist return to the "off" position. In the larger sizes large "butt" type contacts are provided and so disposed as to give a horizontal break under a good head of oil. Fixed and moving contacts are interchangeable and either can be removed by taking out one screw. The operating mechanism consists of a system of levers acting on a modified toggle principle, which gives complete "free-handle" action. The contacts are held in the "run" position by a compound latch, which gives a delicate and reliable tripping arrangement. Where required, an ammeter can be fitted to the top cover. Connection is made by knife contacts and reinforced U clips so that easy removal of the starter cover is in no way interfered with. All starters are tested at 2 000 V a.c.

The "Cadillac" blow torch, by the Metropolitan-Vickers Electrical Co., Ltd.

An electric tubular furnace for the continuous heat treating of strip metal and wire has been designed and placed on the market by H. O. SWOBODA, INC., Pittsburgh, Pa. The furnace consists of a sheet steel-encased body about 20 in. high, 20 in. wide and 60 in. long, supported by four angle iron uprights. The chamber within the furnace consists of the usual refractory material used for furnaces of this type, the resistor and a tubing within the refractories forming the chamber proper. The nickel chromium resistor is arranged in four units of the "hairpin" type connected in series and extending over the length of the furnace. The tubing is made of an alloy which, it is claimed, will not scale at the operating temperature of the furnace; it is large enough to accommodate steel strips or wire up to one inch wide. The refractories forming the chamber are surrounded by fire bricks which withstand temperatures up to 2 500° F. and they are enveloped by heat insulating bricks which reduce the temperature of the outer casing to less than 175° F. The energy for the resistor is supplied by a single phase auto-transformer of the dry type, the primary winding of which can be furnished for any standard voltage. The control apparatus consists of a recording control pyrometer with the necessary switches and relays. The pyrometer records two temperatures, one being the temperature of the resistor, the other the temperature of the strip metal passing through. The automatic control is connected to the thermo-couple recording the temperature of the resistor. The strip metal can be passed through the furnace at speeds as high as 1 500 ft. per hour if not thicker than 0·006 in. Heavier strips have to be fed at correspondingly lower speeds. The energy consumption per pound of metal heat treated is stated to be slightly less than 0·1 kWh.

We have received from B.E.N. PATENTS, LTD., of 92, Tottenham Court Road, London, W.1, details of a new portable paint spraying equipment. It is claimed that this new gun utilises a new principle of atomisation, and requires a much smaller volume of air without sacrificing in any way the quality or efficiency of the work performed. It is also stated that the plant enables a comparatively small compressor to do the work formerly requiring a larger machine. Atomisation is effected on the discharge of 3½ cu. ft. of air per minute. The method of vapourising with the B.E.N. gun gives a smooth finish, obviating to a great extent any rubbing and cutting down. The unit is automatically controlled, and ensures a constant pressure of air in the tank at all times. Another feature is that the air receiver is insurable, being constructed of heavy steel, rivetted and tested to double working pressure. The motor used is a ¾ H.P.

A system of heating of interest to all trades, whether for the factory, office or home, is presented in the "Thermodine Unit Heater" marketed by S. G. LEACH AND CO., LTD., of 26/30, Artillery Lane, London, E C.1. By its use, it is claimed that an industrial plant can be heated as effectively as it is illuminated, it is possible to direct the heat down, just as light rays are directed where needed, while undesirable "cold spots" in a building can be eliminated. Some idea of the capacity of one of these units may be gathered from the fact that it is claimed that a radiating surface of approximately 3·5 sq. ft., and weighing 125 lb., replaces 600 sq. ft. of cast-iron radiation weighing over 2 tons. An inspection of the unit reveals that it consists essentially of three parts, the condenser, the manifold and frame, and fan. The condenser is constructed of seamless copper tube, held in position by horizontal fins so spaced as to baffle the air passing through. Soldered joints are eliminated, and in this way any possibility of softening under hot water or steam temperatures is prevented. The manifold consists of an upper cast tank and an integral welded steel structure of bottom and side members. Allowance is made for expansion and contraction in the method of attaching the condenser to the upper tank, and by allowing the lower end to move freely. On a steam system the unit only requires low pressure, the maximum necessary being 10 lb. The figures given on the next page, obtained by the makers as a result of tests made on Model 701 give some indication of the heat transfer.



One of the Thermodine unit heaters of S. G. Leach and Co., Ltd., mounted in position.

Model 701, with a steam pressure of 5 lb., gives a heat equivalent of steam condensed of 160 000 B.T.U. per hour with an air temperature of 60° F. entering the unit, and 183 000 B.T.U. at an air temperature of 45°. The units are installed overhead and throw the heat downwards. Due to their light weight it is possible to suspend these heaters from the steam main, with only the supply connection as a support. After

Digitized by Google

mains and returns have been run, the installation consists merely of making up two unions, one in the supply to and the other in the return from the heater, and making the necessary electrical connections. Thermodine unit heaters are manufactured in various sizes, the No. 700 series is designed

RESULTS OF TESTS WITH THERMODINE MODEL 701.

Steam pressure—5 lb.
Steam temperature—227° F.

Temp. Entering Average °F.	Total heat Delivered B.T.U. per hr.	Air delivery Aver. feet per min.	Final air Temp. °F.	Condensate lb. per hr.
30	203 000	1 883	125·8	210·5
40	191 100	1 906	128·7	198
50	178 800	1 928	132·0	185
Heat loss in still air	5 940	—	—	6·2

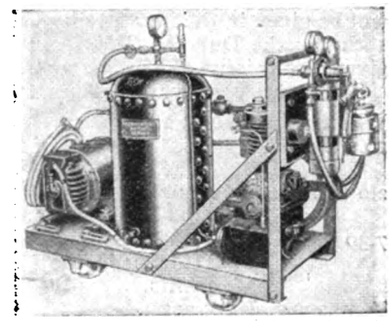
to replace from 600 to 700 sq. ft. of cast iron radiation. They are equipped with one-sixth horse-power motors. When equipped with the three-speed special motor any desired degree of quietness can be obtained. No. 500 series will replace about 500 sq. ft. of cast-iron radiation and are equipped with one-tenth horse-power motors, thus meeting the demand for a comparatively quiet unit. No. 300 series, is designed for heating smaller spaces, and will replace from 250 to 275 sq. ft. of cast-iron radiation. One-twentieth horse-power motors are fitted. No. 200 series will replace from 175 to 200 sq. ft. of cast-iron radiation. Equipped with one-thirtieth horse-power motors. No. 100 series will heat rooms that require from 90 to 100 sq. ft. of cast-iron radiation, and these are equipped with one-twentieth horse-power motors.

The METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester, has introduced a "Cadillac" blow torch designed to meet the demand for an instantly available forge for quick repair jobs and light routine work. The Research Department of the company in a report on these torches says "the results were decidedly good and the blow torch can be recommended as efficient. The control of the air is excellent and superior to the ordinary type of blow pipe. Wattage consumption is extremely economical (150 W) and the insulation resistance is satisfactory after a test of 10 days in ordinary workshop atmosphere." If used continually the gas consumption is only 70 cu. ft. per hour, or ½ therm. Laboratory tests gave the flame temperature at 2 900° F. or 1 600° C. The following table gives a comparison :—

METAL.	MELTING POINT.	ANNEALING TEMP.
Aluminium	1 214° F.	990° F. to 1 040° F.
Brass	1 650° F. (Approx.)	1 450° F.
Copper	1 982° F.	1 450° F.
Glass	2 007° F.	
Cast Iron	1 960° F.	
Wrought Iron	2 768° F.	
Nickel	2 646° F.	
Gun Metal	1 825° F.	
Steel Castings		1 500 F. to 1 700° F.

In considering these figures it must not be taken for granted that any metal or substance with a melting point below 1 600° C. can be readily operated upon with a blow torch. Much depends on the size of the job in hand. The machine is simple, the essential point being that the motor should always be turned on first and turned off last. In other words, the motor must at all times be running when the gas is on, in order to carry the latter out of the machine. If this instruction is reversed, gas will accumulate in the fan chamber and backfire will result. The gas tube is connected to a gas main, not necessarily under pressure as the blower will create its own volume of displacement. The motor is connected to any convenient point, and to commence operations the motor should be started with the air intake valve on the fan chamber fully open. It should then be partly closed and the gas turned on whilst holding a lighted match in front of the torch burner. Immediately the gas ignites it will cause a fairly loud report, and the air intake should then be fully opened to get the requisite blue flame. Intensity is regulated by the air valve.

The GODFREY ENGINEERING CO., LTD., 18, Essex Street, Strand, London, W.C.2, has sent us particulars of the "Godfrey" oxygen jet cutting machine. This is fitted with two compound traversing slides, i.e., main slide and cross slide, with automatic screw feeds, which can be manipulated manually exactly as on a milling or slotting machine, enabling much work to be done without the use of any template. It will cut square or oblong holes from 1½ in. by 1½ in. up to 3 ft. by 3 ft. without a template, and by means of trip actions on each traverse which automatically stop the cut at the required distance, the cut can be exactly duplicated without resetting. The circular motion on the cross slide enables circular holes or blanks to be cut in plates from 1½ inches to 36 inches in diameter in graduations of one thirty-second of an inch. This circular attachment can be brought into correct position by means of the screw feed on the traversing slides. A removable graduated bar scaled in thirty-seconds of an inch controls the path of the torch, so that it can be set to the size of hole required without the necessity of making any measurement. A rotating table can be provided if required which also serves as an adjustable work table that can be moved to any position relative to the machine, so that discs or holes up to 15 feet diameter or more can be cut. A bed plate is provided to carry the rotating table and keep it in exact alignment with the cutting machine. The table will rotate under a load up to 8 tons. A mandrel fits into the centre of the table, whereby collars, cams, etc., can be quickly made. This mandrel is equipped to carry a template at the top, enabling irregular shapes to be cut. A division plate is arranged below the table which enables the operator to cut large square, hexagon, or octagon nuts and other pieces without a template. For simple irregular shapes templates can be made out of ply-wood. For complicated shapes each machine is equipped with a specially designed automatic attachment, together with a special machine for cutting compound ply-wood templates. Both traversing slides and the rotary attachment on cross slide can be worked simultaneously. The machine is fitted with a speed regulator to give required variable speeds for different thicknesses of metal.



The dual air unit and paint spraying equipment of B.E.N. Patents, Ltd.

The results of a series of tests of soldered aluminum joints, reported by Mr. A. Kapteyn, president of the ALUMINUM SOLDER CORPORATION OF AMERICA, indicate that lap joints are in many cases as strong as the metal itself. The ultimate strength of duralumin to duralumin butt joints was 30 000 lb. per sq. in.; that of aluminum to aluminum butt joints was 12 000 lb. per sq. in. when the joint broke, but in several cases failure did not occur at this point. Nearly all the aluminum to aluminum lap joints were stronger than the metal itself. In the case of soldered joints subjected to salt spray for two weeks, said to be the equivalent of two years' exposure, there was apparently no reduction in the strength of the joints. The soldering material was "Soldalume," and the tests were conducted by the testing laboratory of Columbia University, New York.

DONOVAN AND CO., 47, Cornwall Street, Birmingham, have introduced a new isolating link which consists of a cast iron case arranged to connect to 1¼ in. conduit at one end, and to conduit or to a starter or switch at the other end. Inside the case are fitted 2 d.p. or 3 t.p. porcelain-clad bases arranged to take cable up to 19/.064, fitted with hand-shield porcelain clad removable links. The contacts are self aligning, and, it is claimed, the contact is such that the capacity could be increased five or six times were the size of the cable not limited by the dimensions of the terminals. The electrical resistance of these links approximates to 6 in. of 19/·052 cable, and the watt dissipation per link at 60 A is under ½ W. When work is to be done on the control gear, the current is first switched off and the shielded links are removed; the whole of the control gear, including all its mechanism, is then isolated from the live supply, and can be cleaned and adjusted without danger. One size only is manufactured up to 60 A, so that contractors and engineers may standardise the No. 1 size for all ordinary duty. It is understood that higher currents than 60 A require a larger size.

H. CLARKE AND CO. (M/C) LTD., "Atlas" Works, Old Trafford, Manchester, advise us that they are prepared to send to manufacturers for testing purposes, samples of any of their products These include micanite in flexible, moulding and commutator qualities; tubes, round, square or oval, in pure mica, mica paper, paper and bakelite; micafolium, mica cloth, mica paper, fibre, leatheroid, presspahn, Indian and Egyptian cotton tapes, "Atlas" varnished cloth, tape, silk and paper, cotton sleeving, black adhesive and rubber tapes; "Atlas" superfine and tubular sleeving in natural colours or dyed.

THE E.C.A. CONFERENCE.

Preliminary Details of the Forthcoming Visit to Bournemouth.

AS already announced in THE ELECTRICIAN, the fourth annual conference of the Electrical Contractors' Association will be held at Bournemouth, on Wednesday, Thursday and Friday, June 26th, 27th, and 28th. The business meetings will be held in the Town Hall, while the social events will be given in the new Pavilion which was opened on March 19th, by the Duke of Gloucester and of which details were given in our issue of March 22nd.

The provisional arrangements are :—

WEDNESDAY, JUNE 26TH.

10.0 a.m.	Joint meeting of the Councils of the E.C.A., N.E.C.T.A., and N.F.E.A. at the Town Hall.
2.0 to 10 p.m.	Arrival of delegates and registration at the new Pavilion.
7.30 p.m.	Reception by the President at the Pavilion. Dancing in the ball room and light refreshments.

THURSDAY, JUNE 27TH.

9.30 a.m.	Annual General Meeting at the Town Hall. (Open to members only.)
11.30 a.m.	Opening of Conference at the Town Hall. Address of Welcome by the Mayor of Bournemouth (Ald. C. H. Cartwright), and reply by the President. Presidential address by Mr. W. H. Walton.
12.30 p.m.	Luncheon.
2.0 p.m.	Delegates assemble at the Central Station, Bournemouth.
2.15 p.m.	Departure by special train for Southampton.
3.20 p.m.	Arrive Southampton Docks and proceed on board R.M.S. "Aquitania" for tour of inspection.
5.0 p.m.	Tea at the South Western Hotel.
5.45 p.m.	Departure of special train from Terminus Station, Southampton.
6.35 p.m.	Arrival at Bournemouth.
8.15 p.m.	Smoking concert at the new Pavilion.

FRIDAY, JUNE 28TH.

9.30 a.m.	Conference re-assembles at the Town Hall, for paper and discussion.
1.0 p.m.	Luncheon.
2.30 p.m.	Conference re-assembles at the town Hall for second paper and discussion.
4.0 p.m.	Tea Interval.
4.30 p.m.	Installation of new President and short address.
5.0 p.m.	Official photograph.
9.0 p.m.	Ball and supper at the new Pavilion by invitation of the Mayor of Bournemouth.

Arrangements can be made for golf, bowls, tennis, drives, etc., for those members who are desirous of remaining in Bournemouth over the week-end.

LIGHTING SERVICE LECTURES.

Special Lectures to the Trade on Technical Characteristics of Glareless Lamps.

A LIST of lectures which will shortly be delivered by Mr. W. J. Jones and Mr. H. E. Hughes, of the E.L.M.A. Lighting Services Bureau, in all the principal centres in the country, has been prepared. These lectures have been arranged for members of the electrical trade exclusively, and have as their object the popularisation of glareless lamps, by a complete explanation of their technical characteristics and sales potentialities.

The dates of the lectures, towns, etc., are as follows :— April 12th, London (15, Savoy Street, W.C., 6 p.m.); April 15th, Glasgow (Royal Philosophical Society Hall, 207, Bath Street, 7.45 p.m.); Manchester (Bureau, 4, Fountain Street, 7 p.m.); April 16th, Edinburgh (Royal Scottish Society of Arts Hall, 117, George Street, 8 p.m.); Liverpool (CommonHall, 3, Hackins Hey, 6.30 p.m.); April 17th, Newcastle (Bureau, Dial House, Northumberland Street, 6 p.m.); Birmingham (Windsor Room, Grand Hotel, 7.30 p.m.); April 18th, Cardiff (S.W. Institute of Engineers, 3.30 p.m.); Leeds (Philosophical Hall, Park Row, 7 p.m.); April 19th, Sheffield (Montgomery Hall, Surrey Street, 7 p.m.); Bristol (Lesser Hall Merchant 'Venturers' Technical School, 7.30 p.m.).

PERSONAL.

AT a general meeting of the Royal Institution on Monday, Sir William Larke, Sir John Snell and Mr. H. E. Wimperis were elected members.

Estate of the gross value of £145 638, with net personalty £134 900, was left by the late Mr. John Marshall Gorham, a director of Drake and Gorham.

The Slough and Datchet Electric Supply Co. presented an oak clock to Miss Dorothy E. Knight and Mr. Charles Gillham on the occasion of their marriage at Upton last week.

Mr. G. A. Vowles, central station superintendent, Stoke-on-Trent, has been appointed personal technical assistant to Mr. J. N. Waite, electrical engineer, Hull, at a salary of £624 per annum.

The Direct Spanish Telegraph Co., Ltd., announces that Admiral H. W. Grant, has been elected a member of the board of the company and that Mr. J. C. Denison-Pender has been appointed chairman.

Mr. S. E. Fedden, general manager and engineer of Sheffield electricity department, has been appointed district engineer for the Mid-East England Electricity Scheme under the Central Electricity Board. He will take up his new duties on May 1st. See page 455.

Stockport T.C. has adopted the recommendation of the Electricity Committee for the appointment of Mr. Robert Lee as borough electrical engineer. He was for many years assistant electrical engineer at Stockport, and went to St. Helens as electrical engineer about twelve months ago.

Mr. H. F. G. Woods, borough electrical engineer and manager, has resigned his position with Torquay Corporation, and after some nine years' experience of the municipal system, has decided to revert to company work, having accepted the position of general manager to the Exe Valley and East Devon Electricity Supply Companies.

Mr. Robert Blackmore, district engineer for the North-West England and North Wales Electricity Scheme, has now vacated the office of chief electrical engineer to the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board, which has adopted a resolution expressing appreciation of Mr. Blackmore's services during the last 25 years.

Mr. A. E. Hailwood, who came into public notice last year by his opposition to the Government, has announced his intention of putting forward candidates in Northern Ireland at the forthcoming general election. He will shortly open his campaign in Belfast, in which safeguarding for the linen industry will play a prominent part. It is understood that he or his nominees will contest North and East Belfast and possibly one or two of the county constituencies.

Dublin City Commissioners last week passed a resolution that on the occasion of the transfer of the Dublin electricity undertaking to the Electricity Supply Board, the Commissioners desired to record their high appreciation of the skilled knowledge, sound judgment and business capacity which Mr. Lawrence J. Kettle, the engineer and manager, had exercised during his twenty-three years' service. The Commissioners also paid tribute to the zeal and loyalty of the staff.

Obituary.

MR. ROBERT HENRY BENSON, on Sunday, aged 79 years. He was chairman of the Anglo-American Telegraph Co. and was on the board of the St. James' and Pall Mall Electric Light Co., and a director of the London Electric Supply Corporation.

MR. VALERE A. FYNN, on March 20th, aged 58 years, at St. Louis, Mo. He contributed largely to the development of the single-phase motor and to other inventions relating to motors, among which is the Fynn-Weichal motor. He obtained his early engineering experience with Brown, Boveri and Co., in Switzerland and with Easton, Anderson and Golden in London, and subsequently he established offices in London as a consulting engineer. His single-phase motors were manufactured by the Elektricitäts-Gesellschaft Alioth of Switzerland, France, Germany, Italy and Spain, and the General Electric Co. of England In 1909 he transferred his interests to the United States, and from that year until 1921 he was retained by the Wagner Electric Manufacturing Co. as consulting engineer. Since 1921 he was engaged in independent consulting engineering work with offices in St. Louis. Mr. Fynn was a fellow of the American Institute of Electrical Engineers and a member of the Institution of Electrical Engineers.

TRADE PUBLICATIONS.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby, has published list L.469 dealing with the reduced prices of Mazda "pearl" lamps.

The MULLARD WIRELESS SERVICE CO., LTD., Denmark Street, London, W., has published leaflet V.T.33 dealing with type S.W. 3B transmitting valve for short wave work.

The MARCONIPHONE CO., LTD., has published a special coloured poster relating to the deferred payment purchase of the Model 37 receiver. Photographic showcards concerning Models 23a, 35, and 44 have also been issued.

The DRAYTON REGULATOR AND INSTRUMENT CO., LTD., of West Drayton, Middlesex, has issued a new leaflet relative to thermo-contactors types R.C., I.C, H.C., and T.C. Another booklet, dealing with pressure and temperature operated electric switches, has also been issued.

The "Benjamin Reflector" No. 7, Vol. 2, published by BENJAMIN ELECTRIC, LTD., Brantwood Works, Tottenham, N.17, is devoted to the improvement of factory lighting. The issue is arranged to indicate "the ideal," "the complaint," "the diagnosis," "the prescription," "the cure" and "the attainment." The publication is illustrated accordingly.

L. G. HAWKINS AND CO., LTD., have issued a number of pages for inclusion in their general catalogue. These include descriptions of the electric washer and wringer, No. E. 1 250; "Blazor" electric fires; "Peter the Seer," which prevents windows being affected by atmospheric changes; and the "All Over" electric hair clipper. A leaflet dealing with "Vio Ray" artificial sunlight apparatus has also been published.

Direct current hand operated and automatic control switches are dealt with in catalogues Nos. 12 and 13, by BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester. These issues are illustrated throughout, and all technical as well as other details are embodied in well worded descriptions. Catalogue No. 12 covers the complete range of d.c. hand operated gear, while No. 13 also covers the automatic range. These two catalogues together supersede and cancel catalogue No. 5 and the d.c. portion of No. 10; the a.c. portion of the latter still stands. The junior drum type panels shown in catalogue No. 10 have been absorbed in the main drum range (catalogue No. 12) and the junior solenoid type in the main solenoid range (catalogue No. 13), the gears being modified so that the specification agrees. Catalogue No. 13 includes a new range of junior solenoid panels (originally designed for printing machinery); also a complete range of contactor type panels. The gears in both new catalogues embody drip-proof hoods and other detail improvements.

I.E.E. GOLF COMPETITION.

THE second annual golf tournament of the Scottish Centre of the I.E.E. in aid of the Benevolent Fund and for the trophy presented by Messrs. W. L. Winning and Andrew Hutchison, will be held this summer on the various courses within the Scottish Centre. The competition will be open to members of all classes, and should specially appeal to the benevolent instincts of every member and student of the Centre. The Committee would like every member of the Institution to subscribe to this competition, whether he be a player or non-player, in view of the particular object for which the competition is being promoted. The competition in the first place will be divided into districts, and the following have consented to undertake the duties of local secretaries:—

GLASGOW: Mr. Harold W. Bewsher, 147, St. Vincent Street, Glasgow, C.2; EDINBURGH: Mr. J. Johnstone Foggo, 37, St. Patrick Square, Edinburgh; DUNDEE: Mr. P. Philip, Dundee Electricity Department, Dudhope Crescent Road; ABERDEEN: Mr. J. Alex. Bell, Aberdeen Electricity Department, Millburn Street.

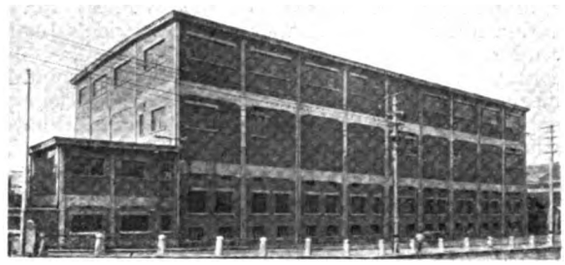
A SUCCESSFUL APPEAL.

The appeal of Babcock and Wilcox, Ltd., against a fine of £1 000 and an order for payment of £10 000 to the Sydney Electricity Department, imposed by the Sydney magistrates, has been allowed by a majority judgment of the New South Wales Court of Appeal. The company had been found "guilty" of charges of corruption in paying £10 000 to Mr. S. Y. Maling, former manager of the Electricity Department, in connection with tenders for power plant. The Court of Appeal held that there was no evidence to show that the company had authorised the payments alleged.

The Crown Law Department has decided to appeal against the decision.

BUSINESS ITEMS.

MR. CECIL HODGES announces that he has no connection with any company bearing his name except the HODGES SWITCHGEAR CO., LTD., of Wool Exchange, London, E.C.2, and HODGES & DIXON, LTD., which has been absorbed by the former.



THE super sub-station of Shanghai Electricity Department in Fearon Road, the lighting scheme for which is carried out on the Henley wiring system. Among other recent installations in Shanghai for which this method has been used are the Brunner Mond Building, the Bank of China—which used to be the German Club—and Kelmscott Gardens.

It is reported that FERRANTI, LTD., Hollingwood, Lancs., will establish a branch at Mount Denis, a suburb of Toronto. A modern plant, 110 by 400 ft. will be erected and the principal lines of manufacture will be radio equipment, meters and transformers.

The NOX ELECTRIC LAMP CO., LTD., Clarence Road Works, Hunslet, Leeds, points out that the company's works are being extended. For the year ended March 31st the output was just a fraction under double that of 1928. Preparations are being made with regard to plant and extensions, to double last year's output.

Arrangements are being made under which R.I. products will henceforth be distributed and invoiced by RADIO INSTRUMENTS, LTD., direct from 12, Hyde Street, London, W.C.1, on the same system as that in force prior to the appointment in June, 1927, of R.I. and Varley, Ltd., as distributing agents, the arrangements with that company having terminated.

The RELAY AUTOMATIC TELEPHONE CO., of Relay House, Streatham Hill, London, S.W.2, is making for the Manchester station of the B.B.C. a new power board for controlling the plant for charging the large accumulators which supply current to the main transmitting valves and for regulating the charging equipment for the high tension and grid bias batteries. This power board will control three charging motor generators and will provide the necessary switching for changing over the batteries from charge to discharge. The supply mains are of 400 V, while the large batteries are 6, 8 and 50 V. The small batteries used for grid bias purposes are 24, 150 and 300 V units. There is also a distributing fuse panel for small subsidiary circuits fitted to the board, a photograph of the back of which is given on page 458.

Owing to the fact that there appears to be a wrong impression in regard to the retention of the Dolphin standards on the Victoria Embankment, London, the GENERAL ELECTRIC CO., LTD., announces that in the new scheme of illumination the original standards along the parapets are definitely to remain, and will still function as they have done since the Embankment was opened in 1870. There is also some misconception concerning the new system of twin overhead suspended lighting along the roadway, which is to be done by means of two 1 500 W lamps, housed in "Wembley" lanterns suspended 30 ft. over the roadway. In all, there are to be 50 spans, spaced at intervals of 140 ft., each span carrying two lamps. The existing standards alongside the kerb-edge of the Embankment are being removed with a view to their ornamental bases being re-spaced and augmented to accommodate the new steel suspension poles, which will be mounted in such of the existing bases as are at present fixed along the Embankment, and which, bearing the small dolphin design and the old coat of arms, will be retained to accommodate the new poles. As, however, there will not be enough of these old bases, new ones are being supplied of similar design, but embodying the new L.C.C. coat of arms in place of that of the old type. See page 455.

WIRELESS NOTES.

Wireless Telephony and Shipping—American Radio Exports during 1928.

IT is reported that the use of wireless apparatus in Siam is temporarily prohibited.

The German Government is arranging for the installation of loud speakers in the Reichstag.

The annual general meeting of the Wireless Retailers' Association was held on Wednesday, at St. Bride's Institute, London, E.C.4.

According to the Wireless Branch of the Commonwealth Postmaster-General's Department there were at the end of September last approximately 300 000 licensed listeners in Australia.

The first automatic wireless beacon in Canada was inaugurated on Seal Island, Nova Scotia, last week. This is the first of a chain of seventeen beacons stretching from the Gulf of St. Lawrence to the Great Lakes.

At a meeting of representatives of Hamburg shipping companies on Monday, it was stated that technical difficulties in the way of wireless telephonic communication with ships at sea had been removed, but there were still obstacles in the way of fitting passenger vessels with the necessary telephone apparatus on account of expense. Experiments are now being made with fishing vessels, and it is asserted that, as the use of the telephone does not require any special skill, this would render unnecessary the carrying of a wireless operator.

Shipments of radio apparatus from the United States during 1928 amounted to $12 061 410, an increase of $2 878 987 over 1927. Canada was the largest consumer of these shipments, having taken approximately 40%. Argentina and Australia were next in importance; these countries purchased radio apparatus valued at $1 613 693 and $1 189 450 respectively. Argentina's principal imports were receiving sets and components, but Australia took chiefly receiving sets and accessories, although components valued at $239 992 were shipped to that country during the year. The market in the United Kingdom was limited to a small amount of components and accessories. Uruguay took $148 385 worth of receiving sets during 1928.

A "Gecophone" adjustable reed cone movement for portable sets and small power loud speakers, has now been introduced by the General Electric Co., Ltd. In general design the movement consists of an electro-magnet mounted beneath the free end of a reed armature. A thumb-screw at the back of the magnet-and-armature supporting frame controls a helical-spring armature adjustment. The reed, which has a length of just over 2½ inches, is fixed to the upper side of the armature and is not susceptible to "chatter." As this movement is of the single pole type, it is important that the h.t. supply be connected to it in the correct way. On the side of the supporting frame are the two loud speaker terminals, and one of these is clearly marked with a positive sign in order to ensure that the unit be correctly connected.

ARTIFICIAL LIGHT TESTS.

New Apparatus for Examining Dyed Materials in Artificial Light.

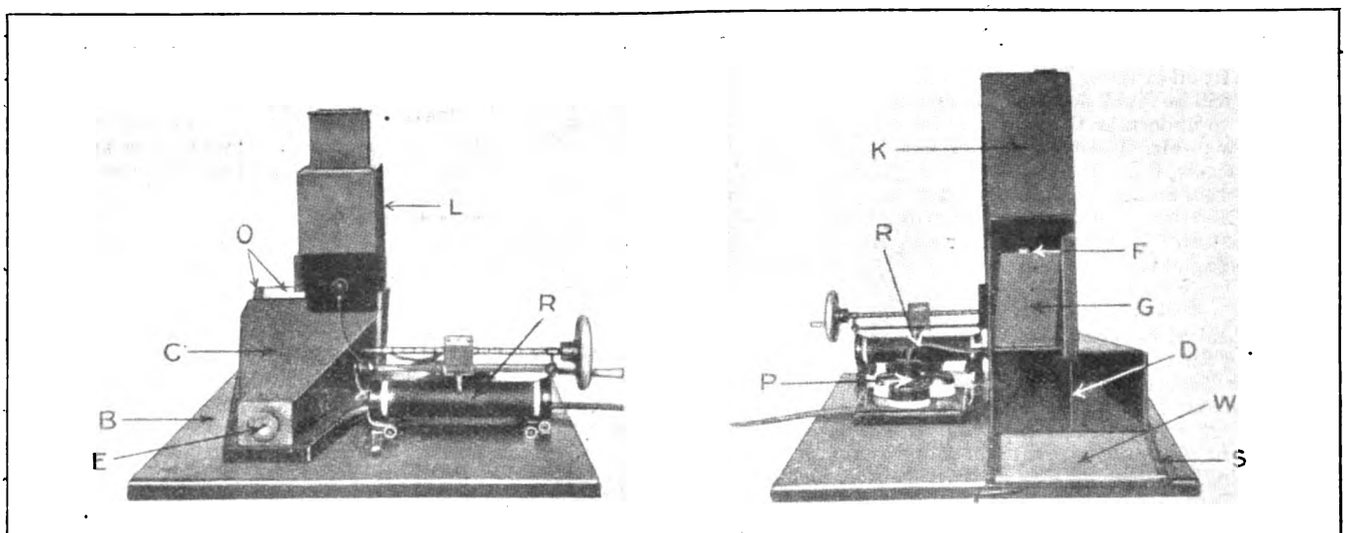
AN application for a patent for an apparatus for the examination of dyed materials in artificial light has been made by Imperial Chemical Industries, Ltd. The difficulty of making an accurate comparison between the effects of daylight and artificial light on dyed materials has led the British Dyestuffs Corporation to design a special equipment for the purpose, and a description of the plant has just been published. The apparatus consists of a casing C (see Figs. 1 and 2), divided in two compartments by means of a longitudinal division D. At the narrow end of the casing is an eyepiece opening E, the opposite end being closed by means of the shutter S holding a wooden slide W. Above one compartment is a lamp casing L holding an electric filament lamp F, the light from which is scattered by a ground-glass slide G. The lamp is ventilated with screened ventilation holes. One compartment is illuminated by daylight which enters through the side and top at O, while the other compartment is illuminated by the light of the lamp. A door K in front of the lamp casing allows the ground glass or lamp to be removed and other lamps inserted. The casing is fixed to the base board B, where a switch or plug P, together with a variable resistance R, are connected with the lamp. Duplicate patterns of the material to be examined are fixed one on each side of the slide W, and the shutter S closed. The apparatus is placed adjacent to a window so that the opening O is well illuminated with daylight. The lamp is then switched on, and the patterns viewed through the eyepiece E, when the two patterns of the material are seen simultaneously illuminated by daylight and artificial light respectively. The intensity of the artificial illumination is then adjusted by means of the resistance R until it is equal to that of the daylight, when the change in tone, if any, can be readily seen. Various types of filament lamps can be used to give light of varying quality.

This apparatus can also be used for testing "daylight" bulbs or "daylight" filters. For this purpose dyed patterns should be selected which show marked differences when examined in daylight and artificial light.

THE SOCIAL SIDE.

The tenth annual G.E.C. London sports gathering will be held at Wembley on June 8th.

The London Telephonists' Society produced at King George's Hall, Tottenham Court Road, London, W., on April 4th, a play entitled "Telephone Tangles, or Love in a Mist," the subject matter for which showed a very considerable appreciation of the shortcomings of the telephone service. Loud applause and laughter, from a hall crowded with telephone operators, greeted a scene showing the entrance to a telephone exchange, with a number of complaining subscribers waiting to step into a lift that was out of order.



THE new apparatus which has been developed by Imperial Chemical Industries, Ltd., for the examination of dyed materials in artificial light. Fig. 1, referred to above is shown on the left, with Fig. 2 on the right.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

FIRST CHURCH OF CHRIST SCIENTIST, BLACKPOOL.—Electric wiring, fittings, etc., in new building. Further particulars from Mr. H. Best, 20, Clifton Street, Blackpool.

STOKE-ON-TRENT CORPORATION, April 12th.—Supply and erection of 22/24 H.P. heavy oil engine at Stallington Hall, near Stoke-on-Trent (contract 2 915). Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

PRESTWICH URBAN DISTRICT COUNCIL, April 13th.—Supply of electric lamps, etc. Form of tender from the Surveyor, Town Hall, Prestwich, Lancs.

BATLEY CORPORATION, April 15th.—Supply of l.t. cable. Forms of tender from the Borough Electrical Engineer, Electricity Works, Batley.

BRIDPORT CORPORATION, April 15th.—Complete installation of three-phase cables, h. and l.t. underground and overhead sub-stations, street lighting and services. Specification, etc., from the Town Clerk; deposit £2 2s.

CANTERBURY GUARDIANS, April 15th.—Completion of electric light installation at the Institution. Particulars from the clerk, Mr. H. Rose, 80, Castle Street, Canterbury.

IRVINE CORPORATION, April 15th.—Electric lighting work in 24 dwelling-houses to be erected at Clark Drive, off Thornhouse Avenue, Irvine. Specifications from the Town Clerk; deposit £1 1s.

SUDBURY CORPORATION, April 15th.—Supply of electric fittings, etc., for one year. Forms of tender from the Borough Surveyor, Town Hall, Sudbury, Suffolk.

CENTRAL ELECTRICITY BOARD, April 15th.—Supply and erection of 33 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-S.L.2) from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EAST LOTHIAN EDUCATION AUTHORITY, April 15th.—Electrical and heating installations in new school at Tranent. Schedules, etc., from Messrs. R. and A. K. Smith, 4, Forres Street, Edinburgh.

YSTRAD MYNACH AND DISTRICT WELFARE ASSOCIATION, April 15th.—Electric lighting installation in connection with erection of a pavilion on the Association's grounds. Specifications can be seen on the site.

BIRKENHEAD CORPORATION, April 16th.—Twelve months' supply of stores to the electricity generating station, including house service and mains boxes, insulating tapes, electrical engineering sundries, etc. Specification, etc., from Mr. F. E. Spencer, borough electrical engineer, Craven Street, Birkenhead.

MANCHESTER CORPORATION, April 16th.—Supply of electric welding apparatus, for tramrails. Specifications, etc., from the General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

DUMFRIES CORPORATION, April 17th.—Supply and erection of one water cooling tower, for the Electricity Department. Specification, etc., from Mr. W. S. Johnston, engineer and manager, Electricity Works, Leafield Road, Dumfries; deposit, £1 1s.

LEEDS GUARDIANS, April 17th.—Supply and erection of steam driven generating sets, boiler feed pumps, etc.; and supply and erection of switchboard and mains, at the Institution, Rothwell, near Leeds. Specifications, etc., from Mr. E. Griffiths, 44d, The Temple, Dale Street, Liverpool, until April 9th.

Public Institution Lighting.

METROPOLITAN ASYLUMS BOARD, April 17th.—Electric light installation at the Hostel, Little Gray's Inn Lane, London, E.C.1. Specification, etc., from the Board's office, Victoria Embankment, E.C.4; deposit, £1 1s.

SMETHWICK CORPORATION, April 17th.—Electric light installation at slipper baths, Mallin Street, Smethwick. Specification, etc., from the Borough Engineer, Council House, Smethwick; deposit £1 1s.

WEST RIDING EDUCATION COMMITTEE, April 17th.—Electric light installation at Edlinton New Middle and Elementary Schools and caretaker's house. Specifications, etc., can be obtained from the Education Officer, County Hall, Wakefield.

BIRMINGHAM GUARDIANS, April 18th.—Installation of call lighting system, at Dudley Road Hospital, Birmingham. Conditions, etc., may be seen at the Union Offices, Edmund Street, Birmingham.

RENFREWSHIRE EDUCATION AUTHORITY, April 19th.—Electrical work in connection with alterations and additions to North Public School, Paisley. Schedules, &c., from Mr. J. H. Pullar, 16, Glasgow Road, Paisley; deposit £1.

CENTRAL ELECTRICITY BOARD, April 22nd.—Supply and erection of 33 000 V and lower voltage transformers. Specification (No. N.W.E.-ST.2) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Scottish School Lighting.

EDINBURGH EDUCATION AUTHORITY, April 22nd.—Electric lighting work, in connection with erection of Saughton Mains School. Specifications, etc., from Mr. J. A. Carfrae, 3, Queen Street, Edinburgh.

DUNDEE CORPORATION, April 24th.—One year's supply of stores to transport department, including armature and field coils, carbon brushes, etc. Specifications from Mr. D. P. Morrison, Transport Office, Dundee.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC.—April 22nd.—Supply of incandescent lamps. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, S.W.1.

DUNDEE HARBOUR TRUSTEES, April 27th.—Supply and erection of two 3-ton electric travelling jibs, portal cranes at King George V. Wharf, Dundee Harbour. Specifications, etc., from the General Manager and Engineer, Harbour Chambers, Dundee.

CENTRAL ELECTRICITY BOARD, April 29th.—Supply and erection of electricity meters, in connection with the Central Scotland Electricity Scheme. Specification (No. C.S.-S.S.14) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

SOUTHAMPTON CORPORATION, April 30th.—(1) Steel framed building, platform for fans, overhead bunkers, etc.; (2) two water tube boilers with superheaters, economisers, stokers, fans, soot blowers, etc.; (3) steam, feed water and other piping, etc.; and (4) water softener, at Electricity Works, Western Esplanade, Southampton. Specification, etc., from Mr. W. G. Turner, borough electrical engineer; deposit, £2 2s.

STAFFORDSHIRE EDUCATION COMMITTEE, April 30th.—Electric light installation in the Girls' High School, Stafford. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit, £3 3s.

STAFFORDSHIRE EDUCATION COMMITTEE, April 30th.—Electric light and power installation in new High School for Girls, Wellington Road, Bilston. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

WALTHAMSTOW EDUCATION COMMITTEE, May 3rd.—Electrical installation in Billet Road School, Walthamstow. Specification, etc., from Mr. G. R. Spurr, Electricity Works, Exeter Road, Walthamstow, London, E.17; deposit £1.

CENTRAL ELECTRICITY BOARD, May 4th.—Supply and erection of 33 000 V and lower voltage cables, under the South-East England electricity scheme. Specification (No. S.E.E.-G.C.1) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

ISLINGTON (LONDON) BOROUGH COUNCIL, May 6th.—Supply and installation of two lead batteries for Edison refuse collecting vehicles, having carrying capacity of 3½ to 4 tons. Further particulars from the Cleansing Superintendent, Liverpool Road, N.1.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(a) Main 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 1 500 000 kVA; (b) auxiliary 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 500 000 kVA, with group feeder reactors, for Ironbridge power station. Specification (No. 4) and form of tender from Mr. E. F. Hetherington, chief

Digitized by Google

engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(1) One 50 000 kW turbo-alternator, with step-up transformers, etc.; (2) condensing plant, boiler-feed pumps, evaporators, etc.; (3) circulating water pumps, etc., for Ironbridge power station. Specifications (No. 2) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 15th.—Conductor cords (No. P. and T., 151/1 319). (Reference B.X. 5 098.)

INDIAN STORES DEPARTMENT, April 16th (extension of time).—Supply of 30 kW steam engine driven generator set (order No. N. 9 538). (Reference B.X. 5 167.)

INDIAN STORES DEPARTMENT, April 16th.—Supply and erection of one 5-ton overhead electric three-motor gantry crane (order No. N. 9 536). (Reference A.X. 7 652.)

INDIAN STORES DEPARTMENT, April 16th.—Supply and erection of one 5-ton electric telpher (mono rail), with track (order No. N. 9 537). (Reference A.X. 7 653.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 17th.—Supply of copper earthplates (specification 133). Reference A.X. 7 556.)

UMTALI MUNICIPALITY, April 18th.—Supply of line sundries switchgear and transformers, in connection with extensions of electricity undertaking. (Reference B.X. 5 142.)

UMTALI MUNICIPALITY, April 18th.—Supply of 1 000 kW turbo-alternators, spray cooling plant, switchgear and crane (contract B). (Reference B.X. 5 145.)

IRISH FREE STATE ELECTRICITY SUPPLY BOARD, April 29th.—Supply and laying of 40 000 V cables in the county and city of Dublin. Specification, etc., from Mr. P. J. Dempsey, 60-62, Upper Mount Street, Dublin; deposit £5.

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

CAPETOWN MUNICIPALITY, May 1st.—Supply of 30 ft. steel poles, cross arms, insulators, fly fuses, etc. (specification 459/1929). (Reference A.X. 7 697.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 7th.—Supply of two electric motor driven centrifugal pumps. (Reference A.X. 7 738.)

STATE ELECTRICITY WORKS, MONTEVIDEO, May 6th.—Supply of electric cables and accessories. (Reference B.X. 5 178.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, May 15th.—Supply and erection at Government Printing Office, Cairo, of 120 kW d.c. Diesel electric generating set, with foundations, artesian well, electrically-driven water cooling pump, etc. Forms of tender, etc. (10s. 6d.), from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, May 15th.—Supply of 500 kW sub-station rectifier unit, arranged for automatic control, with necessary switchgear (contract 677). (Reference B.X. 5 206.)

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, May 15th.—Supply of sub-station units for automatic control, comprising two rotary converters of 1 000 kW and one of 500 kW (contract No. 678). (Reference B.X. 5 210.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, May 13th.—Supply and erection of synchronous condenser (contract 257, 28). (Reference B.X. 5 205.)

VICTORIAN RAILWAY COMMISSION, May 15th.—Supply of one geared three-phase electric winding engine (contract No. C.M. 778). (Reference A.X. 760.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, May 16th.—Supply and installation of electric signalling apparatus at Johannesburg. (Reference B.X. 5 165.)

BLOEMFONTEIN MUNICIPALITY, May 18th.—Supply and erection of (*a*) turbine and generator, condensing plant and auxiliaries and switchgear and cables; (*b*) cooling spray pond equipment, or cooling tower (contract No. 1). (Reference B.X. 5 192.)

PLOVDIFF (BULGARIA) PROVINCIAL COUNCIL, May 20th.—Supply of two Francis turbines, two 5 000 kVA generators, two 5 000 kVA, two 1 000 kVA and two 150 kVA transformers, for Votscha-Kricim power station.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 28th.—Supply of telephone jacks and number plates (schedule C. 417). (Reference B.X. 5 202.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-cored aluminium conductors. (Reference A.X. 7735.)

Tenders Accepted.

ADMIRALTY.—Edison Swan Electric Co., Ltd., accumulators.

PERTH CORPORATION.—M'Cowan and Guild, electric lighting work, in connection with erection of 96 houses at Hillyland, Darnhall and Riggs Road.

EASTBOURNE CORPORATION.—General Electric Co., Ltd., supply of switchgear, £3 504; Ferguson, Pailin, Ltd., supply of four single cubicles, £172.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Electric Construction Co., Ltd., erection of kiosk type sub-station at Ossulston Street, £388. (Recommended.)

SWEDISH TELEGRAPH BOARD.—Marconi's Wireless Telegraph Co., Ltd., equipment for new 60 kW broadcasting station, near Stockholm, Kr.400 000 (approximate).

IRISH FREE STATE LOCAL GOVERNMENT DEPARTMENT.—General Electric Co., Ltd., six months' supply of Osram metal filament, gasfilled and vacuum lamps, and Robertson carbon lamps.

WORTHING CORPORATION.—British Thomson-Houston Co., Ltd., converting plant, £5 710, and switchgear, £3 112; Callenders' Cable and Construction Co., Ltd., cable, £9 367, and overhead extension, £1 050.

BRADFORD CORPORATION.—English Electric Co., Ltd. Supply of six double-deck railless electric trolley vehicles, and certain spare parts, £12 768 14s., and one single-deck, railless electric trolley vehicle which has been used by the company for demonstration purposes, £990.

SHEFFIELD CORPORATION.—A. Reyrolle and Co., Ltd., supply of sub-station switchgear, £5 933 8s. 9d.; Metropolitan-Vickers Electrical Co., Ltd., thirty 300 kVA and six 450 kVA three-phase transformers, £6 384; British Electric Transformer Co., Ltd., six 250 kVA single-phase transformers and four 1 000 kVA Scott connected sets, £2 868.

BATTERSEA (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., supply of a 750 kW motor converter and automatic switchgear for Lavender Hill sub-station, £5 720; Callender's Cable and Construction Co., Ltd., supply of cables; Chamberlain and Hookham, Ltd., and Ferranti, Ltd., supply of meters, and Dussek Bitumen Co., Ltd., supply of bitumen, for 12 months. (All recommended.)

SHEFFIELD CORPORATION.—Stirling Boiler Co., Ltd., three 120 000 lb. boilers and accessories, £140 206; English Electric Co., Ltd., 25 000 kW turbo-alternator, and condensing plant, £94 413; Brightside Foundry and Engineering Co., Ltd., pipework and valves, £25 492; General Electric Co., Ltd., e.h.t. switchgear, £55 067; British Electric Transformer Co., Ltd., transformers, £5 008; Davenport Engineering Co., Ltd., cooling towers and tanks, £19 194; Mitchell Conveyor Co., Ltd., coal handling plant, £23 292; Isles, Ltd., cranes, £5 421; Mitchell Conveyor Co., Ltd., buildings and civil engineering works, £172 893.

MID-EAST ENGLAND ELECTRICITY SCHEME.

An order for the first generating unit for the new Blackburn Meadows station, which will operate under the Mid-East England electricity scheme, has just been placed with the ENGLISH ELECTRIC CO., who will manufacture the 35 000 H.P. multi-cylinder steam turbine at their Rugby works and the electric generator at Preston. The order is valued at nearly £100 000. The unit will have an output of 25 000 kW, will run at 3 000 r.p.m., and will be supplied complete with condensing plant. An "English Electric" shunting locomotive is also being supplied for the haulage of coal, ashes, etc.

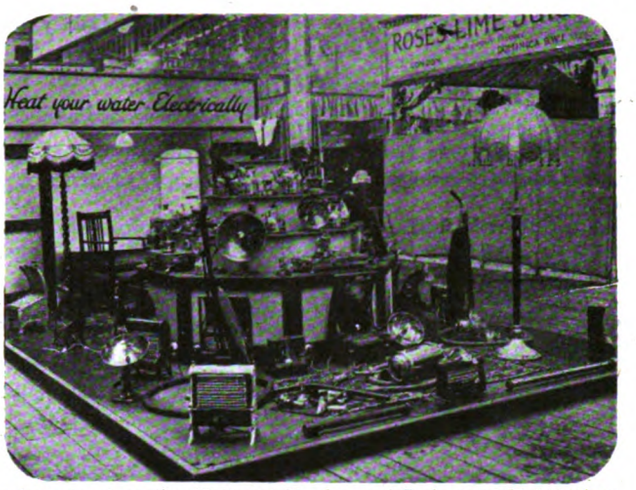
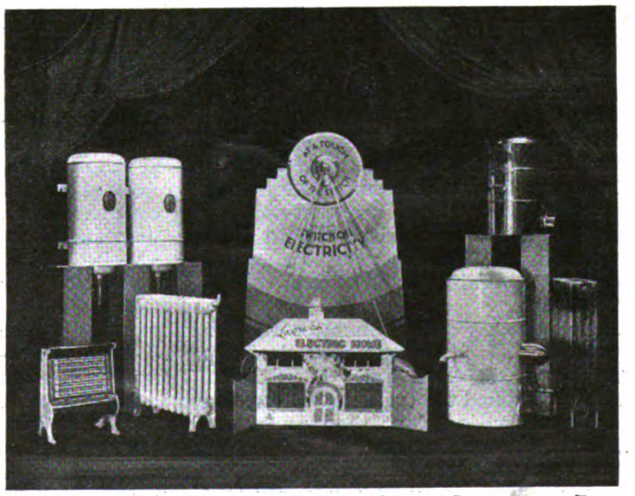
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



The Birmingham Electric Supply Department has a comprehensive stand at the National Trades and Industrial Exhibition which is being held at Bingley Hall, Birmingham, until May 11th. The display includes a large selection of heating, cooking and domestic labour-saving appliances, and special features are being made of water heaters, electric cookers as supplied on hire, and numerous new patterns of electric fires, vacuum cleaners, kettles, toasters, irons and fans. The cooker stand is shown above on the left, with the fires and appliances display on the right. The exhibit is, incidentally, of special interest in view of the April Selling Campaign of the E.D.A., the window displays for which are shown below.

Work on the new lighting system for the Embankment, London, has already commenced, and above may be seen one of the old standard bases being removed in readiness for the new units. The original bases will be used to support the new poles and, wherever necessary, additional bases of the original design are to be made. When completed this will be one of the best lighted streets in London. See page 451.

Mr. S. E. Fedden, who has been appointed district engineer for Mid-East England, under the Central Electricity Board, will take up his new duties on May 1st. See page 450.



The alternative window displays which have been designed by the E.D.A. in connection with the April Selling Campaign. Part of the cube outfit used in previous months is again incorporated, and the story told by the displays advocates electricity as the ideal method of providing local heating during the chilly evenings of the spring and early summer months. The displays are of sizes which can be accommodated in practically every type of window, and their simple design permits of their being arranged without the special skill of a window dresser, while their colour and lighting schemes are sure to attract public attention. In addition to the usual stereos, etc., for local advertising, the Association has also prepared a special poster.

ELECTRICITY SUPPLY.

Rural Electricity Supply—Mains Extensions at Manchester—Croydon and 230 V Supplies—Proposals at Belfast—Supply Inaugurated at Rainford—New Turbo-Alternator Started at Bury St. Edmunds.

MANCHESTER Electricity Committee seeks sanction to borrow £100 000 in respect of service mains.

Tunbridge Wells T.C. has applied for a loan of £13 302 for mains, sub-station, sub-station pillars, etc.

Epsom U.D.C. is to negotiate with the London and Home Counties Joint Electricity Authority for a supply of electricity in bulk.

East Grinstead U.D.C. has adopted a scheme for supplying electricity to portions of the parishes of Lingfield, Tandridge, and Godstone.

Croydon Electricity Committee recommends the extension of the existing e.h.t. cable from Gibson's Hill Pillar to Ryecroft Road, at an estimated cost of £355.

Powers have been obtained by Chester Corporation to erect overhead lines to transmit at 6 600 V and 400 V, respectively, between Tarporley and Farndon.

It has been decided by Formby U.D.C. to seek borrowing powers for £6 500 with which to finance development work during the three years ending December 31st, 1931.

Having obtained permission to borrow £10 986 for mains, services, and plant, Lytham St. Annes T.C. proposes to extend its supply to Freckleton, Warton, and other districts.

Barnstaple R.D.C. has decided to consent to the Ilfracombe Electricity Co.'s application for a Special Order enabling it to supply Mortehoe, Berrynarbor and Combemartin.

Dublin electricity undertaking passed under the control of the Electricity Supply Board on April 4th. There was a charge balance to credit on the revenue account. See page 450.

Marsham U.D.C. has decided to dispose of its electricity undertaking to the Cleveland and Durham County Electric Power Co. from which a favourable offer has been received.

Belfast Electricity Committee proposes to spend about £77 000 on electrical extensions, and recommends that application be made to the Commissioners for a loan of that amount.

Hambledon R.D.C. is opposed to the proposal of the Aldershot Gas Water and District Lighting Co. to erect overhead cables across certain commons between Farnborough and Hindhead.

The public electricity supply at Rainford was inaugurated last week. The ceremony took place at the Village Hall, the exterior of which was electrically illuminated. The supply is given by St. Helens Corporation.

Barking Electricity Committee has approved a draft deed of transfer from Barking Council to the County of London Electric Supply Co., Ltd., of the right to supply electricity within an area of land adjoining the Barking Power station of the company.

Carlisle Electricity Committee has decided to apply for powers to extend the Corporation's supply area to embrace additional towns and villages, including Wetheral, Brampton and Longtown. The Electricity Commissioners have informed a deputation that they will agree to the proposal.

Inhabitants of Newport (Fife) complain of the failure of the Fife Tramways, Light and Power Co. to supply electricity in the burgh by December, 1928, in accordance with its Provisional Order. The T.C. has instructed the Town Clerk to communicate with the Secretary for Scotland on the matter.

Eastbourne Town Planning Committee has protested against the erection of overhead wires, in connection with the South East England electricity scheme, in country districts where it is considered that the rural scenery will be spoiled. The Electricity Committee is to obtain a site in Arundel Road for a sub-station.

A new 1 000 kW turbo-generator was officially started by the Mayor (Mr. S. J. M. Sampson) at the Bury St. Edmunds electricity works on April 5th. The British Thomson-Houston Co., Ltd., supplied the turbo-generator, Worthington-Simpson, Ltd., the condensing plant, the Premier Cooler and Engineering Co., Ltd., the cooling tower, and Herbert Morris, Ltd., a 10-ton overhead crane.

At a recent meeting of Tarleton ratepayers, convened by the West Lancashire R.D.C., it was decided to adopt an electric lighting scheme for the district, 161 residents having agreed to take a supply. It is proposed to take a bulk supply and to have underground mains, and the charges are to be 8d. per kWh for lighting, and 2½d. for power. It is also proposed to instal 100 lamps for street lighting.

Beckenham U.D.C. has applied for loans as follows:—Mains and services, £25 000; sub-stations, £5 000; sub-station switchgear, £2 000; and e.h.t. cable, £1 837. An agreement has been reached with the West Kent Electric Co. for a partial supply of electricity in bulk. It is proposed to have electricity offices and showrooms erected.

Chester City Council has decided to apply £1 500 out of the revenue of the electricity department to relief of rates. Mr. C. Crosland Taylor, chairman of the Electricity Committee, has reminded the Council that there is only one more year in which the department can subscribe money towards the rates, because the reserve fund is not what it should be.

Stoke-on-Trent Electricity Committee has obtained sanction to borrow £18 000 for works required in connection with the supply of electricity to Leek.—The Committee seeks sanction for loans of £900 in connection with supply to Stone Road, Trentham; £1 200 in connection with supply to Trent and New Wharf Potteries, Burslem; £2 000 in respect of supply to Fegg Hayes and £1 200 in respect of supply to Lytton Street and High Street West, Fenton.

Sheffield Electricity Committee has authorised mains extensions at a cost of £11 265. The Committee has obtained sites for sub-stations at Norton Lees Road and Rushley Road, Dore. In view of the new rating assessments, the Electricity Committee recommends that in the case of domestic supplies the amended assessments shall be the basis for calculation for the fixed charge per annum under the inclusive domestic rate, and that the fixed charge per annum shall be one-twelfth of the net assessment for rateable value, divided into four quarterly payments.

Croydon Corporation is recommended to purchase a 1 000 kVA Scott-connected oil-cooled transformer and an oil switch, at an estimated cost of £730. It is proposed to continue the work of standardisation of pressure in the borough to 230 V by conversion in various districts at an estimated cost of £5 000. The Electricity Committee proposes the erection and changeover of street lamps at an estimated cost of £310; and mains extensions at £648.

A scheme for demonstrating the practicability of electricity supply in rural areas, embracing the experiences of the Chester undertaking and the S.W.S. Power Co., has been prepared for operation in part of the area served by Bedford Corporation. It is intended to lay mains in the area concerned and to then invite the inhabitants to avail themselves of the service offered. The scheme, supported by the Electricity Commissioners, the Ministry of Transport, the Ministry of Agriculture, and several electricity undertakings, including those named above, will probably be subsidised by the Treasury until it becomes self supporting.

Mr. A. D. Erskine held a Ministry of Transport inquiry last week into the application of the Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co. to continue an overhead line from the works of the East Anglian Cement Co. at Shepreth to Harston. The Cement Co. refused consent unless they were compensated, and urged that the present cable was intended for the supply of electricity for power only to themselves. The company did not object to the cable being extended for lighting purposes, but objected to the extension in order to supply power to the Great Portland Cement Works and the Barrington Cement Works. Mr. S. S. Scott, for the electricity company, said they were under statutory obligation to supply the other cement companies, and they were not prepared to consider the question of compensation.

Sir W. F. Marwood, on behalf of the Ministry of Transport, held an inquiry on Monday into the application of Luton Corporation for a compulsory wayleave for an overhead electric cable from a point on the Icknield Way to the new estate of the Zoological Society at Whipsnade. Dr. P. Chalmers Mitchell, secretary of the Society, said the supply was an urgent necessity. A water reservoir had to be accepted on completion without test and pumping machinery paid for, although useless at present, because there was no power to operate the pumping plant and fill the reservoir. He could not recommend the society to spend money on putting a cable underground on other people's property. The proposal to erect an overhead line was opposed by members of the local committee of the National Trust and some local farmers.

COMPANY NEWS.

Electrical Descriptions Mainly Quiet—Telegraph Stocks Improve—Supply Shares Unsteady—Wireless Telegraph Holdings Advance, while Traction Stocks also Show Improvement.

THE electrical share market has continued quiet, some little demand for manufacturing shares leaving price quotations unchanged except for General Electric ordinary, which have further recovered to £3. The only feature elsewhere was the buying of Eastern Telegraph ordinary stock, which at 282½ is 15 points up on the week. Other telegraph stocks show a small improvement, and Marconi's Wireless shares are half-a-crown higher at 86s. 3d. County of London supply shares have eased a shilling, and Metropolitan Railway ordinary stock is slightly better.

Fin. div. on ord. shs. 7%, makg. 10% for year. Fwd. £364 209. Electricity sold 323 462 637 kWh, increase 75 151 048.

LLANDUDNO AND COLWYN BAY ELECTRIC RAILWAY, LTD. Traffic receipts for 1928, £20 663, decrease £1 842. Deficit for year £1 153. Proposed reconstructn. of a sectn. of track in the Colwyn Bay area, in conjunctn. with works which Colwyn Bay Ccl. proposes to carry out at the same point, has not been proceeded with, owing to attitude of Ccl. Co. still experiences difficulty in makg. reasonable arrangemnts. with Colwyn Bay Ccl., and loss of rev. due to bus competitn. accts. for unsatisfactory result of year's workg.

A. REYROLLE AND CO., LTD.—Pft. for 1928, £90 615, agst. £89 306, plus £65 430. Distributed among local charitable and other funds, £1 000. Div. on pref. shs., 7% p.a., of which intm. div. was paid in Sept., 1928; div. on ord. shs., 12½% p.a.; to res. for gen. purposes. £25 000. Fwd. £78 892, agst. £65 430. Output of co.'s mfres. was greater than in 1927. Staff pensn. fund was inaugurated on July 1, 1928, and £30 326 was paid to trustees, being co.'s contributn. in respect of employees' service prior to that date.

BRITISH ENGINE, BOILER AND ELECTRICAL INSURANCE CO., LTD.—Intm. div. of 14s. p. sh., less tax, was paid on June 30, 1928. After transferring £20 000 to pensn. fund and £10 000 to res. fund, blce. is £20 544. Directors recommend paymt. of fin. div. of 15s. p. sh., less tax, absorbing £12 240. During 1928, 2s. p. sh. was called up, resultg. in additn. of £40 800 to paid up cap., and a correspondg. sum was

Digitized by Google

transferred from contingency fund by way of bonus div. Bonus to staff and other jubilee expenditure amtd. to £5 534, leavg. blce. in contingency fund of £3 666, which has been transferred to gen. res.

ELECTRIC FURNACE CO., LTD.—In a statemt. issued to comply with the requiremts. of the Stock Exchange, it is announced that the whole of the issued 80 007 pfd. ord. and 78 036 ord. shs. of £1 each are fully paid. As co. was only incorporated on Aug. 23, 1928, no divs. have yet been paid. Hldrs. of pfd. ord. shs. are entitled to fixed cum. preferential div. at rate of 7% p.a. Surplus pfts. which it is determined to distribute are applied as follows: 1st, a div. of 7% p.a. on ord. shs.; 2nd, a div. of 3% p.a. on all shs., whether pfd. ord. or ord. Particulars are also given of the constitutn. and objects of the co. and arrangements made with other cos. in regard to interchange of patents and experience, etc.

CABLES AND WIRELESS MERGER.—Definite informatn. is now available regarding the offer of the scrip of the new merger co., Cables and Wireless, Ltd., to stkhldrs. and shhldrs. in the Eastern and Associated Telegraph Companies and Marconi's Wireless Telegraph Co., Ltd. Hldrs. of Eastern Telegraph stk. will be offered for every £100 now held £299 18s. in three classes of stk. of the new co. (£165 of 5½% cum. pref. £1 shs., £108 18s. of 7½% non-cum. "A" £1 ord. shs., and £26 of "B" £1 ord. shs.); and hldrs. of Eastern Extension shs. and Western Telegraph shs. will receive a similar allotment for ea. £100 nom. of £10 ord. shs. Marconi's Wireless Telegraph Co. shhldrs. will be offered for ea. £100 nom. of 7% cum. participatg. pref. shs. of £1 ea., or for each £100 nom. of £1 ord. shs., £131 10s. of 5½% cum. pref. £1 shs., £205 8s. of 7½% non-cum. "A" £1 ord. shs., and £150 5s. of "B" £1 ord. shs; and hldrs. of Marconi 10s. shs. will be offered for ea. £50 nom. of 10s. ord. shs. £81 10s. of 5½% £1 cum. pref. shs., £205 8s. of 7½% non-cum. "A" £1 ord. shs., and £150 5s. of "B" £1 ord. shs. Not more than 25% of the shs. of any class may be held by foreigners. On April 8, Cables and Wireless, Ltd., and Imperial and International Communications, Ltd., were registered as public companies. The former, wh is formed to acquire the securities of the cable cos. and the Marconi Co., has nom. cap. of £100, with power to increase same to £53 000 000, and the latter (the Imperial and International Co.), formed to acquire the undertakings, assets, obligations, etc., of the same companies, also has nom. cap. of £100. The directors of Cables and Wireless, Ltd., are: Sir Chas. S. Addis, Mr. Fredk. R. S. Balfour, Sir Chas. C. Barrie, Sir Fredk. J. Barthorpe, the Earl of Bessborough, Sir Basil P. Blackett, Col. Arthur G. Broderick, the Earl of Clarendon, Mr. John C. Denison-Pender, Admiral Henry W. Grant, Mr. Henry C. Hambo, Viscount Inchcape, Lord Inverforth, Mr. Francis A. Johnston, Mr. Fredk. G. Kellaway, Major H. Lefroy, Senatore G. Marconi, the Earl of Middleton, Mr. John F. O'Malley, Mr. Geo. Peel, Dr. Lorcan G. Sherlock, and Lord Wester Wemys; Lord Inverforth being president, Mr. J. C. Denison-Pender governor and managing director, and Mr. F. G. Kellaway deputy-governor and managing director. The personnel of the court of directors of Imperial and International Communications, Ltd., is the same, but Sir B. P. Blackett is chairman, and Mr. J. C. Denison-Pender and Mr. F. G. Kellaway are managing directors. Mr. Edward Wilshaw is manager and secretary of both companies.

Company Meetings.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION, LTD.—Mr. D. Sinclair, presiding at the recent meeting, said the profit for the past year amounted to £154 460, an apparent decrease of £40 462. These figures, however, were not a true comparison, as the company in 1927 owned the generating station at Ocker Hill. After making the necessary adjustments the financial result was very little different from the previous year. It was as yet too early to estimate the effect of purchasing all their supplies, as the interlinking of the various generating stations was not completed. The directors recommended a final dividend of 5%, making 8% for the year, and it was proposed to carry forward £24 549. An Order to extend the company's area to Swindon, Seisdon, Trysull, Bobbington and Claverley was confirmed on March 11th.

MERSEY POWER CO., LTD.—At the recent general meeting, Mr. George Henry Cox, chairman, said although the company was registered in 1911 this was its first public meeting, none of the share capital having been made available to the public prior to last autumn. Since their previous report, the share capital had been increased by £700 000, making the authorised capital £1 050 000, of which £1 046 475 had been issued. This increase of share capital had enabled them to pay off all the mortgages and loans, with the exception of £200 000 lent under the Trade Facilities Act on favourable terms. Working profit was £100 869, compared with £87 660 for 1927, and net profit was £64 169, against £52 144. It was proposed to pay a dividend of 5% on the ordinary shares, to place to depreciation reserve £30 000, and carry forward £17 080. The prospects of the company continued to be good. Their Percival Lane station was to become a selected station under the North-West England scheme.

The Clyde Valley Co.'s Prices.

CLYDE VALLEY ELECTRICAL POWER CO.—Sir Fredk. C. Gardiner, presiding at the meeting on April 3rd, said, having regard to the prevailing conditions, he thought the shareholders would agree that the result of the year's working was satisfactory. They had carried £120 000 to contingency fund, and they recommended that £30 000 be set aside for establishing a fund for staff pensions, etc. Receipts from sale of current had increased by approximately £32 000. They were enabled to carry £303 000 to net revenue account, and, subject to the recommendations they made being adopted, they carried forward £84 500. Their output for last year (240 000 000 kWh) was 21 000 000 higher than 1927. They were installing a 20 000 kW turbo-alternator at Yoker, to operate at 50 cycles. The recent readjustment of the company's domestic and shop rates was made in order to reach, if possible, relative uniformity. The changes proposed involved a reduction in revenue of about £5 000. They were designed to give an advantage to consumers who made full use of electricity for domestic purposes. They granted the option to all consumers to continue on the then existing basis of charge or to adopt the new basis. Already a large number had accepted the new proposals. Their average rate per kWh sold for the year was 0·749d., and combined average rate received by the company and its the subsidiaries from power, shops, and domestic consumers was 0·828d. These rates were lower than in the previous year. Moreover, they were lower than any other undertaking in Scotland, and there were few undertakings in the United Kingdom selling at so low an average price. The report and accounts were adopted, and payment of the 6% preference share dividend for the half years ending April 30th and October 31st, 1929, and the 8% 2nd preference share dividend for the half years ending June 30th and December 31st, 1929, was approved.

A. REYROLLE AND CO., LTD.—Mr. A. Scholefield, presiding at the meeting on April 4th, said two years ago their chairman, when addressing them, referred to the Electricity Act, 1926, by which supplies of electricity would be provided throughout the country, and he stated that he hoped in due course they would receive some share of the work. They did receive a large contract, one of the largest single orders which he believed had ever been placed in this country for switchgear only, in connection with the South-Eastern scheme. They had also received several smaller orders connected with the work of the Electricity Board in other districts. Their turnover during the year had been higher than ever before, and a considerable portion of it still represented switchgear exported to the colonies and elsewhere abroad. A contribution of £28 000 had been set aside for the staff superannuation scheme. A sum of £1 000 was voted to local charitable and other funds. The report and accounts were adopted, and dividends of 7% on the preference and 12½% on the ordinary shares were approved.

ERICSSON TELEPHONES, LTD.—Mr. W. M. Crowe, presiding at the meeting on April 3rd, said the net profit for the past year was some £4 000, or approximately 15%, better than the previous year, and the prospects were that the current year would show still better results. During last year and since the beginning of the present year they had received some large orders for automatic equipment, as well as for general material and manual exchanges. They had completed for the Post Office at Bath an automatic exchange with two satellite exchanges, and had orders for automatic exchanges at Walsall, Aldridge and Bloxwich. The installation at Shepherd's Bush had already commenced. Further automatic exchanges in hand were Crewe and Nantwich and "Gladstone," in the London area. Orders had also been secured for private automatic exchanges throughout this country and also abroad. It was proposed to pay the dividend on the 7% preference shares, 5%, less tax, to the ordinary shareholders, to place £5 000 to general reserve, and carry forward £18 236. The report was adopted.

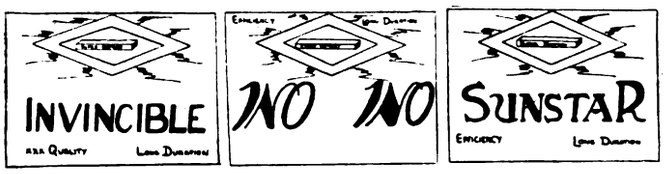
ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

SARE.—498 495. Class 8. Scientific instruments and apparatus. P. Kay, Ltd., 183, Old Street, London, E.C.2; merchants. December 27th, 1928. (To be associated with No. 498 496 and others (not yet advertised)).



Illustrating Marks 494 477, 494 478 and 494 479 reading from left to right.

LIMPET TAPE.—B496 270. Class 50. Electric insulating tape composed of cotton impregnated with india-rubber. Connollys (Blackley), Ltd., Blackley Vale Mills, Blackley, Manchester; cable manufacturers. October 24th, 1928. User claimed rom June 24th, 1925.

Opposition to the registration of the following trade marks can be lodged up to April 20th.

CLAROSTAT.—492 651. Class 8. Variable electrical resistances. Claude Lyons, Ltd., Old Hall Chambers, 76, Old Hall Street, Liverpool; manufacturers. June 23rd, 1928.

OBERON.—494 056. Class 8. Scientific instruments and apparatus. The Parlophone Co., Ltd., 1, Broad Street Place, London, E.C.2; manufacturers. August 13th, 1928.

SAREZITE.—498 496. Class 8. Scientific instruments and apparatus. P. Kay, Ltd., 183, Old Street, London, E.C.2; merchants. December 27th, 1928. (To be associated with No. 498 495 (2 659).)

SUNBEAM.—484 296.—Class 18. Electric lighting, power and ignition sets, all being parts of motor cars and other motor vehicles (except motor cycles and sidecars). The Sunbeam Motor Car Co., Ltd., Moorfield Works, Upper Villiers Street, Wolverhampton; manufacturers. September 24th, 1927. (To be associated with No. 484 297 (2,622) xxii and another.)

Opposition to the registration of the following trade marks can be lodged up to April 27th.

BUSY BEE.—497 618. Class 6. Electric vacuum cleaning machines. Drake and Gorham Wholesale, Ltd., 67, Long Acre, London, W.C.2; merchants. November 30th, 1928.

CHARIDE.—495 130. Class 8. Wireless telephonic instruments. Rupert May, 48, Canning Road, Croydon; manufacturer. September 18th, 1928.

IGRANOPHONE.—499 862. Class 8. Wireless telephonic apparatus in combination with gramophones and parts thereof. Igranic Electric Co., Ltd., 147, Queen Victoria Street, London, E.C.4; electrical engineers. February 8th, 1929. To be associated with No. 254 366 (1 316) and others.

OKOSCOPE. (Sign).—499 913. Class 8. Electrical resistances, fitted electrical switchboards, and electric accumulators (not for medical purposes). Okoscope and Camera Developments, Ltd., 10, Lancaster Place, London, W.C.2; dealers in scientific instruments. February 11th, 1929.

ETA.—497 286. Class 13. Electrical switches, electrical fusible cut-outs and electrical contact plugs, all being metal goods. Siemens-Schuckertwerke Aktiengesellschaft, 101 to 110, Nonnendamm-Allee, Berlin-Siemensstadt, Germany; manufacturers. November 21st, 1928.

TWELCO.—496 912. Class 13. Electric lamps (ordinary). John Massey Fairhurst, trading as The Western Electric Lamp Co., 122, Royal Exchange, Manchester; merchant. November 10th, 1928.

Opposition to the registration of the following trade marks can be lodged up to May 3rd.

494 477. Class 8. Electric batteries (not for medical purposes). August 27th, 1928. To be associated with No. 494 478 (2 662) and another. Registration of this trade mark shall give no right to the exclusive use of the letters "X X X," or of the word "Super" or of the device of an electric battery. 494 478. Class 8. Electric batteries (not for medical purposes). August 27th, 1928. To be associated with No. 494 477 (2 662) and another. Registration of this trade mark shall give no right to the exclusive use of the word "Super" or of the device of an electric battery. 494 479. Class 8. Electric batteries (not for medical purposes). Gas Light Fittings Co., Ltd., 322, Walworth Road, London, S.E.17; electrical and gas engineers. August 27th, 1928. To be associated with No. 494 477 (2 662) and another. Registration of this trade mark shall give no right to the exclusive use of the word "Super" or of the device of an electric battery.

DISTASET.—497 574. Class 8. Wireless telephonic apparatus. Truphonic, Ltd., Truphonic House, 121 and 123, Roseberry Avenue, London, E.C.1; manufacturers. November 29, 1928. (By consent.)

POLYFAR.—499 193. Class 8. Wireless telephonic and telegraphic apparatus, and parts thereof. Polyphonwerke Aktiengesellschaft, 76, Markgrafenstrasse, Berlin, S.W.68; manufacturers. January 19th, 1929. To be associated with No. 350 747 (1 833) and others.

GOTHIC.—500 032. Class 8. Loud speakers. M.P.A. Wireless, Ltd., 62, Conduit Street, Regent Street, London, W.1; manufacturers. February 14th, 1929.

OSRAM.—498 860. Class 8. Apparatus and parts thereof for use in connection with television and telegraphy. The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2; manufacturing electrical engineers. January 9th, 1929. To be associated with No. 330 828 (1 726) and others.

KELSTOM (sign). 499 987. Class 8. Instruments and apparatus for use in wireless telegraphy and telephony. Kells and Thompson, 100, George Street, Portman Square, London, W.1; manufacturers and merchants. February 13th, 1929.

THE LEAD MARKET.

Prices were, before Easter, according to James Forster and Co., a little firmer. After the holidays a firm tone was still in evidence, but on the Thursday a break occurred, prices falling from £26 15s. to £24 10s. for all positions. The American price was marked down to 7.50 cents per lb.

Closing prices on April 5th were £24 10s. for all positions, against £28 13s. 9d. to £29 a fortnight ago.

IMPERIAL TRAMWAYS CO., LTD.—After payment of deb. int. and pref. div. for 1928, div. of 5%, less tax, on ord. shs. is proposed. Fwd. £878.

NEW COMPANIES.

GRANGE ELECTRICAL AND RADIO SERVICES, LTD.—Cap., £1 000, Electricians, etc. Reg. office: 1, Grange Road, Edinburgh.

FRED HARTLEY, LTD.—Cap., £500. Electrical and mechanical engineers, etc. A director: F. Hartley, 7, Sunnyroyd Terrace, Colne.

A. E. MORRISON AND SONS, LTD.—Cap., £10 000. Electricians, electrical and general engineers, etc. Reg. Office: Gartree Street, Leicester.

NELSON BROTHERS, LTD.—Cap., £2 000. Electricians, manufacturers of and dealers in electricity, etc. Reg. office: 2, Regent Road, Blackpool.

MAVOR AND COULSON (SOUTH AFRICA), LTD.—Cap., £10 000. Engineers and electricians, etc. Reg. Office: 47, Redan Street, Mile End, Glasgow.

N. M. CLOUGHER AND CO., LTD.—Cap., £5 000. Electrical engineers, contractors, etc. A director: N. M. Clougher, 28, Craven Street, London, W.C.2.

J. LEWTAS, LTD.—Cap., £10. Manufacturers, merchants and factors of lamps, electric lighting goods, etc. Reg. Office: 22, Little Peter Street, Manchester.

SNAP SWITCHES, LTD.—Cap., £100. Manufacturers of wireless equipment, electrical and general engineers, etc. Reg. Office: 17, Mason's Hill, Bromley, Kent.

IOLA (RADIO-GRAM), LTD.—Cap., £400. Manufacturers, factors nd distributors of wireless receivers and instruments, etc. Reg. Office: 60, Chiswell Street, London, E.C.2.

EMERALD WELDING CO., LTD.—Cap., £100. Welders by electric arc, electric resistance, or other processes, etc. Reg. office: 21a, Brownlow Mews, Guilford Street, London, W.C.1.

BELLFREY, LTD.—Cap., £300. Manufacturers of and dealers in electrical, telegraphic, telephonic and wireless instruments, etc. Reg. Office: 9, Brunswick Place, City Road, London, N.1.

MOSS AND SMITH, LTD.—Cap., £10 000. To acquire business of wireless factors and importers, etc., carried on by W. Moss and W. M. Smith as Moss and Smith at Kensington House, Bolton.

TRUSLOVES, LTD.—Cap., £50 000. To acquire business of pump manufacturer, electrical engineer, etc., carried on by A. Webb as Truslove and Co. Reg. Office: 17, Victoria Street, Westminster, S.W.1.

MULTIDOOR, LTD.—Cap., £200 000. Manufacturers of and dealers in automatic machines, electricians, etc. Solicitors: Kenneth Brown Baker, Baker, Lennox House, Norfolk Street, London, W.C.2. (Public Co.)

ROTOR SIGNS (ENGLAND), LTD.—Cap. £5 000. To adopt an agreement with T. H. Read, and to develop and turn to account the patents referred to therein. Reg. office: 4, Dove Court, Old Jewry, London, E.C.

LATTIN ELECTRICAL PRODUCTS, LTD.—Cap., £3 500. Manufacturers and distributors of electric heating and cooking apparatus, electrical engineers, etc. Reg. Office: Alexandra Works, Limes Road, Croydon.

PERKINS AND POWELL, LTD.—Cap., £7 000. To acquire business carried on as "Perkins and Powell," at 2, 3, 4 and 5, Bartholomew Row, Birmingham, and to carry on business of manufacturers of electrical fittings, etc.

METAL AND CHEMICAL PRICES.

TUESDAY, April 9th.

		Price.	Inc.	Dec.
Copper—

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ARNOLD, H., AND SON, Chequers Inn, Stowe Street, Lichfield, electrical contractors. £14 8s. 4d. February 27th.

ASSOCIATED ELECTRICAL SERVICES, 84, Eden Street, Kingston-on-Thames, electrical engineers. £10 14s. 11d. February 1st.

CLARKE, Mr., 149, Seabank Road, New Brighton, wireless dealer. £17 11s. 9d. February 21st.

EDGINGTON, Henry John H., and OXLAND, William Henry (trading as WESTERN TRADING SYNDICATE), 34, Chapel Street, Plymouth, wireless engineers. £28 19s. February 19th.

ELECTRADIO CO., LTD., 25, Westbourne Grove, W., electrical engineers. £15 2s. 10d. February 1st.

HARRIS (A. and B.), LTD., 47, Victoria Street, S.W., electrical engineers. £20 15s. 10d., February 4th; and £14 17s. 4d. February 26th.

HINE, Mr. G., 17, The Promenade, Church End, Finchley, wireless engineer. £15 0s. 7d. February 20th.

HONEYMAN, Mr. V. L., 825, High Road, Leytonstone, electrical engineer. £15 0s. 6d. February.

HOWSON AND CO., 2, The Facade, High Road, Goodmayes, electricians. £17 10s. 8d. February 20th.

PAMPHILION, Charles, 54, Blackhorse Lane, Walthamstow, electrical engineer. £28 2s. 10d. February 15th.

PIRIE, Mr. S. R., 9, Arlington Street, Piccadilly, W., electrical engineer. £18 8s. 10d. January 29th.

WENDER BROS., 66, Georges Road, Holloway, electricians £101 3s. January 18th.

Receivership.

MACKAY (WESTCLIFF-ON-SEA), LTD. E. G. White, of 77, High Street, Southend-on-Sea, was appointed receiver and manager on March 21st, 1929, under powers contained in debenture dated May 5th, 1926.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *— allowed by the date of the Summary, but such total may have been reduced.*]

BORDER ELECTRICAL FACTORING CO., LTD., Carlisle.—Registered March 20th, mortgage to Bank; charged on land and buildings in Collier Lane and Doughalls Court, Carlisle, etc.

KING (C. B.) (MAGNETOS), LTD., London, W. Registered March 14th, £1 100 debentures; general charge. *——. December 31st, 1928.

ROYCE, LTD., Manchester, electricians.—Registered March 20th, debenture for £5 000 and further advances to F. H. Royce, Elmstead, West Whittering; general charge. *£26 294. September 14th, 1928.

SIMMONDS AND STOKES, LTD., London, W.C., electricians.—Registered March 19th, £200 2nd debentures (2nd series) and £1 100 3rd debentures parts of £2 000 and £3 000; general charge. *£3 550. February 14th, 1929.

VOLTRON CO., LTD., Ponders End, wireless manufacturers.—Registered March 18th, £2 500 debenture, to Mrs. B. Ricketts, 14, Queen Anne Street, W.; general charge. *——. December 31st, 1928.

Satisfactions.

BRIDGWATER AND DISTRICT ELECTRIC SUPPLY AND TRACTION CO., LTD.—Satisfactions registered March 21st, £5 000, registered September 5th, 1922, and £2 150, registered May 4th, 1924.

ENGLISH ELECTRIC CO., LTD., London, W.C. Satisfaction registered March 14th, £43 600, part of amount registered October 3rd, 1919.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

COCHRAN, Samuel King Young, wireless dealer, trading as the POPULAR WIRELESS STORES, 26, Moorfields, and 3, Byrom Street, Liverpool. A meeting of the creditors of the above was held on April 5th at the offices of Mr. Parkin S. Booth, accountant and auditor, 2, Bixteth Street, Liverpool, when the representative of the Chorlton Metal Co. was elected to the chair. The statement of affairs submitted showed ranking liabilities of £893 (trade creditors £669, cash claims £174, and bank overdraft £50), and assets of £330, less £150, or a deficiency of £713. Mr. Booth reported that the debtor commenced trading on his own account at 26, Moorfields, with a capital of £350, the whole of which was borrowed and was still owing. The business was satisfactory, and in February last the debtor opened a branch shop at Byrom Street. The rent at Moorfields was £180 per annum with rates of £130 yearly. The takings at that establishment had ranged from £50 to £60 per week. The rent at Byrom Street was £3 weekly, and the takings there had only averaged from £5 to £6 a week. The debtor's drawings had been at the rate of £6 a week. After a short discussion, a resolution was passed confirming the deed of assignment already executed to Mr. Booth and a committee of three of the creditors was appointed. It was also decided that the debtor should be given 14 days in which to submit an offer of a composition.

KLEIN BROS., LTD., wireless, etc., merchants, Bishopsgate, London, E.C. At the statutory meeting of creditors in the voluntary liquidation of this company the statement of affairs, as at March 14th last, disclosed total liabilities of £4 096, of which £3 654 was due to unsecured creditors; there were bills payable of £263, and £179 was owing to the directors. There were also debentures for £2 500 secured upon the assets of the company. The assets, including stock in trade, etc., as a going concern, £1 125, and book debts £893, totalled £2 028, and there is consequently nothing available to meet the claims of the unsecured creditors.

NEW STANDARD WIRELESS VALVE CO., LTD. This company, now in voluntary liquidation by reason of its liabilities, was only registered so recently as August last. Its directors, according to the latest official return, are Harry Worrall, holding 101 shares, Henry Shephard, with 100 shares, and William Shephard, 100 shares; four other shareholders with 60 shares, bringing the total number in issue to 381, out of an authorised capital of £500 in £1 shares.

London Gazette, etc.

Companies Winding-up Voluntarily.

ASHWORTH AND SMITH (ELECTRICAL SUPPLIES), LTD. By reason of its liabilities, March 26th. B. H. B. Eldridge, 52, Brown Street, Manchester, chartered accountant, appointed as liquidator. Meeting of creditors at the offices of the Manchester Chartered Accountants' Society, 60, Spring Gardens, Manchester, at 3 p.m., Tuesday, April 16th.

CERTAX, LTD. By Special Resolution, March 15th, confirmed April 3rd. W. Elles-Hill, Chartered Accountant, 41, Bedford Square, W.C.1, appointed as liquidator.

NEW STANDARD WIRELESS VALVE CO., LTD. By reason of its liabilities, March 23rd. J. Hedley Janes, incorporated accountant, 27, New Hall Street, Macclesfield, appointed as liquidator,

OXFORD WIRELESS TELEPHONY CO., LTD. By Special Resolutions, March 13th, confirmed March 28th. E. R. White, 55, Cornmarket Street, Oxford, Chartered Accountant, appointed as liquidator. Meeting of creditors at liquidator's office, Thursday, April 18th, at 11 a.m.

Bankruptcy Information.

RICHARDS, Stanley Wyndham, of the Blackwood Radio and Electric Supply Depot, High Street, Blackwood, Monmouthshire, radio engineer and electrical contractor. Receiving order, April 3rd. Debtor's petition. First meeting, April 19th, 12.30 p.m., 34, Park Place, Cardiff. Public examination, May 23rd, 2.30 p.m., Town Hall, Tredegar.

SMITH, Leonard John, 3, Lower King's Road, Berkhamsted, electrical, radio and cycle engineer. Receiving order, April 2nd, Debtor's petition.

Notice of Dividend.

WALLIS, Cyril Kenneth, Bedford Street, and then at Longford Road, Bognor, Sussex, electrical engineer. Supplemental dividend 3s. 8d. per £, payable April 12th, Official Receiver's office, 12A, Marlborough Place, Brighton.

Notices of Intended Dividends.

HYDE, Hubert Algernon, 2, East Street, Bromley, Kent, wireless dealer. Last day for receiving proofs, April 20th. Trustee, T. Gourlay, 29, Russell Square, London, W.C.1. Official Receiver.

LAY, Oliver Cecil, 83, Burntwood Lane, Wandsworth, London, accumulator specialist, trading as the HOME WIRELESS INSTALLATION CO. at 2 (c) and 2 (d) High Street, Wandsworth, London. Last day for receiving proofs, April 20th. Trustee, T. Gourlay, 29, Russell Square, London, W.C.1, Official Receiver.

SCOTT, Montagu James, 134, Regent Street, Middlesex, trading as MONTAGU J. SCOTT AND CO., electrical engineer and contractor, lately at 100, Jermyn Street, Middlesex. Last day for receiving proofs, April 20th. Trustee, D. Williams, Official Receiver, Bankruptcy Buildings, Carey Street, London, W.C.2.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

306 194 British Thomson-Houston Co., Ltd. and C. G. Mayo. Electric transformers. (29/8/27.)
277 991 C. E. Bennett. Electric fuses. (23/9/26.)
306 574 W. W. Whiffin. Delay-action mechanism for electrical switches, gas cocks, or the like. (18/11/27.)
280 948 G. Valensi. Low-pressure electric discharge apparatus. (18/11/26.)
306 470 A. Reyrolle and Co., Ltd. and B. H. Leeson. Electric vibratory relays. (19/11/27.)
306 436 C. Flannagan. Circuit arrangements for thermionic devices. (19/11/27.)
292 455 G. Valensi. Low-pressure electric discharge apparatus. (17/6/27.)
306 580 G. M. Wright. Constant-frequency control devices suitable for use in picture telegraphy. (22/11/27.)
306 500 H. A. Ewen. Apparatus for supplying power to the anodes of thermionic valves. (22/11/27.)
306 583 J. Shaw. Apparatus for the application of the constant electrical current in medical practice. (23/11/27.)
306 584 W. E. Beatty (Bell Telephone Laboratories, Inc.). Wire-drawing apparatus. (23/11/27.)
281 297 Siemens and Halske Akt.-Ges. Telephone systems. (24/11/26.)
287 515 Associated Telephone and Telegraph Co. Telephone systems. (23/3/27.)
306 592 Automatic Telephone Manufacturing Co., Ltd. and C. E. Beale. Telephone systems. (23/11/27.)
306 612 General Electric Co., Ltd., F. J. G. Van Den Bosch, and N. R. Campbell. Manufacture of gasfilled electric incandescent lamps. (28/11/27.)
306 626 J. K. Im Thurn and T. H. Baines. Constant-voltage dynamo-electric machinery. (1/12/27.)
289 846 C. Meyer. Automatic circuit-breaker arrangements for the protection of electric generators. (4/5/27.)
306 659 General Electric Co., Ltd., F. G. Quance and T. C. Freeth. Devices for taking up or absorbing cords or the like flexible bodies. (30/12/27.)
306 661 General Electric Co., Ltd. and J. R. Conchie. Electric bells. (3/1/28.)
306 662 W. C. Kennett and Hackbridge Electric Construction Co., Ltd. Electric transformers. (3/1/28.)
306 663 Tyer and Co., Ltd. and F. W. Leake. Selective switching-devices for electric circuits. (4/1/28.)
306 664 G. D. Peters and Co., Ltd. and H. R. Hockley. Tramcars and similar vehicles. (6/1/28.)
306 683 Siemens Bros. and Co., Ltd. and D. A. Christian. Sending or controlling apparatus set by electrical impulses. (7/2/28.)
306 707 N. R. Davis and Metropolitan-Vickers Electrical Co., Ltd. Electrical induction furnaces. (23/2/28.)
306 726 G. H. Fletcher, R. Brooks and Metropolitan-Vickers Electrical Co., Ltd. Electric motor control systems. (9/3/28.)
306 749 Birmingham Electric Furnaces, Ltd. and A. G. Lobley. Electrical gear for operating furnace and like doors. (5/4/28.)
289 816 L. M. Ericsson Telefonaktiebolaget. Automatic and semi-automatic telephone systems. (2/5/27.)
306 772 H. C. Compaan. Current motors and propellers. (5/6/28.)
292 469 Westinghouse Electric and Manufacturing Co. Radio-transmitting systems. (18/6/27.)
306 785 Weldrics (1922), Ltd. and A. D. Anderson. Electrodes for arc-welding and like purposes. (17/7/28.)
301 015 Falk, Stadelmann and Co., Ltd. Filaments for electric incandescent optical-projection lamps. (23/11/27.)
299 447 Marconi's Wireless Telegraph Co., Ltd. Aerial systems. (28/10/27.)
307 086 J. Neale. Light-sensitive apparatus for producing or amplifying alternating currents. (29/8/27.)
307 087 W. S. Smith, H. J. Garnett and H. C. Channon. Submarine telephone cables. (2/9/27.)
306 855 H. Andrewes and Dubilier Condenser Co. (1925), Ltd. Means for connecting electrical pick-up devices of gramophones and the like with radio receivers. (26/9/27.)

COMING EVENTS.

Friday, April 12th.

Royal Society of Arts.—John Street, Adelphi, London. Lecture by Mr. A. T. Cooper on "Recent Electrical Developments in India." 4.30 *p.m.*

Saturday, April 13th.

Association of Mining Electrical Engineers (Western Sub-Branch).—Swansea. Annual dinner.

Institution of Electrical Engineers (South Midland Students' Section).—Afternoon visit to Messrs. General Electric Co., Witton.

Monday, April 15th.

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Power Supply and Railway Electrical Signalling." (To be opened by Mr. M. G. Tweedie.) 7 *p.m.*

Institution of Electrical Engineers (Mersey and North Wales—Liverpool—Centre).—The University, Liverpool. Annual general meeting. Short papers by members. 7 *p.m.*

Institution of Electrical Engineers (South Midland Centre).—University, Edmund Street, Birmingham. Paper by Sir C. A. Parsons, F.R.S., and Mr. J. Rosen on "Direct Generation of Alternating Current at High Voltages." 7 *p.m.*

Tuesday, April 16th.

Electrical Association for Women.—Hotel Cecil, Strand, London. Conference, 11.15 *a.m.*; Luncheon, 1 *p.m.*; Ball, 9 *p.m.*

Institution of Electrical Engineers (London Students' Section).—Visit to the works of the British Electric Transformer Co., Ltd., Hayes, Middlesex. 2 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Annual general meeting. 7 *p.m.*

Institution of Electrical Engineers (Students' Section of the North-Western Centre).—Engineers' Club, Albert Square, Manchester. Annual general meeting. Paper by Mr. F. Roberts on "Errors in Current and Voltage Measurements at Radio Frequencies." 7.15 *p.m.*

Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, Westminster. Lecture by Mr. C. V. Hill on "Variable Speed A.C. Commutator Motors." 7.15 *p.m.*

Wednesday, April 17th.

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.

Institution of Electrical Engineers (Tees-Side Sub-Centre).—Cleveland Technical Institute, Middlesbrough. Annual general meeting. 7 *p.m.*

Institution of Electrical Engineers (Sheffield Sub-Centre).—Royal Victoria Hotel, Sheffield. Paper by Mr. F. H. Rosencrants on "Practice and Progress in Combustion of Coal as Applied to Steam Generation." 7.30 *p.m.*

Thursday, April 18th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. R. A. Chattock on "The Modern Use of Pulverised Fuel in Power Stations." 6 *p.m.*

Institution of Electrical Engineers (Irish Centre).—Physical Laboratory, Trinity College, Dublin. Paper by Mr. J. D. Ferguson on "Electric Time Signalling. 7.45 *p.m.*

Friday, April 19th.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Fourteenth Guthrie Lecture by Prof. P. W. Bridgman on "The Properties of the Elements Under High Pressures." 5 *p.m.*

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Address by Dr. A. H. Railing. 6.15 *p.m.*

The National Register.

WHILE there can be few within the electrical industry who are not aware of the existence of the National Register of Electrical Installation Contractors, the importance of the work which is being done by this voluntary body is not sufficiently widely appreciated. Its aims, it is true, have the official sanction of the I.E.E. and representative electrical trade associations, which are represented on the Registration Board, but those who do not come into actual contact with the evils which it is trying to remedy, lack the knowledge which would help them properly to assess the value of its work, and imbue them with a keen desire to give practical aid to the realisation of its ideals. Shoddy wiring is not only the concern of the reputable electrical installation contractor and of the supply authority, though they can best appreciate its menace. Sound electrical installation work in house and factory is of fundamental importance to the whole electrical industry. Upon such a foundation the industry can safely build progressive sales of energy-consuming devices; without it there can be no real advance. A body which can definitely improve the standard of electrical installation work is therefore to be encouraged. That the National Register has, in the five short years of its existence, definitely raised this standard is not to be denied. Vigorous denunciations of the "kerbstoner," and super-optimistic demands for compulsory registration of contractors, are all very well in their way. Much more practical and constructive is the scheme which has brought together, in the interests of good installation work, nearly 1 300 electrical installation contractors in all parts of the kingdom, all of them pledged to put in sound electrical installations. This fact alone would, we think, justify the existence of the National Register, for it has demonstrated that shoddy work is not, as some maintain, an essential to the making of a livelihood in the electrical contracting trade. It has also tended to raise the standard of work among many of the applicants for registration, and indirectly amongst those who have not yet applied. It has also given to contractors on the Register permission to use a badge which is intended to stand as a sort of hall-mark of good installation work.

Educative Publicity.

A HALL-MARK the existence and significance of which are unknown to the public is obviously of little use. How to make it useful has been a problem which has not been easy of solution. It would have been simplified if the registered contractors themselves had done more individually to draw the attention of their customers to this hall-mark; it would have cost nothing, and its cumulative effect would have been great. Many of the contractors, however, seemed to regard this work as a duty of the Register, overlooking the fact that its primary purpose is to act as a qualifying body and not as an agency for co-operative advertising. Progress was naturally impeded by such misunderstandings; but even if the wider sphere of activity had been fully acceptable to the Registration authority, little could have been done in the way of national publicity until such time as there was a fairly representative number of contractors enrolled on the Register.

Some six months ago, however, a stage of development had been reached which justified embarkation upon an educative publicity campaign. With but small financial resources at its disposal, and an enormous public to reach, the authority set itself a tremendous task, but, judging by what we have seen of the Press advertising, folders and other related campaign activities, its efforts have been very fruitful. The campaign has brought the existence of the Register to the knowledge of many thousands of people in all walks of life who had never heard of it before, and it has encouraged these people to think of better electrical installations. The Register has definitely taken its place among the established institutions of the electrical industry, and daily grows in influence. A contractor no longer needs to ponder whether or not registration will benefit him personally; a supply engineer, architect or builder rarely needs to know more about a contractor than that his name is, or is not, on the National Register. Such progress is really remarkable in a movement of such recent growth, and reflects very great credit on all concerned. Quite a number of reputable contractors are still among the ranks of the unregistered, but it is only a question of time before they realise that a contractor, in common with the rest of us, is judged by the company he keeps.

As every fresh admission to the National Register represents a further step in the direction of eliminating the curse

Digitized by Google

of shoddy wiring, the next year or two should see a distinct improvement in this field.

Wiring Practice.

SUGGESTIONS that the National Register should draw up and enforce a wiring code have been resisted in the past, for the very good reason that, to compel the registered contractor to conform to standards considerably above present-day practice, would only serve to penalise him from a competitive point of view. In deciding what is good electrical workmanship, the authority has taken the basic principles laid down in the latest I.E.E. Wiring Regulations as a guide, but, as practice differs in various parts of the country, it has not felt justified in adopting them. While it is difficult to lay down hard and fast rules as to how installation work should be done, it is comparatively easy to say how it should not be done. Acting on this principle, the Registration Board, at Monday's meeting, sanctioned the issue to registered contractors of a list of faults in installation layout or workmanship which, if perpetrated by registered contractors, will be considered to furnish cause for removal from the Register. The application of these " don'ts " should lead to further improvement in the standard of wiring practice, and the list should prove an invaluable aid to the various Local Advisory Committees in adjudicating on the work of contractors in their own localities. Apart from its technical requirements, the document provides that contractors may be removed from the Register for the employment of inadequately paid labour, and the use of boys in unreasonable proportion to that of fully qualified wiremen. This is a point upon which many registered contractors have expressed very definite views in the past, and there is little doubt that this provision will accord with the desires of the whole body of reputable contractors. From the wireman's point of view it should also appeal to, and command increased support from, the E.T.U.

The Budget.

IT is impossible for the business man to look with enthusiasm upon a Budget which contemplates he continuance of Government expenditure at well over £800 000 000 and the maintenance of the standard rate of income tax at 4s. in the £. When he remembers the economic foundations of his own business he is amazed at the spectacle of a Chancellor of the Exchequer having to apologise to the House of Commons for venturing to mention the subject of economy. Still, things being as they are, Mr. CHURCHILL'S fifth and last Budget may be regarded as reasonably businesslike and sound. If the general trading community which is not obsessed by political programmes agrees, in present circumstances, to accept the position that no economies can be effected in Whitehall, and that it is the business of the State to provide a vast number of expensive benefits for all and sundry, then Mr. CHURCHILL may fairly be congratulated on his proposals for tax collection and remission. Even more important perhaps than his actual proposals was the doctrine which he inculcated on the essential soundness of the commercial and financial position of the country. It is absolutely certain, however, that British trade will never be restored to abounding health until there emerges a Minister with the courage to insist on national economy as the basis of sound finance. There are but few points in the Budget which have special application to the electrical industry. The further facilities for the development of rural telephones only touch the fringe of the enormous field open for intensive exploitation of the telephone service. The remission of the railway passenger duty, the capital value of which is given as £6 500 000, is conditional upon the use of the equivalent sum in the development and modernisation of railway transport. Certain activities are outlined, but the most important from the public point of view, the conversion of the remaining gas lighted stock, does not seem to be provided for. The electric vehicle receives no encouragement in the proposed new motor vehicle duties, for while the rates for electrics are unchanged a reduced rate of duty is given to non-electric vehicles. A curious point is involved in the proposal " to provide that for the purposes of the duties charged on mechanically propelled vehicles, a vehicle shall not be deemed to be an electrically-propelled vehicle unless the electrical motive power is derived either from a source external to the vehicle or from an electric storage battery which is not connected with any source of power when the vehicle is in motion." This can only be interpreted as excluding a petrol-electric vehicle from classification as an electric vehicle. Yet as recently as February 14th of this year the House of Lords allowed an appeal by Tilling Stevens Motors, Ltd., from a majority judgment of the Court of Appeal, and ruled that a vehicle propelled by electricity generated by an internal combustion engine on the vehicle is an electrically propelled vehicle within Clause 5 of the First Schedule of the Finance Act, 1926, and is, therefore, subject to a lower duty than a vehicle mechanically propelled otherwise than by electricity. It rather looks as if Mr. CHURCHILL'S scheme will have to be revised in this respect.

Our Overseas Trade.

THOUGH during March our exports and imports were lower in value than for the same month last year, exports improved by £2 958 382 on the February total, and imports by £7 243 986. The decline in last year's figures may be due in part to the fact that there were two fewer working days last month than in March of 1928, and to the fact that the Easter holidays invariably cause a slowing up of business far in excess of what should be occasioned by such a public holiday. Good Friday last year occurred during the first week in April, with the result that March trade was free from the holiday spirit which prevails at that time. This year the slowing up effect of the same holiday was felt not only in March, but it will also have some effect on this month's figures, and though our exports for the March quarter of this year show a decline of £769 065, when compared with the same quarter of last year, there is, nevertheless, an improvement on the same quarter of 1927, by £10 000 000. This general falling off of trade is also noticed in the electrical figures, details of which are abstracted elsewhere in this issue. Exports of electrical goods during March, 1929, were valued at £372 233 less than during the same month last year, while, for the first quarter, a similar comparison shows a decline of £324 460. Electrical imports during the same month and period increased by £56 527 and £110 160 respectively. Export items which contributed to the decline in values were chiefly railway, tramway, and other motors and generators, which, between them, accounted for £100 352, and submarine cables, with a decrease of £50 995. On the face of things, these figures are disappointing, but, when it is remembered that considerable sales in electrical machinery and cables were made to the Central Electricity Board during the month under review, the outlook is less unsatisfactory. The contracts to which we refer have nothing to do with overseas trade, but it is, notwithstanding this fact, interesting to realise that the Central Board last month placed in this country contracts valued at no less than £4 750 000.

Assisting Radio Sales.

A DISTINCT fillip to the sales of portable wireless receiving sets will probably result from the Postmaster-General's decision that in future a wireless reception licence shall cover, in addition to a home set, the use of one portable set at any place in Great Britain or Northern Ireland. While in many cases this concession seems already to have been assumed, the bestowal of legal sanction may suggest to many listeners the advantages of having portable as well as fixed receiving equipment. It may, however, be unwise to depend too strongly on the hope that a large percentage of licensees will in future maintain both fixed and portable equipment, for many listeners are finding that portability is a quality as useful in the home as it is outside, and therefore buy one portable set for all purposes.

HIGH-VOLTAGE BUSHINGS.

Fundamentals in Electro-Statics—Faraday Tubes—Dielectric Refraction and the Design of Rainsheds—Geometric Capacity of Two Coaxial Cylinders.

By W. H. THOMPSON, A.M.I.E.E.

TO bring a conductor at high potential through an earthed plate is a problem in electro-statics, and one which to the present day has proved very difficult of satisfactory solution. Before proceeding further, it may be helpful to recapitulate a few of the fundamentals of electro-statics.

In virtue of its capacity, it is not possible for a conductor to be at a high potential—or any potential, for that matter—without carrying a charge. A charge immediately infers lines of force, and lines of force—or, better still, tubes of force—are the conception of Faraday to explain the action of force across space. They are consequently known as Faraday tubes, and have the property that their density over a given area is proportional to the intensity across that area. In other words, the intensity varies inversely as the cross section of the tube. Again, every Faraday tube takes its origin from a unit positive charge and ends on a unit negative one. Furthermore, the total charge on a conductor is represented numerically by the excess of the number of Faraday tubes that leave the conductor over the number that arrive on it; or vice versa. This is called the polarisation, and constitutes the mathematical equivalent of Maxwell's dielectric displacement.

The tubes exist in a state of tension, and lateral repulsion. The magnitude of the former is a variable quantity, which follows from the definition given above, since this tension varies directly as the density.

Such a system of tubes of force will represent energy, which proves that the energy that results from a charged conductor

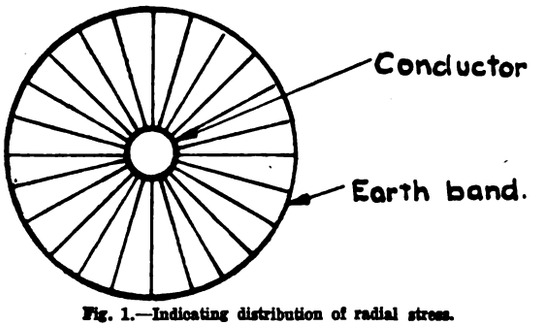

Fig. 1.—Indicating distribution of radial stress.

resides, not on the conductor, but in the surrounding dielectric medium.

The energy of a unit length of Faraday tube is equal, numerically, to the tension that exists along that unit length; or, again, to half the intensity of that unit length. Thus, it is well known that, if e equals the charge, and $V_1 - V_2$, the potential difference, the energy will be equal to

$$\tfrac{1}{2}\, e\, (V_1 - V_2)$$

From which, if e is unity—as it is for a Faraday tube, then the energy equals $\frac{1}{2}\,(V_1 - V_2)$; that is, to half the intensity.

Displacement Current.

An increase in the potential of the conductor must be accompanied by an increase in the charge on it, since $Q = CV$. Also, it is proved by Maxwell* that the charge resides on the surface of the conductor; therefore, an increase in the charge will result in a movement of the electricity outwards from the conductor. This is called a displacement current, and is equal to the intensity times $\frac{1}{4\pi}$ for air; or to the intensity times $\frac{K}{4\pi}$ for a dielectric with constant K.

According to the "Electron theory," a displacement current is the straining of the negative electrons from their central positive nuclei.

If the influential potential is positive, the electrons will be drawn towards the positive charge on the conductor surface, while the nuclei will be repelled from it. The extent of the resulting strain will depend upon the magnitude of the charge. There is a value of the potential at which this strain will become a maximum, and an increase on this will force the electrons and nuclei asunder, with the resulting development of heat, light, and the passage of a spark. Thus the dielectric medium is broken down.

* "Electricity and Magnetism," Clerk Maxwell.

It is to be remembered that in practically all dielectrics there will be a small conduction current due to the presence of a number of free electrons.

The tubes of force must leave the conductor normal to the surface, since the surface is necessarily an equipotential one. They will, therefore, endeavour to distribute themselves in accordance with the shape of the conductor. Thus, for parallel plates they will be parallel, while for a sphere they will radiate from a centre, and so on.

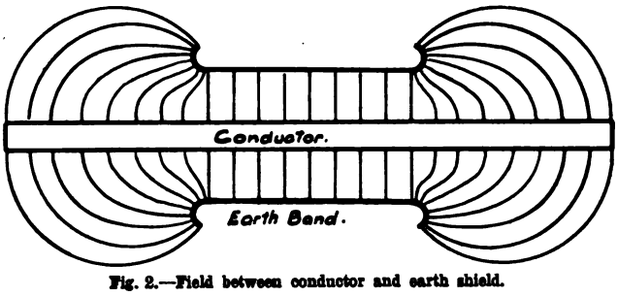

Fig. 2.—Field between conductor and earth shield.

As each tube of force represents a tension depending upon the density, the electrical stress which obtains through a medium will be governed by the number of such tubes that cross unit area, or on the flux density.

It is found experimentally that with air at 15° C. and under a pressure of 760 m/m, the maximum electrical stress it can withstand is equal to $10^4/8\pi$ dynes per sq. cm. This corresponds to a static flux density of $10^2/4\pi$ lines (or tubes) per sq. cm., which represents a tension in the tube of force of 50 dynes.

A density or tension above these respective magnitudes will result in the breakdown of the air.

Potential Intensity.

Coulomb's law states that, in air, the potential intensity is equal to 4π times the surface density of the charge, and from this it is easy to deduce that the intensity, or potential gradient, at any point in the air field is equal to 4π times the flux density at the point considered, or to $4\pi/K$ times the density for a dielectric that has a constant K. From this it follows that the potential intensity corresponding to a flux density of $10^2/4\pi$ lines per sq. cm. in air, is equal to 100 electrostatic units of potential. Or, stated in commercial units, the critical potential gradient for air under standard conditions, as stated above, is 30 000 volts per cm.

It will also be understood from above that the displacement current which flows through a dielectric as a result of an increase in the potential, is numerically equal to the number of Faraday tubes per unit area, or, to what is the same thing, the surface density of the charge.

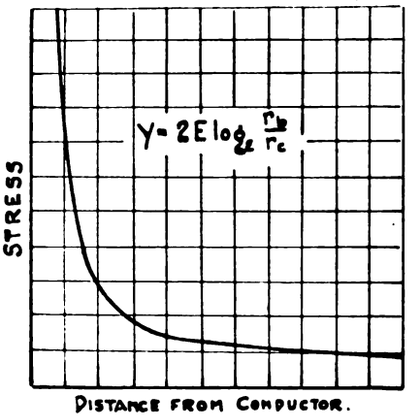

Fig. 3.—Stress near conductor.

It will again be understood from all this, that there is a real movement of electricity through the dielectric surrounding a conductor, whenever there is a variation of the potential of that conductor. Furthermore, a displacement current of this nature has all the characteristics of a conduction current.

It will also be appreciated that a conduction current is accompanied by a lateral movement of the Faraday tubes along the conductor, with the relationship that the magnetic field force is equal to $4\pi NV$; where N equals the electrostatic polarisation, and V equals the velocity of light.

Digitized by Google

Again, it is to be remembered that these lines of force are subject to refraction when they pass from one medium to another, provided they are not incident normally to the plane of separation of the media. The law of this dielectric refraction can easily be proved to be :

$$\frac{K_1}{K_2} = \frac{\text{Tan } \theta_1}{\text{Tan } \theta_2}$$

where K_1 and K_2 are the permittivities of the media, and θ_1 and θ_2 the angles of incidence of the tangents to the lines of force at the surface of separation.

Important Refraction.

This refraction is important in the design of the rain sheds of all kinds of bushings, and it should not be ignored when considering the baffle tubes of the oil-filled bushing or the dielectric layers of the condenser type.

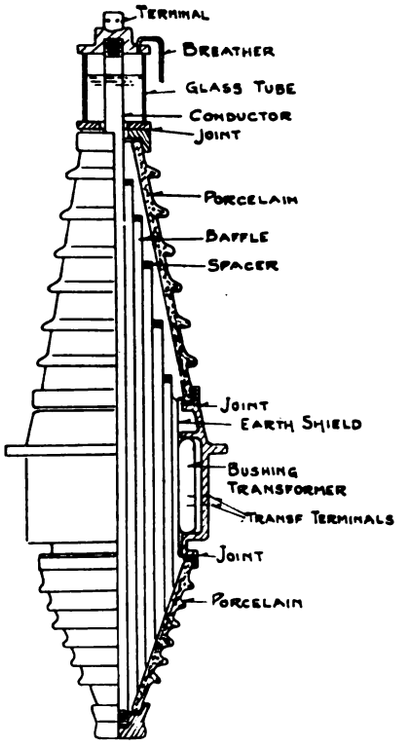

Fig. 4.—Arrangement of oil-filled bushing.

Before proceeding to the more detailed study of the two types of bushings, it may be advisable to consider the question of the geometric capacity of two coaxial cylinders, since all bushings conform to a condenser of that order. In any standard treatise on the subject the proof will be found that this capacity is equal to $\frac{1}{2 \log \varepsilon \frac{a}{b}}$; where "a" is the radius of the inner surface of the outer cylinder, and "b" the radius of the outer surface of the inner cylinder. In practical units the same capacity is given as $\frac{10^9}{2 \log \varepsilon \frac{a}{b} V^2}$ farads.

The additional factors—of which V is the velocity of light—being due to unit constants.

Distribution of the Flux.

If, then, a conductor at high potential be brought through an earthed plate, and the intervening dielectric be only air, the distribution of the flux will be something like that shown in Figs. 1 and 2. From these figures it will be observed that there is a much higher flux density at the ends of the earth band than on the surface of the conductor. Also, within the body of the earth band the flux density is less at the band than at the conductor surface. Altogether, the flux distribution is very unequal.

The earth band, and that portion of the conductor which passes through it, form the equivalent of two coaxial cylinders ; so that the capacity between them is $\frac{1}{2 \log \varepsilon r_b/r_c}$; where r_b is the radius of the earth band, and r_c the radius of the conductor. Consequently, if E is the charge on the conductor per unit length, the potential distribution will be $2E \log \varepsilon r_b/r_c$. This is the equation to the curve in Fig. 3 ; from which it will be seen that the potential gradient is much steeper near the conductor than farther away.

It is this inequality in the potential stress that creates the difficulty in practice, and it should be clear that anything that can be done to control the paths of the flux lines to make them tend to conform to the parallel arrangement will be a definite gain to equalising the stress in the dielectric field.

At the present time there are several types of high voltage bushing terminals. The two most important are the Oil-Filled and the " Condenser " types. These will now be considered.

Oil-Filled Bushings.

This bushing makes no attempt to control the static flux. It accepts the field formation as it is, and depends for its success upon the insulating quality of its oil dielectric to withstand the unequal strain set up within it. In practice, there is much to be said in favour of this, however weak it may seem from a scientific viewpoint.

Such a bushing consists generally of a central conductor passing through an oil-filled space which is bounded by a porcelain shell. If the bushing is designed for oil immersion at one end and the air at the other, the earth band will be fixed about one-third the way up from the oil end—since the flash-over in oil is roughly three times that in air. In the highest voltage ranges, there will be inserted cylinders of insulating material, concentric with the conductor and graduated in length. See Fig. 4.

It is sometimes claimed that the introduction of these insulated cylinders or baffles renders this type of bushing comparable to the condenser type. This is hardly true. Certainly the baffle tubes will have an effect on the distribution of the flux.

For instance, if the material of the baffle has a higher capacity constant than that for the oil, there will be a deflection of the lines, as a result of their crowding into the higher permittivity field. This will cause an increase of the flux density in the oil adjacent to the baffle tube, and precaution must be taken to deal with the risk of corona formation or breakdown will occur.

Purpose of Baffle Tube.

The main purpose of the baffle tube is much the same as that of the tank lining in an oil circuit breaker. It prevents particles of foreign matter, which accumulate in the oil, forming themselves, under the influence of the field force, into a continuous chain between the conductor and the earth band, thus providing a low resistance path to earth.

It is, of course, possible to obtain insulation tubes which will have a capacity constant the same as that for a given oil, and the employment of such tubes will achieve the above results with the additional advantage of leaving the static field undisturbed.

This is an advantage, since local flux concentration, from whatever cause, and in either oil-filled or condenser bushings, can be the cause of considerable trouble.

It is shown by Peek,* that for dielectrics in series, such as is formed by the introduction of insulating cylinders in an oil-filled bushing, the resulting potential gradients across the various dielectrics is given by the formula :

$$G_x = \frac{e}{K_x\left(\frac{x_1}{K_1} + \frac{x_2}{K_2} + \ldots + \frac{x_x}{K_x} + \ldots + \frac{x_n}{K_n}\right)}$$

G_x being the gradient at any point x ; e the applied voltage, and K the permittivity. This, however, assumes parallel flux distribution, which does not occur in the oil-filled bushing, except for the length of the earth ring between this ring and the conductor. The remaining portion of the field is formed of curved lines which suffer refraction for those that strike the insulating tubes, and distortion for those that pass near to the edges of the tubes.

(To be continued).

BOOK REVIEWS.

Electric Wiring: A Handbook for the Use of Wiremen and Students. By W. C. CLINTON and E. H. FREEMAN. (London: John Murray). Pp. 260. 4s. 6d. net.

The fact that this primer has gone through three editions since the War, and that it is now in its eighth edition, testifies to the regard in which the work is held. The present edition represents a thorough revision and considerable enlargement of the seventh edition. In view of the increasing use of alternating current, the addition of chapters dealing in an elementary way with these developments is a desirable new feature, as is the new matter descriptive of the planning of complete installations. One notes also the extension of the worked examples, most of which are taken from papers set in the City and Guilds examinations. Those who share the authors' view that the usual continuity test of a conduit system, i.e., the ringing of a bell through the tubing with an ordinary dry cell, is not sufficiently reliable or definite, will find interest in the method used by the authors, who insist that a current of 5A shall be passed with a 4 V accumulator for each 1 000 ft. run of tube. A properly installed tubing system should pass this test without difficulty. In the interests of historical accuracy, it is a pity that on page 132, the authors should have fallen into the misapprehension that the first incandescent lamp filaments were of platinum. Actually, carbon was the first commercial filament, being incorporated in the earliest of lamps produced by the late Sir Joseph Swan.

Automobile and Radio Batteries. By H. H. U. CROSS. A practical manual on the Construction, Charging, Maintenance and Repair of Automobile, Motor Cycle, and Radio Batteries: "Dry," Lead and Alkaline Types. (London: Crosby Lockwood and Son.) Pp. vii+128. 3s. 6d. net.

This little book by Mr. Cross is a welcome change from the style of most practical manuals, since it combines a measure of very clearly stated scientific information with a still larger measure of information based on practical observation, experiment, and proof.

Chapter one deals with dry cells, stressing particularly the factors which affect performance, and giving useful data on the measured output of some well known types. A useful dodge for recuperating flash-lamp cells is mentioned.

The general chemistry and construction of the lead cell are next described, followed by a careful review of available methods of charging. No doubt in future editions Mr. Cross will describe some of the modern rectifiers which have come into such wide use for this duty. True, the rectifier is mentioned, but recent advances of valve type units and the Westinghouse copper-oxide film apparatus are of great interest in this connection. There is a printer's error in describing the Nodon valve as Nocton.

Repair and upkeep are given due attention in Chapter IV, which is very clear and practical. There follows a *résumé* of the alkaline cell, both Edison and Nife (Jungner) types being clearly explained. A useful summary of the chemistry of the alkaline cell cycle on charge and discharge is also given. Mention is made of the utility of scrap Edison cell plates to supply the components for alkaline h.t. cells. This is a little known but most valuable type of h.t. unit, immune from most of the defects of the normal h.t. cell.

The remainder of the volume deals with accumulators from the service station standpoint. The illustrations are in the main very clear, and this little volume may be thoroughly recommended as an excellent example of compressed technology without too much "ology."

R. J. M.

Ultra-Violet Radiation and Actinotherapy. By E. H. RUSSELL and W. K. RUSSELL. (Edinburgh: E. and S. Livingstone.) Pp. 648. 21s. net.

The idea of obtaining artificially the beneficial effects of natural sunlight in a clime in which there seems to have been a considerable deficiency of late, has so taken hold of the public mind that the interest in and demand for ultra-violet ray apparatus has developed before its time, as scientific workers specialising in this field are only beginning to find out the real effects of irradiation on human bodies under various conditions. In this book Dr. Eleanor Russell and her husband, Dr. W. Keir Russell, whose work at the Sun-Ray Clinic at Newcastle-on-Tyne is well known, give a great deal of valuable information regarding the diseases in which irradiation has proved beneficial and the methods of application. From the non-medical standpoint, however, the chief practical interest of the work lies in the authors' personal experience with a large number of different models of ultra-violet lamps. Feeling it unwise to limit their interest in one type of lamp, they have described every well-known type of arc lamp and mercury vapour lamp, most of the appliances being illustrated. They have found many different types of lamp generally satisfactory, and the air-cooled mercury vapour lamp particularly so. The difficulty, they state, is not any inability to get sufficient ultra-violet radiation, but trouble in gauging the precise amount required by the patient; a fine tribute, this, to the perfection of the apparatus used.

Although, as members of the medical profession the authors might be thought to hold a biassed view, they are supremely right in stressing the importance that this valuable remedial agent shall not be carelessly allowed to pass wholly into unqualified hands. Even with the types of domestic equipment in which a time switch gives only measured doses of irradiation, there is, of course, nothing to prevent the user from taking another dose. In any case a harmless dose for one person may have unfortunate effects upon another.

There is no doubt that ultra-violet ray treatment, at present in its infancy, will increasingly take the place of medical treatment of many diseases, besides establishing a new and ideal form of procedure—preventive, rather than curative treatment. At no very distant date "sun-ray" lamps will have to be installed in all hospitals, especially those for diseases of the skin, throat, nose and ear, and eye. Ante-natal clinics, tuberculosis clinics and sanatoria, and mental hospitals will also require ultra-violet equipment. In surgical practice the value of ultra-violet radiation, as yet only rarely acknowledged, is bound to come into prominence when the results of the pioneer work at the Neckey Hospital in Paris are more widely known. Well printed on good paper, the book is very completely illustrated.

C. G. B.

Electric Lighting and Heating. By F. H. TAYLOR. (London: Chapman and Hall). Pp. ix+149. 7s. 6d. net.

Mr. Taylor's new book on electrical installation work claims to deal with practical applications, and definitely disclaims any attempt to explain the theory of electric currents, and whilst this treatment certainly simplifies the study of the subject it is doubtful whether some elementary explanations of electrical phenomena would not have increased the value of the work.

There is not much that is novel in the views put forward by Mr. Taylor, although there will probably be many who will not agree with all his views, as, for example, that the use of metal conduit must be avoided where "certain plasters and patent floorings" are in use. The chemical action on the tube in such cases is very temporary, and it is in practice impossible to avoid using tubes in such cases. A coat of paint in any event will give all the protection necessary.

Mr. Taylor's comments on the necessity for effective earthing, and on the desirability of some more reliable test than the ordinary bell and battery are very sound, but it would have been to the good had he further insisted on a similar test for the effective continuity and conductivity of the actual tubing.

The book covers the subject very completely, and deals with practically all aspects of the actual installation work, but some remarks on the apparatus to be connected to the installation when complete would have added to the value of the book.

The illustrations which form so prominent a feature of the book (perhaps too prominent, in that they occupy an undue proportion of the space) deserve a special word of praise, as they are excellently prepared and printed.

AN INVESTIGATION OF SHORT WAVES.*

Scattering, Multiple Signals and Signal Mutilation—Results of D.F. Interception of Short Wave Commercial Stations—The Nature of "Skip Effects."

By T. L. ECKERSLEY, B.A., B.Sc.

THE paper contains a summary of investigations of short-wave transmission extending over the past two years. The greater part of the paper is devoted to a discussion of scattering, multiple signals and signal mutilation, following which the results of a nine months' direction-finding interception of short-wave commercial stations are given. Finally there is a general discussion of short-wave transmission and of the nature and constitution of the Heaviside layer, fading, polarisation effects, etc.

Echo and Scattering Effects.

Interest in short-wave transmission, from a technical standpoint, lies chiefly in echo and scattering effects. Signal distortion, accompanying echoes and scattering, imposes a severe limitation on high-speed sending. The time-lag of echoes and multiple signals may range from 0·001 to 25 secs., but it is mainly the short echoes up to 0·1 sec. which are associated with scattering. The author has previously given reasons for believing that considerable short-wave scattering exists, and this suggestion has since been verified. A balahcing test, utilising two vertical aerials set up in turn at 13 m. and 30 m. apart is described. The receiver was set up at Broomfield, near Chelmsford. Signals from local stations could be balanced almost perfectly, but those from stations within the "skip distance" (e.g., Bodmin, Grimsby and some Dutch stations) could not be balanced with any arrangement of the circuits. Long distance stations such as those in Canada, Australia, India, S. Africa and N. America, presented intermediate conditions.

Results indicate that close to the transmitting station the direct ray is predominant, but it is attenuated quickly, and at distances of a few miles is swamped by radiation scattered from the Heaviside layer, or from irregular objects on the ground or other causes. The scattered signal or "echo signal" travels by a different path from the direct signal, and there will be a time interval between the two.

Success with the two aerial system led to the development of a direction-finding apparatus, and the author describes this arrangment, which is known as the Adcock aerial. Results obtained with this apparatus are described in detail, and various experiments on scattering effects are discussed. One interesting conclusion is that scattering seems to be mainly confined to the horizontal plane. The phenomena of multiple signals, long and short echoes and dispersion are also discussed. Other problems treated are the degree to which scattering involves attenuation, the influence of wavelength on scattering, and polarisation effects. These experiments led to the conclusion that signal mutilation may arise from the following causes :—

(1) *Long echo*, due to the signals arriving by the two different great-circle paths round the world, or by one traversing an extra complete circumference of the world. These effects are easily recognisable, but, taking due account of them, there are, no doubt, other causes of signal mutilation.

(2) *Dispersion*.—Any signal changes shape when travelling through a dispersion medium, such as the Heaviside layer. The amount of mutilation depends on the distance travelled and the closeness of approach of the actual frequency to the critical frequency. Reasons are given for supposing that this effect is negligible on the short-wave band, although there is evidence of dispersion effects on very long waves, *e.g.*, musical X's.

(3) *Quick Echo*.—There are cases of quick echo with a lag of the order of 0·01 sec., which are probably due to long-distance scattering such as is evidenced by the observations on the local beams, where the source of scattering may be about 2 000 km. away.

(4) *Blurring*, due to multiple scattering.—This probably occurs mostly on local signals.

(5) *Double signals or multiple signals*, due to double or multiple paths.—These produce double or multiple signals with a time interval between signals of the order of 0·01 sec. They are brought to light by the picture-transmission result. They are not likely to mutilate Morse signals, but effect picture transmission unfavourably.

The effects under these last three headings are likely to contribute to signal mutilation in different proportions, according to the actual conditions of transmission.

The next section of the paper is devoted to direction-finding results, which are analysed in considerable detail. Diagrams are presented for various stations showing the relation between time and bearing degrees, and a comprehensive table of bearings of distant stations is presented.

The phenomena of fading are discussed, and the effects of polarisation, interference, and spacing of aerials are considered. There appears to be a marked connection between attenuation and magnetic storms, and the author presents the results of a year's interceptions which illustrate this. Of the 27 occasions when the magnetic disturbance was greater than 1 508, fifteen were associated with "fades" in the transmission, but there were occasions when a magnetic storm was unaccompanied by a fade, or vice versa. One very marked case was on October 10th, 1928, when, at the Somerton station in England, all stations faded out within about 2 minutes. Similar effects were reported in Germany.

In the final portion of the paper the theory of the subject and the nature of "skip effects" are discussed on the basis of the new conception of the Heaviside layer as a complex structure of scattering clouds. The chief alteration in conclusions previously reached is in the estimated height of the lowest levels of the Heaviside layer in the daytime. The accumulation of evidence from the time-lag experiments of Breit and Tuve, and the interference experiments of Appleton and those of Hollingworth have led the author to a revision of the mathematical result by which he obtained, from long-wave measurement, the effective height of the daylight ionised layer. In doing so he has found an error which makes the estimated height just double that previously obtained, for instead of the relation $d_0=4h^2/\lambda$, we have $d_0=h^2/\lambda$, making the estimated height lie between 80 km. for summer and 97 to 100 km. for winter.

Previously the value of τ, the mean time between collisions, was found to lie between the limits $0{\cdot}5\times10^{-6}$ and $0{\cdot}5\times10^{-7}$ (on the basis of magnetic storm effects). Calculations based on the kinetic theory would imply a height of between 76 and 92 km. for these values of τ in fairly close agreement with the above, and there is no necessity to make the rather forced assumption previously made that the electronic mean free path was some 10 to 50 times greater than that calculated from the normal kinetic theory on the assumption that the electron may penetrate the outer rings of the molecules without being appreciably deflected. Apparently this effect occurs only in inert gases, such as helium, and is not likely to occur in the upper atmosphere.

A Progressive Change.

With regard to scattering, the glancing angle for transmission great-circle bearings of the main rays, and the daylight attenuation, the author has found the previous conclusions to be on the whole well-founded. Some modification of the lower wavelength limit for night transmission is required, and the author finds that this lower limit depends on the time of the night, and season. Late-night regions behave very differently from early-night regions, thus confirming Appleton's results showing a progressive change in the Heaviside layer during the hours of darkness. The short-wave daylight limit appears to be close to 10 m., but sporadic long-distance transmissions have been observed on wavelengths shorter than this.

* Abstract of a paper read before the Institution of Electrical Engineers on April 10th.

ELECTRICAL INSULATING PAPERS.

In view of the necessity for rigid condensation, the report of the I.E.E. paper by Messrs. T. N. Riley and T. R. Scott on "Electrical Insulating Papers for the Manufacture of Power Cables" (see THE ELECTRICIAN, April 12th, 1929, page 441) may in one or two places lead to misapprehension as to the authors' views, and readers interested in the subject should refer to the valuable technical data embodied in the original paper. Owing to a printer's error, the word "beating" (p. 442, col. 1, line 73) was given as "heating," and a paraphrase of a reference to a paper giving all-round satisfactory characteristics (p. 442, col. 2, line 21) might be regarded as a contradiction of the authors' main purpose, which was to emphasise the importance of structure rather than fibre base.

THE NATIONAL REGISTER.

Encouraging Progress Reported at Annual Meeting of Registration Board—Useful Results from Propaganda Campaign—E.C.A. and Local Advisory Committee Representatives.

THE annual meeting of the National Register of Electrical Installation Contractors was held at the Institution of Electrical Engineers, London, on Monday, Mr. P. V. Hunter in the chair.

The fifth annual report of the Executive Committee for the year ending December 31st, 1928, which was presented to the meeting, states that the figures in the accounts relating to expenditure show a considerable increase on those of last year, but this mainly centres round the items advertising and publicity literature, printing and stationery, and rent.

Special Publicity Campaign.

Taking the Income and Expenditure Account first, the first figure on the Dr. side, " advertising and publicity literature," includes the expenditure of part of the allocated sum of £400 on advertisements in the electrical, architectural, building and municipal Press, the printing and circulation of the lists of registered contractors, reprints of the article by Mr. Harry Moss entitled " The Need for Compulsory Registration," the first issue of the pamphlet " Hidden Risks," the brown cards, and certain local lists of registered contractors. The item " printing and stationery, dies and stamps " shows an increase of nearly £140 accounted for by the printing of the amended rules, shorthand notes transcript and copies of the proceedings at the special meeting of the Registration Board with members of the Local Advisory Committees, and the shorthand notes transcript and copies of the proceedings at the conference between the Executive Committee and the Electrical Contractors' Association Council (referred to later), the provision of better folders for files for the records of applications for registration, and the provision of a larger and better stock of stationery necessitated by the increase in the office work of the Register. The item, rent, includes the payment of a quarter's rent in respect of the new office which is referred to later. The item, office and petty expenses, includes the purchase of further filing cabinets, the installation of fittings for lighting and heating the new office, and the purchase of furniture and effects for its equipment.

There are two further items, legal expenses and engineers' fees for inspection of work done by registered contractors, which have not before appeared in the accounts. The former was incurred in relation to proceedings for an injunction against a firm of contractors who had improperly used the device of the Register granted to their predecessor before their application for registration had been adjudicated upon by the Executive Committee, and who, unfortunately for the Register went into liquidation with assets insufficient to pay a dividend to creditors. The latter item was a payment in respect of the fees and expenses of a firm of consultants who were instructed to report upon work by a registered contractor, the subject of a complaint which is referred to later.

On the other side of the account the figures show increases which speak for themselves, and with the foregoing explanation the figures on the balance sheet will be better appreciated. The item, sundry creditors, in the balance sheet includes amounts due for payment but not paid at that date, all of which were paid in the subsequent month.

On the other side the first item stands as before. Investments include an additional £500 War Loan purchased, but on the other hand the former item, cash on deposit, disappears. The item, " expenditure on advertising campaign carried forward," is the proportion of the £400 allocated which has been paid, and covers advertisements up to October, 1929. With regard to the rent item, the restricted accommodation of the old office had become wholly inadequate for carrying on the increasing work of the National Register, and the secretary was fortunately under exceptional circumstances able to secure a much larger room on the ground floor in the same building. The rent was higher, and the term commenced three months prior to the expiration of the tenancy of the old office, but the Executive had no hesitation in taking advantage of the opportunity, and securing the better accommodation, installing electric fires and up-to-date lighting arrangements. The work of the office is now carried on under much improved conditions.

The report gives figures showing applications for registration, acceptances, withdrawals, etc., at various dates. These show that 257 applications were received in 1928, and the total applications to December 31st were 1 584, a figure which was further increased to 1 658 by April 5th, 1929.

Taking the December total of 1 584, a deduction of 434—leaving a net number on the Register of 1 150—is made for the following reasons: Applications declined, 180; applications withdrawn, 31. Registrations were cancelled as follows: At applicant's own request, 4; bad workmanship, 2; failure to substitute duly qualified managers, 8; death and closing down of business, 36; failure to renew registration, 43; bankruptcy, liquidation, deeds of arrangement and assignment, 35; temporary registration, 1. There are also included applications under investigation to the number of 94. By April 5th the numbers under investigation had been reduced to 75, and the net number on the Register was 1 202, exclusive of 55 branch registrations.

ASSISTED WIRING SCHEMES.—To those authorities who had already confined installation work on assisted wiring schemes to contractors on the National Register, the following names were added during the year: Birmingham, Leeds, Oldham and Plymouth. On the other hand, the South Shields Corporation, for reasons which, the report states, are difficult to appreciate, and which in any case do not reflect adversely on the conduct of the Register, rescinded a prior standing order which placed them in the same category.

PUBLICITY.—As before mentioned the Executive Committee allocated the sum of £400 to the purposes of propaganda. Under able advice the money so allocated has been, in the view of the Executive Committee, well expended and made to go a long way. A reprint of an article in THE ELECTRICIAN by Mr. Harry Moss (a registered contractor), entitled " The Need for Compulsory Registration," has been circulated to consultants, supply engineers, architects, builders, contractors and others, to the number of approximately 15 000. A pamphlet entitled " Hidden Risks " was also similarly issued, and became popular to the extent that contractors alone have applied for copies for distribution to the number of 100 000, and requests for supplies are being continuously received.

Full-page, half-page and quarter-page advertisements have been inserted at stated intervals in the whole of the electrical Press, in the "Architect and Building News," the "Architects' Journal," the " Builder," the " Municipal Journal," and many encouraging editorials and notices in those papers as well as in the daily Press have brought the National Register and its aims and objects to the notice of a wide public. A large number of inquiries of a varied nature showing interest in the Register have been received from all parts of the United Kingdom and abroad, including India, Australia, and the United States of America, showing that the work of the National Register has penetrated far and near. The carrying out of this publicity campaign has made very considerable demands on the energies of the very limited staff of the Register, and the Executive Committee take this opportunity of acknowledging the services given, the extent of which it is not easy to appreciate.

Joint Meeting with E.C.A.

It is recalled that at the last annual meeting the subject of the Standing Order of March 14th, 1924, relating to the constitution of Local Advisory Committees was discussed, and a proposal put forward, to amend such Standing Order, so as to ensure that the representatives of the Electrical Contractors' Association on such Committees should be on the Register. The outcome of discussion on this proposal was a resolution " that the Executive Committee be given full power and authority in the name of the Registration Board to vary the Standing Order either in terms of the draft submitted, or in such other manner as they should think fit after they had obtained the views of the Electrical Contractors' Association on the subject, and that to this extent the present Standing Order of the Registration Board be suspended." The Electrical Contractors' Association representatives present promised that the subject should be discussed at the next Council Meeting of the E.C.A. and a joint meeting of the Executives arranged for the purpose of coming to agreement on the matter.

Owing to various causes this joint meeting of the Executive Committee and the Council of the Electrical Contractors' Association was not held until December 7th last. At this meeting the subject of Local Advisory Committee representatives and other matters were freely discussed and misunderstanding removed. The Executive ventures to say that such

Digitized by Google

discussion disclosed the fact that its attitude had not been properly appreciated, and it is now clear that in the main the ideals of both bodies are common, although there must be differences in procedure.

With regard to Electrical Contractors' Association representatives on Local Advisory Committees, the following resolution was unanimously passed: "In nominating representatives on Local Advisory Committees the Electrical Contractors' Association will, where they are unable to nominate a registered Contractor, nominate a representative who will apply for admission to the Register, and who is not admitted to the Register within twelve months will be ineligible as such representative, and the Electrical Contractors' Association will forthwith proceed to make another nomination in conformity with this resolution." Discussion also took place as to the construction of certain of the Rules and Conditions of registration, at the conclusion of which it was agreed that the Electrical Contractors' Association would submit their suggestions in writing. Some time prior to this meeting the Executive Committee unanimously passed and forwarded a resolution inviting the President of the Electrical Contractors' Association for the time being to attend their meetings, so that they might know at first hand the difficulties that the Executive had to contend with, and better appreciate the conduct of the National Register's affairs.

The Executive Committee is happy to draw attention to the fact that it is receiving considerable help and encouragement from the Press, and the destructive criticism to which attention was drawn in the last report has given place to a constructive attitude, which is much appreciated, and greatly assists the Register's efforts to carry out the objects for which it was formed.

Wiring Rules.

The adoption of Wiring Regulations has been a constant subject of consideration and discussion, but the Executive Committee is still of opinion that the time has not yet arrived for making compulsory a set of such regulations. Recent events have, however, proved the necessity of some provision being made for bringing under the ban of the National Register certain unsatisfactory features in installation work, and Mr. Cash, at the request of the Committee, prepared a list of examples of faulty wiring work which it is recommended shall be the basis of a Regulation or Standing Order, and the employment by a contractor of such methods will be deemed to come within the causes detailed in Rule 10 (b) (c) and (d) and be cogent reasons for the exercise by the Executive Committee of the disciplinary powers conferred on them by such Rule. A draft of the proposed regulation has been circulated, and the Executive Committee invites the Registration Board's approval and adoption. It is felt that this regulation will be a real help to Local Advisory Committees in making reports and recommendations, and, as a copy will be sent to every contractor on the Register, it must act as a deterrent to any who carry out work on the lines condemned.

In this connection, the Executive Committee desires to state that recently a report from a certain Local Advisory Committee on an application for registration disclosed such a difference of opinion on the part of the members of that Committee as to their views and recommendation that it was necessary for a member of the Executive Committee to interview both the Committee and the applicants. Mr. Cash was good enough to undertake this duty, and made two special journeys to the town in question and interviewed the Local Advisory Committee and also inspected several wiring jobs carried out by the applicants. In the course of his inspections and investigations it appeared to be a practice in the locality to carry out wiring work in a manner that conflicted with the proposed regulation. As a result of these investigations the applicants were required, as a condition precedent to acceptance of their application for registration, to alter the installations in question, and to undertake to avoid repetition of such methods in the future. A greater result arises out of these investigations, viz., that in the area in question similar methods are henceforth banned, not only to Registered Contractors, but generally; as the attention of the supply authority and those who have the placing of orders has been drawn to such work on the part of any contractor, registered or not. The Executive Committee feels that it can claim this as a considerable step in the direction of achieving one of the objects of the constitution of the National Register, viz., the improvement and standardisation of electrical installation work.

Local Advisory Committees.—The seventeen London area Committees referred to in the last report have practically been filled and are now operating, and the lists of installation contractors within those areas are now in their hands for report on renewal of certificates. With one or two exceptions, the work of all Local Advisory Committees has proceeded smoothly and with reasonable despatch, and the Executive Committee again wishes to tender its great appreciation of the time and trouble expended by the various members of such Local Advisory Committees, as well as of the many helpful suggestions received from them. To those supply engineers on such Committees who have so strenuously supported, and are supporting, the National Register special recognition is due.

Scrutinising Committee.—The services of the two members of this Committee, Messrs. Cash and Purse, have as usual been ungrudgingly given, and without stint. The Executive Committee appreciates those services to the full, and expresses its grateful thanks.

Complaints Against Registered Contractors.

Complaints of bad workmanship against two firms were lodged during the year. In one case a member of the Association of Consulting Engineers was instructed to investigate and report, and his report fully substantiated the complaint made. The contractors concerned appeared before the Executive Committee, and their explanation was considered so inadequate that their certificate of registration was cancelled, and their name deleted from the Register.

In the other case the complaint was admitted, but the explanations tendered satisfied the Executive Committee that there were extenuating circumstances which justified them in taking less severe measures, and as a condition of remaining on the National Register the contractor was required to make good at his own expense the inadequate work which formed the subject of complaint, and also any other similar work carried out by him, and to give a satisfactory undertaking in respect of all future work.

Complaint was made against another Registered Contractor for employing an undue proportion of boy labour and the payment of inadequate wages. This contractor appeared before the Executive Committee and verbally agreed to increase such wages to a satisfactory rate. He subsequently, however, declined to carry out this undertaking, and his application for the renewal of his certificate was declined, his certificate cancelled, and his name removed from the Register.

Certain general complaints were also made against other firms, but as the secretary was unable to obtain any corroborating particulars from the complainants it was not possible to pursue them further.

Nominations to the Registration Board.—The I.M.E.A. nominated Mr. W. A. Walker as their representative in the place of Mr. C. H. Smyth who resigned, the E.C.A. of Scotland have nominated their President, Mr. J. Johnston Foggo, in place of Mr. Ure, their retiring President, and the remaining nominating bodies have nominated their retiring representatives to continue their representation on the Registration Board.

Secretaryship.—The Committee has to report that it has received an intimation from the secretary that, as the National Register now appears to be on a firm basis, he cannot continue to devote the large amount of time and attention he has hitherto given to the duties of that office, and asks for some arrangement to be made, as soon as convenient, to relieve him as far as possible. The Executive has the subject under consideration, and asks for authority to make such arrangements as seem right and proper.

Chairman.—The executive Committee again places on record its thanks to Mr. P. V. Hunter, the chairman, for his able conduct of their proceedings during the year under review.

Scottish Contractors' Views.

In the discussion of points on the agenda, Mr. R. A. Ure said that the registered contractors in Scotland would like to know if something could be done to establish some sort of local committee to make known to the Scottish people that there was such a thing as a Register of Electrical Contractors. Mr. P. V. Hunter replied that the Executive Committee would consider the proposal at its next meeting.

Mr. W. R. Rawlings, hon. treasurer, in seconding the adoption of the report of the Executive Committee—moved by Mr. Hunter—referred to the accounts, and said they were increasing their assets each year and also their expenditure; two points which were both desirable. Their investments were all in good securities, and were bringing in increased dividends each year. The resolution was carried unanimously.

The Secretary (Mr. T. Trimnell) announced that the

Digitized by Google

following members of the Registration Board had been re-nominated: Messrs. G. Archer (Electric Supply Association of Ireland), A. G. Bruty (I.E.E. Irish Centre), H. R. H. Burstall (Association of Consulting Engineers), H. J. Cash (E.C.A.), J. S. Dow (Illuminating Engineering Society), A. E. Iliffe (B.E.A.M.A.), W. R. Rawlings (I.E.E.), and W. A. Walker (I.M.E.A.). New nominations were: Messrs. J. Johnston Foggo (E.C.A., Scotland), and D. Foster (E.W.F.). The whole of these nominations were accepted and confirmed.

Mr. F. W. PURSE proposed, and Mr. W. A. SHAW seconded, the re-election of Mr. P. V. Hunter as chairman, and the proposal was carried with acclamation.

Mr. W. R. RAWLINGS next moved, and Mr. R. A. URE seconded, the re-election of Mr. A. H. Dykes as vice-chairman, and this also was carried unanimously.

Mr. Trimnell then read a draft of a standing order which it was proposed to send out for the information of registered contractors and local advisory committees, and which read as follows: "*Re* National Registration Rule No. 10 (Removal of Names from Register) sub-sections (b), (c) and (d).—The Registration Board having through its Executive Committee from time to time been compelled to take disciplinary action in the cases of certain registered contractors, whose workmanship has not been found satisfactory, considers it advisable to inform all those whose names appear on the Register that any of the following faults in layout or workmanship will render the responsible contractor liable, at the discretion of the Executive Committee (subject to the right of appeal to the Board), to have his name struck off the Register. (1) Serious and inexcusable over rating of mains, submains, or subcircuits and all controlling apparatus connected therewith. (See I.E.E. Wiring Regulations 74 and 95.) (2) Inadequate methods of ensuring the electrical and mechanical continuity of metal-sheathed cables and conduit systems and lack of permanent earthing connections for such metal coverings. (See I.E.E. Regulations 87 and 96 to 103.) (3) Leaving the ends of tubes at switch points, lighting points, or distribution boards without suitable bushing by protective nipples or by a suitable outlet-box, or wood block. (Note.—Cutting a block over conduit in a manner which does not bush the end of the tube is a breach of this requirement.) (4) On concealed tube systems failure to provide a suitable outlet which will protect the wire right up to the surface of wall or ceiling; or, alternatively, failure to bring the tube through to surface of wall or ceiling. (5) In the case of metal-sheathed, tough rubber sheathed and similar cables, failure to bring the whole of the protective covering through to the surface of wall or ceiling. (6) Failure to keep clear of used or disused gas pipes in such a manner that they cannot be brought into accidental contact with the wiring or its conduits. (7) The insertion of more wires in a conduit than will allow of at least one more wire of the same size as the largest already in the conduit, being easily pushed in for a distance of 6 in. (Note.—I.E.E Table XII. is the best guide as to the capacity of the conduits.) (8) The absence of reasonable precautions to safeguard against risks of fire and shock. (9) The employment of inadequately paid labour and the use of boys in unreasonable proportion to that of fully qualified wiremen. NOTE.—As a guide, registered contractors are expected to follow generally the basic principles laid down in the I.E.E. Wiring Regulations (current edition), and all registered contractors are expected to make themselves conversant with those regulations which apply to the work on which they are engaged. Where specific regulations are referred to in paragraphs 1 and 2 above, they will be found to make clear in detail arrangements which should be adopted for the purpose of avoiding the faults enumerated."

Mr. TRIMNELL also read a letter from Mr. J. Johnston Foggo expressing the opinion that the Board's proposed warning did not go far enough. The I.E.E. Regulations Nos. 74 and 95 did not give adequate protection against overloading and heating, and he suggested that each power socket should be wired for a 15A, and should have a 15A fuse. Neither Regulation 25 nor Regulation 124A gave sufficient protection. At present several appliances were supplied from one circuit, on the assumption that not more than one socket was likely to be used at one time, but occupiers would think they could use as many appliances as there were sockets. He also recommended the use of screwed steel conduit and the provision of iron outlets at each point. The I.E.E. Table XII should be insisted upon. If provision were made for fireproof installations, regulations would become better recognised than at present.

Mr. H. J. CASH moved that the notice as drafted be adopted, and said what Mr. Foggo asked for was not practical politics. His proposals were desirable, but they must move cautiously.

Importance of Good Jointing.

Mr. F. W. PURSE said he endorsed the proposal thoroughly. He suggested an addition after No. 7 as follows: "Inefficient and unsatisfactory jointing of cables and flexible cords or connections between cables and flexible cords and failure to protect such connections." I.E.E. Regulation 93 dealt with the methods which should be adopted for jointing cables and connecting them. It required a proper mechanical connector to be used, and where joint boxes were used, they should be of durable non-ignitable material. If a man did not joint his cables properly he certainly should not be on the Register.

After further discussion, Mr. Purse withdrew his motion, and it was resolved that the document be remitted to the Committee with powers to issue it forthwith.

Messrs. Hunter, Dykes and Cash were re-elected members of the Executive Committee.

Mr. T. Trimnell, who is resigning the office of secretary, but has promised to continue to give the Board all the assistance possible, was accorded a hearty vote of thanks for his valuable services to the Register.

ON Tuesday members of the Electrical Association for Women held a one-day Conference in London. After a meeting in the morning, a lunch was held at the Hotel Cecil (Mrs. Wilfrid Ashley in the chair) at which the speakers included Sir John Snell, Lt.-Col. K. Edgcumbe, and Lady Emmott. The afternoon was devoted to a visit to the works of Belling and Co., and the day's proceedings concluded with a ball and cabaret at the Hotel Cecil, at which about 250 members and friends were present. The photograph reproduced above was taken during the luncheon.

ADVERTISING FOR CONTRACTORS.

Practical Hints on Newspaper Advertising—Utilising Manufacturers' Sales Helps—Importance of Shop Sales—Planning the Campaign.

By "PUBLICITY CONSULTANT."

TO say that the great majority of electrical installation contractors do not yet appreciate the value of advertising in their own business, and that the efforts of those who do make occasional attempts at advertising are the reverse of attractive, may be brutal; unfortunately, it is also true. The number of electrical contractors who do conduct a reasonable amount of advertising, in a skilful manner, can almost be counted on the fingers of one hand, but as advertising, in one form or another, is so essential to the proper development of retail electrical sales, I propose to offer some practical hints, based on extensive experience of retailer advertising, which it is hoped will put contractors' advertising on a proper basis. As it is commonly recognised that advertising, if not a science, is an art, and calls for a certain amount of specialised knowledge, many potential retail advertisers are apt to conclude that it is beyond their capabilities, and calls for the employment of an expert.

Where the size of the business justifies the employment of a man trained in advertising methods, it is certainly a good thing to be able to command the services of an advertising expert. But in the average small business, where the employment of one man for advertising purposes only would be sheer extravagance, it is fairly easy, as I hope to prove later, for the proprietor or other responsible member of the staff of a contracting firm to assimilate the basic principles underlying all successful advertising effort, and to conduct his own advertising in a way that is both pleasing and profitable.

Common Sense Principles.

The principles are founded on ordinary common sense, and when the subject is approached in this light, many of the apparent difficulties become extremely simple. For the benefit of those contractor-readers of THE ELECTRICIAN who are desirous of receiving advice on their advertising problems, the Editor has arranged to forward to me any advertisements which readers may submit for criticism, and any help I can render in the planning of campaigns and the preparation of booklets, folders, posters, etc., will be freely available to regular subscribers to THE ELECTRICIAN.

At the outset it may be pointed out that in few trades is the retailer so well served with manufacturers' sales helps as he is in the electrical trade. There is hardly a product in the electrical contractor's stock which has not been well and consistently advertised on a national scale by the manufacturers. On the hoardings, and in the great daily newspapers, these articles are brought to the notice of countless thousands of the public, and in such a way that a distinctly favourable impression is created towards the products advertised.

This ready-made interest in the goods which he has to sell is of incalculable benefit to the electrical contractor-retailer, and this fact cannot be over-emphasised. Thousands and thousands of pounds sterling are spent by electrical manufacturers annually in familiarising the public with their wares, but a considerable proportion of this expenditure is ineffective, and will continue to be so long as the last link in the distributive chain, the electrical retailer, fails to make the fullest possible use of this valuable assistance.

There is no cure without diagnosis, and the surgeon's probe sometimes hurts. But it remedies the diseased body. Applying the probe in this case, we find conclusive proof that the British electrical manufacturer not only makes a superlative product, and sells it to the trade, but he also sells it *for* the trade to the general public and pays the retailer for doing something he might almost as easily have done himself. It is useless to shut our eyes and ears to facts of this kind, for unless the retail side of the electrical industry can make itself an efficient re-seller of the manufacturers' goods, the manufacturer will one day decide that it is better and cheaper to complete the chain of distribution of his products without the intervention of the factor and retailer.

The stupid notion that selling things in a shop is an undignified proceeding for an electrical engineer has been responsible in the past for most of the inertia on the retail side of the industry, and it is remarkable that the idea still persists in many cases.

Quite recently, for instance, I had occasion to enter a shop of an electrical contractor for some small requirements. The shop, situated in a busy thoroughfare, was tended by the contractor's wife, who divided her activities between the house and the shop, and knew practically nothing about the business, or the disposition of the meagre stock that was in evidence.

Her husband, I learnt, in conversation, was out seeing to a wiring job which he had secured at a cut price on a Council's housing estate, and in any case he didn't bother much about the shop side, as the average week's takings only amounted to a pound or two!

Although I believe this to be an extreme case, I do believe that there are many electrical contractors up and down the country who do not look upon shop sales as a lucrative and important part of the business, and regard it as a side-line.

Now, this will not do. As electricity becomes available to more and more people, the manufacturers will produce and seek to sell ever increasing quantities of domestic electrical appliances. At the same time, many supply engineers who have hitherto been mainly concerned with generating problems, will cease to generate, and will turn to the marketing of energy-consuming devices. If, therefore, the electrical contractor wants to keep his place in the sun, he must sell electrical appliances, and he must sell them on a scale far beyond anything he has done before. Otherwise someone else will do the selling for him—but without passing him a commission for work he has not done.

How to increase sales of domestic electrical apparatus? There is but one answer—advertising, and yet more advertising. I use the word advertising in its proper sense of "making known," and though I count newspaper advertising as a very necessary feature, I also consider window dressing, circular letters, the circulation of pamphlets, etc., to be important branches of advertising. All should be used and incorporated in a co-ordinated sales policy to secure best results. It is, for instance, a waste of money to advertise refrigerators in the local newspapers, and show fires in the shop window. The window display should always link up with any Press advertising that is proceeding, as people who have noticed an advertisement are pre-disposed to examine the goods advertised if they are prominently displayed in the window. Although I intend to deal more particularly in these articles with newspaper advertising, I would like to emphasise that window space, if properly used, is a valuable advertisement. It is free in the sense that its cost is included in the rent of the premises, and it costs nothing to advertise in such a way that it will actually sell goods. If it is not so used it represents a real monetary loss, and a definite addition to the total overhead charges. Readers should, therefore, bear in mind that their windows should always reflect in some way, the work that is being done in the newspaper.

The Advertising Appropriation.

I am often asked to give a figure which would represent the sum which should be spent on advertising by a retailer. Without knowing the individual's turnover and other particulars, such as the extent of local competition, the potentialities for increased trade according to the state of saturation of the market, the price of electricity, and so on, it is extremely difficult to arrive at a figure.

Some advertisers can get remunerative publicity by a mere expenditure of only 1% of their annual turnover; others require to expend 10% or more. The exact proportion which you will require to be put aside for advertising must be determined by the local conditions. The only thing to fear in making the decision, is that you may spend too little—and not too much.

One thing, however, is important. You cannot get good results from occasional and spasmodic advertising. Much of the value of publicity lies in its cumulative effect, and, if you fail to carry on the work, a proportion of the expenditure already made will prove useless.

It is important, therefore, to plan a series of advertisements to cover a definite period and decide on a plan of campaign at a definite cost, and adhere to it strictly. A percentage of the main sum should be put on one side for contingencies, so that

Digitized by Google

the unexpected holding of a local exhibition or some other unexpected item calling for special publicity, will find you prepared to take a special advertisement without interfering with the pre-determined campaign.

When the extent of the advertising campaign has been decided, it is necessary to determine the papers to be used, and the space to be occupied in each. As to choice of media, the advertiser's knowledge of local conditions makes this a fairly simple matter, though it is sometimes possible to be led into unprofitable expenditure by taking space at uneconomically cheap rates in the weaker of two newspapers. The paper asking higher rates for its space may, and usually can, justify itself in larger and more suitable circulation, better printing, etc. Placing an order in advance for a series entitles the advertiser to a useful reduction on the unit rate, and is to be recommended; pre-payment of the whole series, when possible, also provides a further discount in many cases.

The size of the space to be taken again depends on individual conditions and requirements, but it must not be thought that advertising in comparatively small spaces will necessarily be ineffective. The full-page advertisement can hardly fail to produce results, however badly it may be filled. Intelligent use of smaller areas will also produce results.

[*To be continued.*]

ELIMINATING THE UNFIT IN CONTRACTING.

The "Fishy" Electrical Contractor—More Publicity Wanted—Supply Authorities' Lack of Inspection—Warning to Fire Insurance Companies—Cotton-covered Bell Wire for Lighting Installations—More Examples of Shoddy Work.

By HARRY MOSS, A.M.I.E.E.

IN prosecuting my campaign for the elimination of the unfit and for the uplifting of the electrical contracting industry, it daily becomes more evident that the process of cleansing the trade has been far too long delayed, and the evidence in favour of the prosecution is piling up by leaps and bounds. The National Register is now doing a good deal through its publicity campaign to educate architects, builders, and the public, generally, to the importance of having electrical work done by skilled and competent firms or individuals, and it is anticipated that the long overdue publicity campaign of the E.C.A. will shortly be launched.

This organisation has been lacking in its duty in not entering the field long before now, but, as the old saying is "Better late than never," it is to be hoped this big national organisation will not lose any more time, but will get to work on the all-important question of preaching the gospel to the public, of the absolute necessity of all electrical work being done by reputable firms, and condemn publicly the shoddy, cheap, and dangerous work of the "jerry" contractor and kerb-stoner.

If this is done in a vigorous manner, it may not be too much to hope that E.D.A. will also enter the field in one of its campaigns, and bring some of its guns to bear on the common enemy.

"Codding" the Public.

A few days ago I passed a small shop with the man's name over the door, and on one side of the name it said "High Class Fish and Fruit Stores"; on the other side, "Electrical Contractor." It made me wonder how long he had been "codding" the public! There was no visible sign in the shop that the title "Electrical Contractor" should have had a "plaice" there at all. I wondered what was the wording of his trade cards and memos., and how many so-called factors and agents were calling on him weekly, and if his electrical business was 5% of his total turnover.

There must be some weeding out done, as, with the great developments now proceeding throughout the country, there is likely to be a larger influx of these incompetents into an industry which properly belongs to the trained electrical engineer.

Case after case keeps coming up where work is done by the "jerry" man, simply because he is cheap, and the customer does not realise, until it is too late, that he has got a very poor job, consisting of the cheapest class of wire and accessories, put together by an amateur.

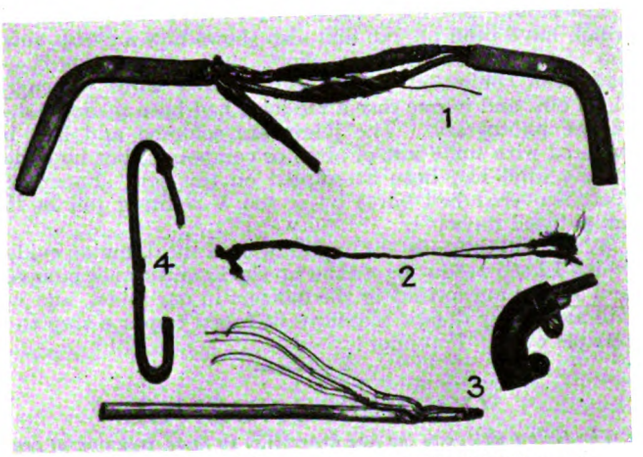
An argument often used by these people is the one that "I can fit your place up and give you electric light for, say, 9s. 6d. or 10s. per light, so why pay more?" and the prospect, not knowing any better, gives the work to the lowest-priced man or firm.

There will have to be a very intensive propaganda campaign by the recognised associations, to educate the public, and combat this cheap, shoddy work.

Some supply authorities are helping very much already, but it is high time they all came into line and did something more, because it is very detrimental to the industry as a whole to have these low-grade faulty installations put in, which cause irritation and annoyance and often considerable further cost to the customer, which reflects detrimentally on the trade.

It is no credit to any supply authority to connect "shoddy" and unreliable installations to their mains. It is not "all right" to keep on adding these installations for the sake of increased output, if danger is present. The supply people have a duty to the industry in this matter, and should not shrink from it. When exposures come about through faults occurring, they should take steps to find who the culprit is and "warn him off."

The examples and illustrations accompanying this article



Figs. 1 to 4.—Some newly discovered examples of bad installation work.

are evidence of what is being done, and which ought to be put a stop to.

Fig. 1 on the first photograph is an example of how a 3/029 L.C. wire was tapped and connected up to a radiator plug, taking 15 A, the only insulation at the joints being a little black adhesive tape. No bonding had been attempted or done, and a burning out was the result. Is it fair or reasonable that electricity consumers should have to run these fire risks?

Fig. 2 shows the result of running a 1 kW radiator on a thin V.I.R. 14/0·0076 flexible. Can you wonder at fuses blowing or fires occurring?

Fig. 3 is a twin 1/0·044 metal sheathed wire which had an earthing wire connected to the earthing pin of a heating plug. The earthing wire was passed through the ⅝ elbow shown, and connected to the gripping screw. The tube, however, was not earthed, nor was the sheathing of the twin wire, with the result that a fault on the heating apparatus made the sheathing alive, the current taking the nearest path to earth, via a gas pipe, with the usual disastrous results, as the gas was soon ignited. This would, I expect, be called an electrical fire.

Closer Inspection Needed.

Fig. 4 is not shown as bad electrical work, but is a metal sheathed wire that has been pierced with a nail by a careless joiner. The nail was in contact with the neutral conductor and the sheathing, causing a dead earth on that side, but as the supply authority did not trouble to test—which, of course, shows a lack of inspection on their part—the job was connected

Digitized by Google

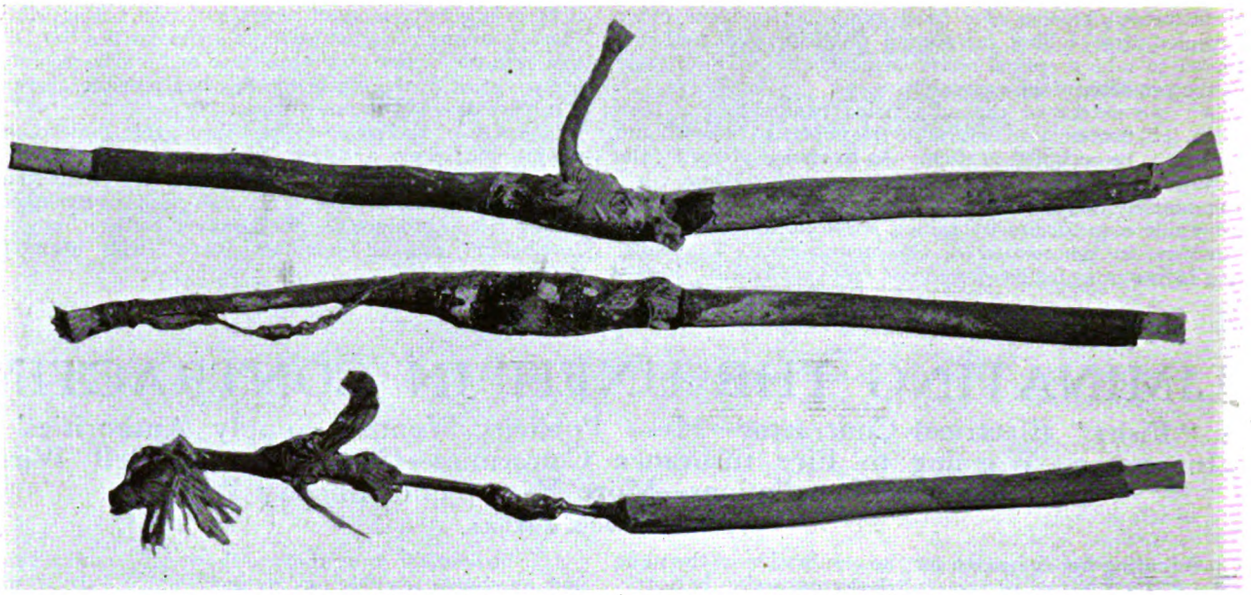


Fig. 5.—Showing further examples of shoddy wiring on a 100 V installation.

up, and worked for some time before being found out. It is also safe to assume that the cheap "jerry" contractor who did the job did not test, either—otherwise he would have found it—but it is also possible that his "plant" does not include a testing set more advanced than a bell and dry battery.

The illustration, Fig. 5, shows wires from a 100 V installation, which have been buried, and also shows how a cheap, shoddy job is done when wire runs short. The cotton-covered wires had been connected to the lead-covered wires to lengthen them out, and in one case a tee joint had been made as shown in the photograph. The joints are soldered, and had been covered with some sort of pitch or compound, but no bonding of any kind had been attempted on this job. Fancy using cotton-covered bell wires on a 100 V lighting job in these enlightened days!

When will the constant exposures and the damning evidence which I keep producing waken up the fire insurance companies and supply authorities to the dangers in our midst, and when will some very drastic measures be taken to put a stop to this terrible evil? I wonder!

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Fool-proof Chargers.

[To the Editor.]

Sir,—I note in "Current Topics," in your issue of March 29th, a paragraph dealing with home chargers for wireless accumulators, in which you call attention to the necessity of making such devices as simple as possible to handle. This has always been a point on which we hold decided views, and I think that we can claim that our standard trickle charger fulfils your requirements. In one respect it is possible that the

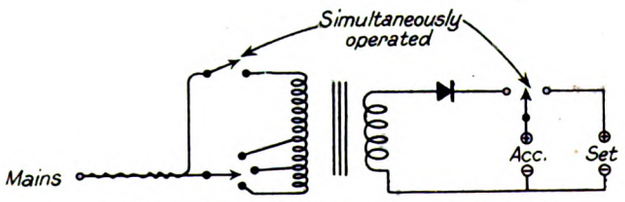

Diagram of connections of the trickle charger referred to in the accompanying letter.

apparatus is not entirely fool-proof; in order to cope with variations of supply voltage, it is necessary for the user or the retailer who supplies it, to select one of three terminals marked with the mains voltage.

It is also necessary that the purchaser refrain from connecting the instrument to direct-current mains. Otherwise, we are of the opinion that the instructions sent with the apparatus do make it substantially fool-proof. You will notice from the accompanying diagram of connections that even in the event quoted by you, of the instrument being left switched on to "Charge" while disconnected from the mains, the accumulator cannot discharge back through the rectifier, owing to the high "back resistance" of the Westinghouse rectifier employed. Further, the switching is so arranged that there is no possibility of the mains being connected to the set, except, of course, in the case of a complete breakdown of the whole apparatus, which would probably then blow the fuses, and so still be safe.

It may be noted that since the use of 2 V valves usually calls for rather larger discharge rates from the accumulator than the use of 6 V valves, the charger is arranged to supply rather greater current to a 2 V accumulator. The actual values are, when the correct a.c. voltage is applied, approximately 0·45 A for 2 V and 0·32 A for 6 V. A 10% rise or fall in applied voltage causes approximately a 10% rise or fall in the charging current, and cannot, in any way, injure the charger or the accumulator. I have pleasure in enclosing a sample of this instrument for your inspection.—I am, etc.,

P. K. Turner
for Graham Amplion, Ltd.

Slough.

[We have examined the charger submitted, and agree that so long as the instructions as to terminal arrangements are observed, no harm can be done to an accumulator during charging, discharging or stationary periods. The charger is fitted with a substantial knob, by means of which the accumulator may be connected "to set" or "charge," or "off," which thus reduces to a large extent the possibility of the instrument being left switched on to "charge" while disconnected from the mains. In the event of such a case, however, the resistance of the Westinghouse rectifier circuit is such that the accumulator will not be harmed.—Ed.]

Educating the Public.

[To the Editor.]

Sir,—In view of the excellent work that is being done by the National Register in the direction of educating the public about the dangers of shoddy wiring installations, it is difficult to understand why the April issue of the official journal of the Electrical Contractors' Association should feel the necessity to announce "that the E.C.A. has a special committee sitting at this moment to consider ways and means whereby architects and others might be persuaded to see the folly of encouraging the shoddy worker to continue his evil malpractices." The E.C.A. must surely be aware that the National Register has already put in hand a plan on these lines, and that it has met with gratifying success.—I am, etc.,

Regtract.

London, S.W.11.

Every shareholder is a potential customer.—*Sir Hugo Hirst.*

NEWS IN BRIEF.

Stockholm's Profitable Public Utilities—Swansea's Hire and Hire-Purchase Schemes—The Ashchurch Railway Accident—Paignton Summer Illuminations.

A NEW type of telephone instrument is to be introduced by the Post Office.

A telephone engineer is required by the Egyptian State Railways Telegraphs and Telephones Administration.

Ten million kroner, instead of the estimated sum of three and a half, were returned to the Stockholm City from its municipal electricity, gas, and water works.

Swansea Electricity Committee has adopted a hire and hire-purchase scheme.

A set of traffic light signals is to be placed at Morriston Cross, Swansea, at a total cost of £110, including wiring and installation.

The Farringdon Dispensary's clinic for artificial sunlight treatment, at Parker Street, Kingsway, London, was opened on April 10th.

Stretford Electricity Committee has discussed the possibility of obtaining an electrical showroom in the Old Trafford area, and has adjourned the matter, pending consideration by the chairman.

At a public meeting of the North Wales Ladies, at Colwyn Bay on April 11th, it was resolved to promote the idea of the all-electric home, and to advocate the teaching in the day-schools of domestic electrical methods.

The first meeting of the Bristol and District Branch of the Electrical Association for Women, was held on April 11th, when Mr. G. S. Francis, of the E.D.A., gave a lantern lecture dealing with architecture and lighting. The Birmingham and Midlands Branch of the Association visited the Birchills power station on April 11th.

LOOKING BACKWARDS.

FIFTY years ago the issue of THE ELECTRICIAN, *dated April 19th, 1879, recorded that :—*

The Society of Telegraph Engineers was recommended to enlarge the scope of its proceedings to include those of an Electrical Society.

M. Ader claimed to have made a telephone speak without a diaphragm.

The Council of the Royal Albert Hall was organising an exhibition to be "historically illustrative" of the subject of electric lighting.

Edison's search for an incandescent electric lamp had brought him to the stage where a lamp containing a regulator for "turning the electricity on or off" was incorporated, "the expansion of the air in the globe serving to work it." It was admitted that the "invention" was not ready for the public.

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *of April 22nd, 1904 :—*

For using a ship fitted with wireless telegraphy apparatus, "The Times" Russo-Japanese war correspondent was threatened by the Russians with treatment as a spy should the vessel come within the zone of operations of the Russian Fleet.

Papers announced for the ninth annual convention of the I.M.E.A. at Derby included one on "The Commercial Practicability of Electric Traction by Surface Contacts."

The A.E.G. English Manufacturing Co., Ltd., was a new company formed to acquire United Kingdom rights in the "Nernst" lamp.

There are now 790 electricity consumers in Skipton.

Alderley Edge and Wilmslow Electricity Board has invited tenders for the erection of an electricity sub-station at Wilmslow.

The Western Union Telegraph Co. commenced a new service of postal letter telegrams on Monday between Great Britain and Ireland, and Canada, Newfoundland and St. Pierre Miquelon. The charge is 1½d. per word, minimum 2s. 6d.

Paignton Entertainments Manager has been instructed to obtain a quotation for strip lighting for extra illumination at the band enclosure during the summer season.

Birkenhead Museums Committee has had drawings prepared showing a scheme for diffused lighting at the exterior of the gallery entrance, and the Committee has asked for the Electrical Engineer's observations on the proposals of the architects.

At the North-East Coast Exhibition, which will be opened by the Prince of Wales on May 14th, the exhibits will include inventions in regard to electrical engineering, telephony, telegraphy and radio, and demonstrations will also be given of electric lamp manufacture.

The annual meeting of the Mersey and North Wales (Liverpool) Centre of the I.E.E., was held on Monday, when Prof. E. W. Marchant was elected chairman. Mr. T. B. Morgan, vice-chairman; Mr. L. Breach, hon. treasurer; and Mr. Oscar C. Waygood, hon. secretary. Messrs. R. G. Devey, J. Hamilton, H. H. Harrison, and F. B. Mercer were elected committee members.

In his report on the accident which occurred on January 8th at Ashchurch, on the L.M. and S. Railway, Lieut.-Col. A. H. L. Mount states that he is satisfied that the electrical signalling, light repeater, and interlocking equipments were in order.

Members of the Birmingham and Midlands Branch of the Electrical Association for Women visited the works of the Electric Construction Co., Wolverhampton, on March 20th. The printing works of Kenrick and Jefferson, West Bromwich, were visited on March 25th.

At the meeting of the Overhead Lines Association on April 24th, at the Institution of Electrical Engineers, Mr. W. Fennell will give a "Review of Ferro-Concrete Poles in other Countries." This is to meet the convenience of Lt.-Col. W. A. Vignoles, who will give his lecture on "Getting Consumers in Rural Areas" on May 8th, at the same place.

At the annual general meeting of the Paisley Association of Electrical Engineers, on April 9th, Mr. Jas. Orr was elected president for 1929-30, Mr. Jas. E. Adam vice-president, Mr. J. M. Barbour, hon. secretary, Mr. G. H. Fisher, hon. treasurer, and Messrs. H. Aberdein, G. U. Campbell, J. Durell, J. S. Kilpatrick, F. E. Moss, and Alex Todd were appointed members of the committee.

An official statement was issued last week, following a conference between employers and representatives of the E.T.U., stating that the Electrical Trades Union had agreed to instruct members on strike in the federated engineering establishments to resume work pending a conference being arranged at an early date to consider an application for an advance of wages for men engaged on the electrical installation of lifts. It was also announced that the E.T.U. were instructing members who were out in connection with lift strikes and Grosvenor House to return to work forthwith.

At a meeting of the Association of Mining Electrical Engineers, at the South Wales Institute of Engineers, Park Place, Cardiff, on April 20th, Mr. H. T. Gregory will read a paper on "Three-phase Induction Motors and their Control Systems."

The New York Telephone Company announces that it will in future issue a five-volume telephone directory, one for each of the city's five boroughs. Greater New York has in the past issued its telephone directory in two volumes, containing more than 500 000 names.

Plans for the erection of a building to be occupied by the new X-ray department, consisting of an extension of the present buildings of the Western Infirmary, were passed last week by the Glasgow Dean of Guild Court. The cost of the building, about £18 000, has been raised by public subscription, and Mr. Wm. Teacher has given £5 000 for the X-ray equipment.

The income of Guernsey States Telephone Department for 1928 was £19 219, working expenses were £5 463, and after provision for employees' pension fund, reserve for depreciation, sinking fund, etc., the surplus for the year was £718. The number of subscribers' and public telephone calls during the year was 2 607 855, an increase of 103 848. The number of subscribers at the end of the year was 3 636, increase, 158.

In a report on the North of Ireland telephone service in 1928, it is stated that the number of telephone stations on the system at December, 1928, was 21 404, the new stations connected numbering 1 205. The total number of residential stations was 4 514, an increase of 687. The rural areas received special attention. The department has decided to provide small automatic exchanges in suitable rural districts, and several of these will be completed this year.

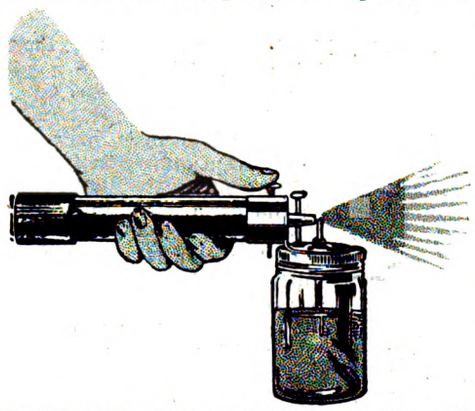
DOMESTIC ELECTRICAL APPLIANCES.

New Equipment for Domestic Use—Items of Interest to Electrical Contractors—Further Lines for the Radio Stockist.

WE have received from L. G. HAWKINS AND CO., LTD., 30/35, Drury Lane, Kingsway, London, W.C.2, particulars of an electric cleaner spray attachment which may be used for paint, disinfectant, germicidal liquids, etc. The unit is sold under the trade name of "Vio Ray" and may be attached to the hose extension of any good make of vacuum cleaner without further adjustments. The spray obtained from the nozzle is controlled by a conveniently placed trigger situated on the top of the connecting tube. The sprayer is of interest to all owners of vacuum cleaners and may be used for touching up furniture, internal decorations, damaged paint work on motor car bodies, fenders, etc.



The "Vio Ray" paint sprayer, by L. G. Hawkins and Co., Ltd.

LECTRO-LINX, LTD., 254, Vauxhall Bridge Road, London, S.W.1, have introduced to their already extensive range of hook and ring terminals two other types supplied in nickel plated and lead coated finishes. The latter type is of particular value for use on l.t. leads from accumulators to wireless receivers, as the lead coating will tend to reduce to a large extent, much of the unpleasant sulphating at the accumulator terminals. A condition which though unnecessary is, unfortunately, only too common.

A device for bonding and fixing metal sheathed cables is manufactured by Mr. H. H. LEAGE, of 46, Lincoln's Inn Fields, London, W.C.2, under the name of "Bonfix." This unit, which may also be used as a junction box for rubber insulated cables, is fitted with springs in such a way that they form part of the box. The cables are slipped under the springs without any further fixing, thus dispensing with binding clamps and screws. The box is provided with five positions for mounting while the cover is secured to the base by means of small springs.

Among the recent additions to the range of valves offered by the MULLARD WIRELESS SERVICE CO., LTD., of Mullard House, Charing Cross Road, London, W.C.2, may be mentioned the "pentode" valve P.M. 24. As its name implies, this is a five electrode valve designed for use in the last stage of low frequency amplifiers. It has three grids, that nearest the filament being the usual control grid. The next, or auxiliary grid, is connected to a terminal on the side of the valve base, and should be maintained at approximately the same potential as the anode. The third grid, nearest the anode, is connected internally to the filament. The control grid and anode, as in three-electrode valves, are connected to the grid and anode pins of the cap, so that the valve can be used in any set, the only addition necessary being a wire to connect the auxiliary grid to h.t. positive. This can be done by taking a flex lead from the auxiliary grid terminal on the side of the cap to the h.t. positive terminal of the set which supplies the h.t. to the last valve. By this arrangement, an high amplification factor of 62 has been obtained in conjunction with a mutual conductance of 2.3 mA/V. This makes the P.M.24 a useful valve for the last stage or output valve in low-frequency amplifiers. Used for this purpose, it gives an amplification and output almost equivalent to two l.f. stages employing normal three electrode valves. It must, however, be borne in mind that the P.M.24 should not merely be substituted for a super-power valve in the output stage of an l.f. amplifier where full loud-speaker volume is already obtainable. In such a case, the valve would be overloaded, and the preceding l.f. stage should therefore be omitted. The filament voltage is 4, the consumption 0·15A, anode voltage 150, auxiliary grid voltage as h.t., impedance 28 000 Ω, amplification factor 62, mutual inductance 23mA/V. We have tried one of these valves in a conventional a.c. mains 3-valve receiver and the volume obtained was in accordance with the manufacturer's claims. The valve appears to be able to carry a reasonably heavy load without distortion, while on distant, and consequently weaker, stations the amount of amplification was a little under that given by two normal l.f. stages.

R. PEARSON AND SONS, 369, Holcombe Road, Greenmount, near Bury, have introduced a new lamp holder which, fitted with two sockets besides the usual bayonets, can be used as an adaptor with the lamp still in circuit. The device is made with two sockets so situated in the body of the contrivance that a special two-pin plug, supplied by the makers, may be used for connecting any domestic appliance into the circuit. The holder normally carries a two-pin bridge which can be used, if desired, for controlling the lamp circuit. Removal of this bridge, permits the two-pin plug of the appliance to be inserted. The holder is also fitted with a firm cord grip of novel design.

A new cooker added to the range offered by the MANOR ELECTRIC OVEN AND FIRE CO., of 303, High Road, Chiswick, London, W.4, is a 1 200 W model giving a cooking space of 12 in. by 12 in. by 11 in. Three heat control is included, while the oven elements, of the enclosed type, are situated in the corners. The boiler-grill of 1 800 W loading is of the

Examples of the range of fittings offered by Camille Espir, Ltd., 19, Hanover Square, London, W.1. The centre fitting is made in wrought iron and the remaining two are of wood.

Digitized by Google

standard "Manor" plug in type and is also arranged with three-heat control. The overall dimensions are 19 in. by 28 in. wide, and 15 in. deep.

An electrolytic type of condenser has just been placed on the market by the TELEGRAPH CONDENSER CO., LTD., Water Farm Road, North Acton, London, W. The chief use for this type of condenser is for smoothing a.c. ripple when such current is used for the direct heating of valve filaments. They may also be used for eliminating ripple in the case of moving coil loud speakers. The minimum capacities are 4 000 μF and 2 000 μF, for double and single types respectively, measured at 50 cycles. The minimum working peak pressure is 12 V at which the maximum leakage is said to be 10 mA. The condensers are of the dry polarised variety, fitted in the usual metal boxes, and provided with small terminals. The latter are clearly marked as to polarity and a substantial base for baseboard or other mounting is provided in each type.

A new electric cooker offered by BERRY'S ELECTRIC (1928), LTD., Touchbutton House, 85–87, Newman Street, London, W.1, is of such a type that grilling can be normally carried out in the oven, thus eliminating to some extent any fumes and smell. It is claimed that the efficiency of the totally-enclosed hotplates used is higher than normal, while the cooker is fitted with a separate compensating thermometer for controlling the temperature of the oven. The boiling plates are adjustable and removable pull-out type elements are fitted.

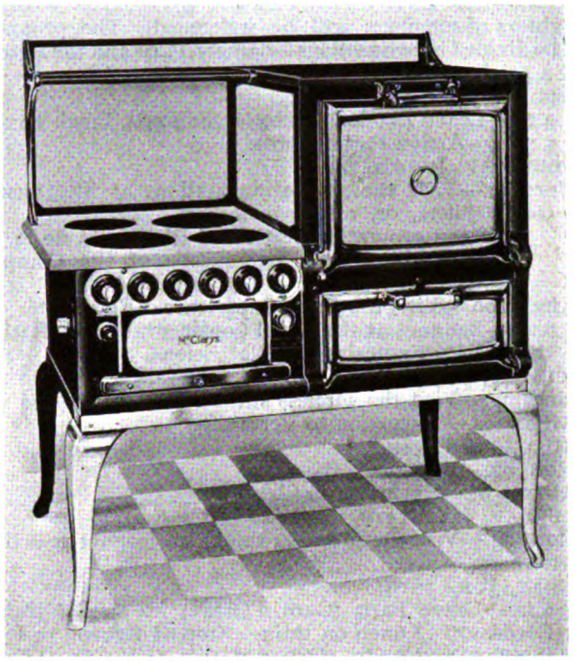
In connection with the recent discussion of the value of ray therapy it is interesting to note the sale by METRO-VICK SUPPLIES, LTD., 155, Charing Cross Road, London, W.C.2, of a massaging device which is termed a companion apparatus to artificial sunlight appliances. This is the "Savage" health motor, which consists of a small electric motor arranged to oscillate a belt, whose surface is applied to the lightly-clad body of the person requiring treatment. Ordinarily, both ends of the belt are attached to the machine, and the operator slips into its embrace; an alternative method is to remove one end of the belt from the hook, and hold it in the hand with the belt twined round the body. The appliance is designed as a body conditioner and a corrective of specific ailments, and is recommended to all who do not obtain sufficient physical exercise. Its use is also suggested as a remedy to obesity. The degree of severity of the vibratory action is proportional to the force applied against the belt. The motor can be run from any lamp socket, and the machine is entirely portable, a leather case with a handle being provided for packing it. In weight and size it is comparable with a portable electric sewing machine.

CAMILLE ESPIR, LTD., of 19, Hanover Square, W.1, have in their showrooms two ranges of lighting fittings in period designs in wrought iron and wood, and modern, French glass pendants and wall brackets. In addition, there are fittings of British manufacture, and, as an example of these, one can cite the "ball" fitting, which is sold in three sizes. A shell bracket offered is mounted with oxidised silver castings, and is provided with a ceiling plate to match. Another hanging model caters for 8 lamps: 4 inside the double-concave glass panels, and 4 20 W lamps outside, supported by brackets. There are also many fittings to suit those desiring the ultra-modern, the soft appearance of the glass used by this firm being particularly attractive.

The EXCELSIOR COMMERCIAL CO., LTD., of 112–113, Fenchurch Street, London, E.C.3, is putting on to the market a cleaner which is in several ways superior to the old model, and though the new improved "Praefix" is not yet available to the public, the following particulars have been obtained. Like the former model, the cleaner is of the small, lightweight, non-bag type. The body can be had in leatherette or in corrugated aluminium. The $\frac{1}{4}$ H.P. motor is suitable for a.c. or d.c., has a suction power of 580–600 mm. (watergauge), and is provided with ball bearings of the tightly enclosed type, requiring no oil or grease. All parts are accessible, and as the field and the armature bearings are clamped to crossbars connected to the housing, vibration is claimed to be practically nil. The accessories consist of carpet and furniture nozzles, a polishing brush, and a small triangular-shaped brush for corners and picture rails; to these is added a fish-tail piece made of vulcanite. The external suction pipe is of light and durable construction; the pipe can be supplanted by a metal tube 4 in. long, and the machine then operated with the handle on the motor housing. The weight of the machine is approximately $7\frac{1}{4}$ lb.

HOBBIES, LTD., of Dereham, Norfolk, are offering a new electric motor for driving their "A1" or "Triumph" fretwork machines. The method of changing from foot treadle to electric drive consists merely of changing the belt. The starting switch is in a foot box to be set on the floor and 12 ft. of flex with the necessary wall plug are supplied ready for connection to the mains.

The "Photomirenta" lamp, manufactured by PHILIPS LAMPS, LTD., Philips House, 145, Charing Cross Road, London, W.C.2, is an innovation designed both to simplify and lessen



One of the new "McClary" cookers of Berry's Electric, Ltd.

the cost of night portraiture for the amateur and professional photographer, by largely taking the place of magnesium and arc lamps. It consists of a 500 W gasfilled opal lamp, having half of the bulb silvered inside to form a mirror, this increasing the intensity of the light in one direction. The bulb itself is made of "Argenta" opal glass, and renders the use of diffusing screens unnecessary. The "Photomirenta" lamp can be plugged into the ordinary lighting mains, and be used without a fitting of any kind, as all the light is directed towards the sitter and no rays fall on the camera lens. With a fast panchromatic film, and a 4·5 F lens, an exposure of only one second is necessary, while a little experiment enables the photographer to estimate with accuracy the exposure required for different subjects.

The ELECTRICAL FITTINGS CO., the agents for the ARTISTIC LAMPSHADE MANUFACTURERS (of 58, Pentonville Road, London, N.1), is exhibiting in the showrooms at 58, Newman Street, London, W.1, a variety of attractive pendants, standard lamps, and table lamps. "Nacrolaque" appears to be employed in all the designs, and the table lamps are particularly novel, traditional designs being abandoned completely in many cases. One model is in the form of a lily, open at the top and with no conventional shade; the outer leaves of the lily shield the lamp from the eye. The octagonal base is made of the same material, and contains a concealed metal weight heavy enough to ensure the stability of what would otherwise be a featherweight lamp. Another model represents a vase with a flared opening. There is a fuchsia, available as a pendant or table lamp, with outstanding colouring. The stamens add to the realistic appearance of these flower-like standards. The columns of larger lamps are also worthy of notice, since externally they are made entirely of Nacrolaque in pleasing colours. Some of the pendants have an appearance resembling that of mother-of-pearl.

A new feature is incorporated in the "Labor" industrial lighting fitting of BRITISH B.A.G., LTD., 23, Farringdon Avenue, London, E.C.4, whose "Pearlite" diffusers have recently attracted attention. The "Labor" fitting is made of heavy gauge sheet metal, vitreous enamelled white inside and either black or grey outside. The innovation consists of a removable diffuser, in shape partly spherical with a flat base, which is placed over the lamp and attached to the upper part of the fitting by chains. The lower half of the diffuser is internally silvered, so that it acts as a partial reflector.

I.E.E. SUMMER MEETING.

Preliminary Details of the Meeting in France Next June.

AS has been already announced in THE ELECTRICIAN, the summer meeting of the Institution of Electrical Engineers will this year be held in France at the invitation of the Société Française des Electriciens, and the presence of wives and daughters of members will be welcomed. The programme will be divided in two sections—namely, Paris and the Pyrenees, and a brief outline of the arrangements is as follows :—

TUESDAY, JUNE 11TH.
9 a.m.—Leave London (Victoria) for Paris, lunch en route.
4.5 p.m.—Arrive Paris (Nord).

WEDNESDAY, JUNE 12TH.
Morning.—Visit the generating stations at St. Ouen and Gennevilliers, or, alternatively,
Visit the generating station of Electricité de la Seine and the Milton-Volt Laboratory of the Compagnie Electro-céramique.
Afternoon.—Visit the Ecole Supérieure d'Electricité.
8 p.m.—Banquet at the Hotel Continental by invitation of the Société Française des Electriciens.

THURSDAY, JUNE 13TH.
Morning.—Visit the wireless station at Sainte-Assise.
Afternoon.—Excursion to Versailles.

FRIDAY, JUNE 14TH.
Morning.—Free.
Afternoon.—Excursion to Chantilly.

SATURDAY, JUNE 15TH.
Morning.—Visit the 46 000 gauss electro-magnet at Bellevue.
Afternoon.—Free.

SUNDAY, JUNE 16TH.
9 a.m.—Leave Paris (Gare d'Orsay) by special train for Bordeaux. Lunch on train. Stop at Eguzon to inspect the dam and hydro-electric station at the Paris-Orleans Railway, which is connected by a 150 000 V line to the Union d'Electricité and supplies the suburbs of Paris and the Paris-Orleans Railway. Dine on train and arrive at Bordeaux about 10 p.m. Sleep at Bordeaux.

MONDAY, JUNE 17TH.
12.30 p.m.—Train leaves Bordeaux for Pau. Lunch on train.
5 p.m.—Arrive at Pau.
Evening.—Dinner (morning dress) offered by the South-Western Local Centre of the Société Française des Electriciens. Sleep at Pau.

TUESDAY, JUNE 18TH.
9.am. Leave Pau by motor coach to visit the Houra generating station and an automatic sub-station. Lunch at Eaux-Bonnes.
4 p.m.—Leave Eaux-Bonnes by motor-coach and proceed to Lourdes via the Col. d'Aubisque. Dine and sleep at Lourdes.

WEDNESDAY, JUNE 19TH.
9 a.m.—Leave Lourdes by motor-coach for Pierrefitte-Nestalas. Excursion to and lunch at Gavarnie. Return to Lourdes about 7 p.m. Dine and sleep at Lourdes.

THURSDAY, JUNE 20TH.
12 noon.—Train leaves Lourdes for Toulouse. Lunch on train.
4 p.m.—Arrive at Toulouse. Dine and sleep at Toulouse.

FRIDAY, JUNE 21ST.
9.25. a.m.—Leave Toulouse by train for an excursion to the old city of Carcassonne. Lunch at Carcassonne.
Arrive back in Toulouse at about 7.30 p.m. Dine and sleep at Toulouse.

SATURDAY, JUNE 22ND.
10 a.m.—Leave Toulouse for Paris. Lunch and dine on train.
10 p.m.—Train arrives at Paris. End of meeting.

The Institution is informed that those members who so desire may take part in the concluding meetings of the International Conference on Large High-Tension Supply Systems at 9, Avenue Hoche, Paris, on Thursday, June 13th, and Friday, June 14th, on payment of a reduced entrance fee of £1, which should be sent direct to M. Tribot Laspiere, Secrétaire Général, Conférence Internationale des Grands Réseaux Electriques à Haute Tension, 25, Boulevard Malesherbes, Paris.

For those ladies who do not wish to take part in the technical visits, arrangements will be made for visits to some well-known dressmakers' shops and jewellery establishments, where models (mannequins, etc.) will be on view.

PERSONAL.

ALD. J. Thickett has announced his resignation from Walsall Electricity Committee of which he has been chairman since November, 1922.

The telephone department of the Bicester, Oxon, Post Office presented a case of spoons to Miss Ada R. Wainwright on the occasion of her marriage to Mr. Fred Inwood.

Chester Electricity Committee has appointed Mr. E. F. Humphrey, of Birmingham, as an additional mains superintendent, at a basic salary of £324 7s. 11d. per annum.

Ald. T. G. Lumb, chairman of Blackpool Electricity Committee, has congratulated Mr. C. Furness, the borough electrical engineer, on the success of the last autumn illuminations.

Mr. W. L. Hambly, late heating and cooking representative with the British Electric Transformer Co., has joined the staff of Credenda Conduits Co. as sales engineer for London and South-West England.

The Earl of Midleton has been elected chairman of the Globe Telegraph and Trust Company. Mr. Francis Alexander Johnston has joined the board to fill the vacancy created by the death of Sir John Denison-Pender.

Kingston-on-Thames Town Council has granted an honorarium of £500 to Mr. T. A. Kingham, borough electrical engineer, for himself and certain members of his staff, in recognition of services rendered in connection with the laying of a cable from the borough boundary to Walton-on-Thames.

Wrexham Town Council has increased the salary of Mr. J. W. Williams, borough electrical engineer, from £455 to £500 per annum; that of Mr. E. O. Jones, station superintendent, from £5 per week to £300 per annum; and that of Mr. J. Archer Tippett, consumers' engineer, from £4 10s. to £4 15s. per week.

Mr. D. L. Thornton has been appointed editor of the "Mechanical World and Engineering Record." He served part of his apprenticeship with Cole, Marchent and Morley, Ltd., and has designed, among other plant, condensers of 46 000 sq. ft. capacity for use in power stations. Mr. C. N. Pickworth, who occupied the editorial chair for 40 years, retired last month.

Mr. Robert Shaw, who for 35 years has represented British Insulated Cables, Ltd., in the Manchester district, has just retired on pension. After an early training in the textile and calico printing industry, Mr. Shaw went into the electrical business. He was for some years on the staff of the International Okonite Co., Ltd., and left them in 1894 to start a branch office in Manchester for the British Insulated Wire Co., now British Insulated Cables, Ltd. Mr. W. H. Clift, who has been his chief assistant for 33 years, has been appointed to succeed him.

At a meeting of Aberdeen Tramways Committee last week, the following five were chosen as a short-leet for the vacant post of general manager of the corporation tramways:—Mr. W. W. Clark, engineer and manager of the Nottingham and Derbyshire Traction Co., and Midland General Omnibus Co., Ltd.; Mr. J. L. Gunn, manager of the Greenock and Port-Glasgow Tramways; Mr. H. H. Lancaster, traffic manager of Blackpool Corporation Tramways; Mr. Charles Symon, traffic superintendent, Aberdeen Corporation Tramways; and Mr. Alfred Smith, chief clerk and accountant, Aberdeen Corporation Tramways.

As a result of the Entrance Scholarship Examination held at Faraday House Electrical Engineering College on April 9th, 10th and 11th, the following awards have been made by the Governors of the College:—J. Rosenkrantz, Central Foundation School, London, the "Faraday" Scholarship of 50 guineas per annum, tenable for two years in college and one year in works; H. T. Horsfield, Erith County School, the "Maxwell" Scholarship of 50 guineas per annum, tenable for one year in college and one year in works; J. Ruston, Borden Grammar School, Sittingbourne, an exhibition of 40 guineas per annum, tenable for one year in college, and one year in works; J. Salomovitch, Central Foundation School, London, an exhibition of 40 guineas per annum, tenable for one year in college and one year in works; P. G. Chick, King Edward VI School, Norwich, an exhibition of 30 guineas per annum, tenable for one year in college and one year in works; A. M. Midgley, University College School, an exhibition of 30 guineas per annum, tenable for one year in college and one year in works; H. R. Rowbotham, Aldenham School, Herts, entrance prize of 20 guineas; R. W. Partridge, Repton School, entrance prize of 20 guineas; G. S. Pillans, Brighton College, entrance prize of 10 guineas.

Digitized by Google

OBITUARY.

MR. J. J. COOK, on March 28th, aged 29 years. He was manager of Darlington Corporation electricity showrooms.

MR. HERBERT SMITH, on April 6th, aged 46 years. He was for some years a member of the E.C.A. but gave up contracting a year or two ago and confined himself to accumulator work, and built up a big business in making and repairing motor car and other batteries and also magnetos.

MR. WILLIAM WORBY BEAUMONT, on Sunday, aged 80 years. He was for ten years joint editor of "The Engineer," but resigned from that position 25 years ago. He was vice-chairman of the London Electric Vehicle Committee, and among his published works are "Industrial Electric Vehicles," "Electric Motor Boats and Motor Cars" and "Modern Electric Practice."

MR. ARTHUR ERNEST ANGOLD, in a Birmingham nursing home on April 10th, in his 57th year. His death removes from the electrical profession a most gifted and brilliant engineer. Although he had not for many years enjoyed good health, he was engaged in his usual duties as recently as the previous Monday, and it was only within comparatively few hours of his passing away that serious symptoms were manifest, necessitating an emergency operation, from which he failed to recover. He was educated at the Birkbeck School, and received his earliest engineering training with Richardson of Gray's Inn Road, London, subsequently proceeding to Binko of Leadenhall Street, who traded largely in lightning conductors and bells. In 1890 he designed and made his first arc lamp at home, and as it met with the approval of Torr Todman, who had an engineering works in Bermondsey, he joined him and inaugurated an arc lamp department. The Todman-Angold arc lamp was first shown at the second Crystal Palace Exhibition. An early contract was for lighting the shops of a ready-made tailor in London, the installation comprising some 70 lamps, each taking 10 A on a 50 V 83 cycle circuit. This was the biggest arc lamp load on the mains of the old Deptford station, and probably the biggest electric shop lighting installation in London at that date. In 1892, the General Electric Co., desirous of developing its arc lamp work, arranged to take over the arc lamp department of Torr Todman, and thus Mr. Angold joined the firm to which he gave 37 years' service. He was first associated with Mr. Max Railing, in charge of the then existing Thames Street works, where, apart from arc lamps, various accessories were made, such as small transformers, choking coils, and liquid resistances, while one of their specialities was the Swinton-Angold cigar lighter. Some of the earliest Angold arc lamps made in the Thames Street works were for an exhibition in Bristol, while another installation about the same period was in Spiers and Pond's shops in Ludgate Hill. An interesting contract was that for liquid resistances controlling stage arcs in the Savoy Theatre. The three sets of liquid resistances for controlling respectively the red, white and blue batteries represented the biggest installation of its kind then existing in London. The original "Angold" open type arc lamps soon became known, and, in due course, the enclosed and flame type arcs were produced. He subsequently originated the idea of the magazine arc. He was also responsible for special studio and photographic arcs, but his most valuable contribution to this subject was made during the war, when his unique experience was applied to the development of special searchlight arcs for the Services. In particular, he devised mechanisms for simplified control, and developed a lamp capable of burning a "Beck" arc, whose essential feature was the use of flame carbons, with their burning ends surrounded by methylated spirit flames. Throughout his career, and more especially since the war, Mr. Angold contributed to the development of electrical machinery, switchgear and instruments in wide variety. Mention may also be made of his work in connection with automatic sub-stations. From many of his relays he abolished the moving coil, introducing moving magnets. His high-speed circuit breaker has also won warm commendation, while just prior to this death he had completed the design of a new line contact circuit breaker and was engaged in preparing a paper on line contacts as applied to circuit breakers, for presentation to the I.E.E., of which he was a member of long standing. See page 485.

Mr. Henry Nimmo, electrical adviser and superintending electrical engineer to the Government of Burma, has proceeded on eight months' leave, and Mr. J. H. Eades is officiating in his stead. His address while in England will be "Wingates, Matching Green, Harlow, Essex."

OVERSEAS TRADE.

Three Months' Exports of Electrical Goods Exceed Imports by £2 770 422.

UNITED Kingdom exports of electrical machinery, apparatus and material during March, 1929, amounted to £1 372 691, or £372 233 less than for the same month last year. Imports for the month under review amounted to £572 024, representing an increase of £56 527 when compared with the corresponding month of 1928. For the three months of this year, the total electrical exports amounted to £4 449 357, a decline of £324 460 when compared with the corresponding period of 1928. Total imports of the same goods during January, February and March of this year, amounted to £1 678 935, an increase of £110 160, when compared with the total for the same months of last year.

Electrical exports for March last exceeded imports by £800 667, while for the first three months of this year they were £2 770 422 in excess of imports.

Items which contributed to the decline of exports during March, were railway and tramway motors, with a decrease of £64 951, when compared with the same month last year, and other motors and generators with a decline of £35 401. Submarine telegraph and telephone cables were also responsible for a share in the lower total for the month, the decline under that item being £50 995.

On the import side, increases were chiefly due to materials such as rubber insulated wires and cables, £10 259, while telegraph and telephone instruments increased by £166 864.

The following are detailed figures:—

	Month of March		Three Months.	
IMPORTS.	1928.	1929.	1928.	1929.
	£	£	£	£
Electrical Machinery	157 772	149 803	446 244	427 237
Electrical Wires and Cables, Insulated,—				
Rubber insulated (not being Telegraph or Telephone Wires or Cables)	16 378	15 412	43 859	47 088
Insulation other than rubber (not being Telegraph or Telephone Wires or Cables)	45 327	44 035	135 032	145 291
Telegraph and Telephone Wires and Cables (not being Submarine Cables)	11 422	3 531	29 451	15 804
Submarine Telegraph and Telephone Cables	—	—	—	—
Telegraph and Telephone Instruments and Apparatus (except wireless valves)	49 045	98 297	150 582	317 446
Carbons, Electric	10 372	18 585	34 372	44 749
Electric Lamps and parts thereof—				
Electric Glow Lamps	42 542	49 101	169 231	92 350
Arc Lamps and Electric Searchlights	301	731	1 185	3 107
Parts Thereof (except Carbon Rods)	2 163	100	3 303	2 876
Batteries and Accumulators (including parts)	42 717	44 788	129 301	144 102
Electrical Instruments (other than telegraphic and telephonic): Commercial (including ammeters, voltmeters, etc.), House Service Meters, and Scientific	22 488	22,927	71 853	62 303
Switchboards, other than Telegraph and Telephone	328	157	394	1 208
Electrical Goods and Apparatus, all other Sorts	114 642	124 557	353 968	375 374
Total of Electrical Goods and Apparatus	515 497	572 024	1 568 775	1 678 935
EXPORTS.				
Electrical Machinery—	£	£	£	£

COOKING IN AIRCRAFT.

Specially Designed Electric Cooking Equipment for the R101.

THE Automatic Telephone Manufacturing Co., Ltd., Strowger Works, Liverpool, has just completed the manufacture of a special lightweight electric cooking and water heating installation for the new British airship, R101, now under construction at Cardington. The problem set by the Air Ministry, by whom the equipment was ordered, was no light one. Cooking accommodation for 100 persons was specified, the complete installation being restricted as to maximum permissible weight, and electric power available for this specific duty. Furthermore, due to the proximity of large volumes of hydrogen, all elements had to be rated for low current density, ensuring " black " heat at full load, and an absence of risk of ignition of any escaping gas. To this end also, all switch controls had to be of special design, in flame-proof enclosures, following the usual procedure for safeguarding electrical apparatus in collieries. The equipment—into the construction of which duralumin, the lightweight alloy, largely enters—comprises five separate items. The cooking range has four boiling plates, and an oven, 24 in. by 24 in. by 18 in. The two back boiling plates are each 8¾ in. diameter and of 1 500 W loading, whilst the front plates are each 7 in. diameter and loaded to 1 000 W. All are totally enclosed, and the hob plate is surrounded by a guard rail to ensure the stability of utensils placed upon it. The oven has two heating elements, each of 1 250 W, and the entire range is wired for three-heat control through the medium of a totally enclosed control switchbox, the supply being at 220 V, 100 cycles. There are three sliding rack shelves in the oven.

Steaming and Hot Water Systems.

A vegetable steamer with a capacity 18 in. by 22 in. by 24 in., is equipped with elements giving a total loading of 1 500 W, and is furnished with single heat control. It is fitted with removable wire tray baskets. A ball-valve tank is attached to the right-hand side of the steamer for maintaining a continuous supply of water to compensate for the evaporation loss. A hot cupboard measuring 3 ft. 6 in. by 1 ft. 10 in. by 2 ft. 8 in., is heated by elements totalling 2 000 W, and is equipped for single heat control. It has sliding doors, perforated metal shelves, and the top is recessed to function as a carving table and to facilitate the retention of plates, etc., placed upon it. To ensure a supply of hot-water for dish-washing, etc., a 40-gallon cylindrical hot water storage tank is provided. It is equipped with three immersion heaters, one of 1 000 W and two of 750 W loading, making a total of 2·5 kW. Smaller demands, for tea, etc., are met by a 3-gallon urn, equipped with two 750 W units, protected against burn-out in the absence of water by a thermal cut-out connected in series with their common junction.

Having regard to the importance of weight limitations it is interesting to record that the total weight of the completed equipment worked out within 10 lbs. of the limit set by the Air Ministry.

LEGAL INTELLIGENCE.

Judgment in Dispute Concerning Clutches for Electric Motors.

IN the King's Bench Division, on April 12th, Mr. Justice Talbot gave judgment in the action tried last term, brought by the Cooper Roller Bearings Co., of King's Lynn, against the Power Plant Co., of West Drayton. (See THE ELECTRICIAN of April 5th.)

His Lordship concluded his remarks by saying that there would be no formal judgment entered now, but ultimately plaintiffs would be entitled to judgment on the claim and counterclaim with costs. He left the parties to move for judgment when the actual amount to which it was found, after the reference, they were entitled had been ascertained. He did not know whether the case was going further or if the parties were likely to agree as to figures, but the result was to leave the parties to move.

Mr. Cyril Atkinson said he should in due course, after the amount had been determined by the Official Referee, apply for judgment for the plaintiffs on the claim and counterclaim with costs.

North Wales Power Co.

Mr. Justice Maugham in the Chancery Division on Monday, sanctioned a petition by the North Wales Power Co., Ltd., asking for a reduction of its capital.

Mr. Lionel Cohen, K.C., for the company, said the proposal was to cancel 10s. per share on each of the 383 883 issued ordinary £1 shares. The reduction was part of a scheme to reorganise the company with a view to raising fresh capital to enable it to carry out its duties under the new regional power arrangements. The company's capital was £1 000 000 divided into 500 000 each of ordinary and preference shares. Resolutions had been passed to sub-divide both classes of shares into 10s. shares, and converting the preference into ordinary shares. The capital would then be increased to the original amount by the creation of new ordinary of 10s. each. Among the terms involved in the reorganisation was one that the company should buy the hydro-electric undertaking of the Aluminium Corporation under certain conditions.

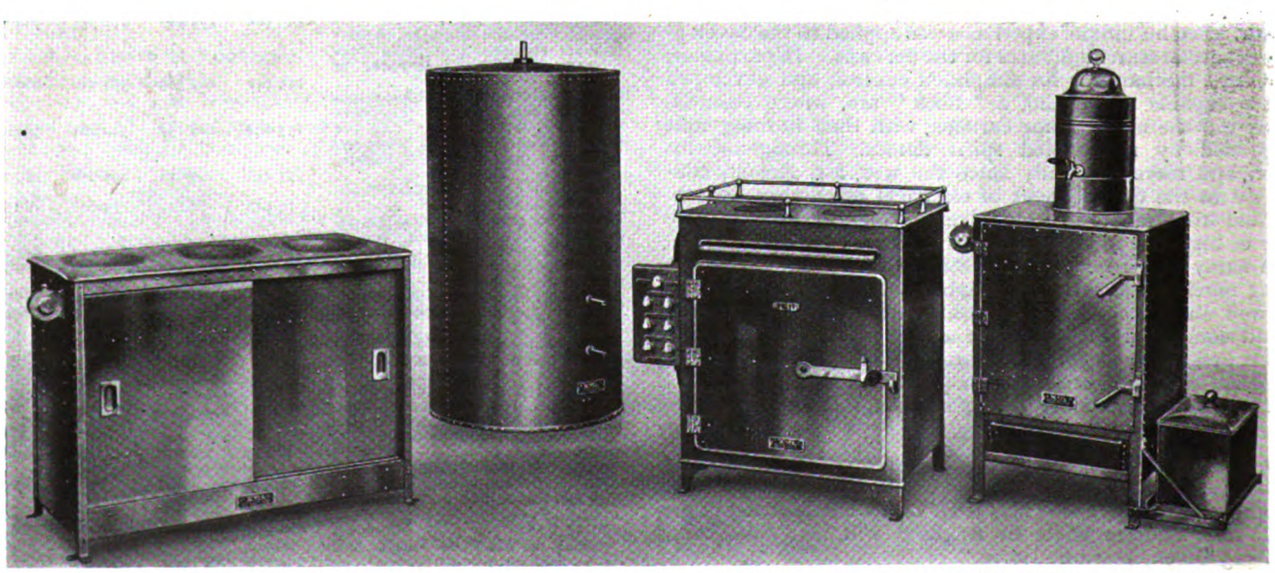
Marconi Company's Petition.

Mr. Justice Maugham in the Winding-up Court on Monday, made an order for the compulsory liquidation of the Zone Wireless Co., Ltd., on the petition of Marconi's Wireless and Telegraph Co., Ltd.

Lamp Patents.

In the Chancery Division on Tuesday, before Mr. Justice Luxmoore, the British Thomson Houston Co., Ltd., moved for judgment in default of appearance and defence against Harris's, of Shudehill, Manchester, in respect to the infringement by the defendants of letters patent concerning incandescent electric lamps, which patents have been upheld by the House of Lords. The plaintiffs asked for an injunction to restrain the defendants from infringing the patent, and also applied for an order that infringing articles be given up, and an inquiry as to damages.

The order asked for was made, with costs.



Some of the electrical equipment which was designed and manufactured by the Automatic Telephone Manufacturing Co., Ltd., for use in the airship R101.

RADIO TRADERS' MEETINGS.

An Approved List of Wholesalers—Date of Radio Exhibition Under Discussion—Valves at Cut Prices—The W.R.A. Making Progress—New Rules for Retailers—Improper Discounts.

TWO annual meetings of radio trade associations were held in London on April 10th. The first was the first annual general meeting of the Radio Wholesalers' Federation, which was preceded by a luncheon at the Connaught Rooms.

The chairman (Mr. E. W. Houghton), proposing the adoption of the annual report, mentioned that the membership was already practically 50, although this number might well have been doubled had not the Council paid strict regard to the principles upon which the Federation was founded.

One of the most important features of the Council's work was the compilation of an approved list of wholesalers which it was intended would ultimately contain the names of all genuine radio wholesalers. A large number of applications for inclusion on this list had been received, and one of the first duties of the new Council would be to go through these with a view to the preparation of the list.

The Chairman dealt with the R.W.F.'s negotiations with the B.R.V.M.A. upon a variety of subjects affecting the relationship between the members of these two organisations, and then passed to a review of the " reciprocal understanding " which had been effected with the W.R.A. The Federation's relations with the R.M.A. were upon an excellent footing, but somewhat hampered owing to the constitution of that body, which precluded joint negotiations upon several aspects of trade vital to radio wholesalers. The Federation was thus placed in the position of having to negotiate separately with manufacturers.

The adoption of the report was seconded by Mr. B. R. Banks. In the discussion that followed Mr. C. Orgel (Superlamp, Ltd.) urged that efforts should be made to secure that the Radio Exhibition should be held on a more suitable date from the trade point of view, or, alternatively, assuming that to be impossible, that a preliminary trade show should be held in May or June, a restriction being imposed that no goods be shown at the public exhibition not previously shown at the trade show. Such a scheme as this would afford wholesalers adequate time to arrange their season's programmes, and to have their catalogues up to date. Another suggestion by Mr. A. J. Rudd (The Esco Co., Norwich) was that there should be a trade day at the Radio Exhibition.

Mr. A. E. Harris (Harris and Russell, Ltd.) called attention to the fact that valves were still being sold at cut prices, which were obviously being obtained through irregular channels, and suggested that valves should be marked and boxed in a manner as to leave no doubt as to the source from which they emanated.

The constitution of the Council of the Federation is such that three members fall out each year. There were five nominations for the three seats, and on a ballot the following were declared elected :—Mr. E. H. Burris (Messrs. F. Burris and Sons, Bristol), Mr. E. U. Redway (Southern Motor Factors, Ltd., Eastbourne), Mr. J. W. Riddiough (Messrs. F. Riddiough and Son, Bradford).

Mr. A. G. Beaver initiated a discussion upon methods of investigating the status of retail applicants for trade terms. With a view to making it difficult for all but bona fide traders to obtain supplies of radio goods, the Federation has in mind to offer the trade a standard form for this purpose, supplemented by a suggested system of tests and checks.

WIRELESS RETAILERS' ASSOCIATION.

The annual general meeting of the Wireless Retailers' Association was held at St. Bride's Institute. The hon. treasurer, commenting upon the report and accounts for 1928, remarked on the fact that so much had been accomplished with so little funds. It was a matter of disappointment to the Council that so many members allowed their membership to lapse by the non-payment of subscriptions, and he hoped that they would realise the necessity of their continued support. Funds were necessary to the successful functioning of the Association, and to enable it to take its place as a representative body of retailers along with the manufacturing and factoring organisations. He stressed the need of close and effective co-operation between the R.M.A., the R.W.F., and the W.R.A. Until these bodies were all in line, satisfactory trading conditions could not be enforced. Although the formation of local associations deprived the headquarters of the *per capita* grant, he welcomed the extension of the movement as a very gratifying sign, and expressed the belief that efforts in this direction would have greater success in the future.

In proposing that Mr. Horsey be elected Vice-President of the Association, Mr. A. de Villiers remarked that Mr. Horsey had officiated as Chairman of the Association almost from its inception. Mr. Lightfoot seconded the resolution, which was carried unanimously.

Mr. Horsey proposed that Mr. A. de Villiers should be appointed Chairman. The proposal was seconded by Mr. Hammond and carried unanimously. It was proposed by Mr. Lightfoot, seconded by Mr. Wright, and unanimously resolved, that Mr. Botambeau be elected Vice-Chairman.

The Chairman read the names of the retiring members of the Council, and it was unanimously resolved that the following members be re-elected :—Messrs. F. W. Doughty ; J. W. Lightfoot ; C. F. Jacoby ; A. J. Morgan ; C. L. Elliott ; S. R. Wright ; L. S. Davis ; S. G. Beeson ; J. E. Morley ; H. T. Morgan ; E. J. Hammond ; F. Chidsey ; G. C. Kentish ; L. T. Dobbin ; B. J. Turner ; R. C. Gilbert ; W. Moody ; W. Jennings ; and E. W. Burnett.

The following members were unanimously elected additional members of the Council :—Messrs. Shearman Dyer ; A. H. Edridge ; C. F. Thatcher ; A. E. Firmin ; Herbert Smith ; L. H. Collings ; and S. Dagnall.

It was proposed by Mr. de Villiers, seconded by Mr. Davis and unanimously resolved, that Mr. Willard be re-elected hon. treasurer for the current year.

Speaking for his firm upon their re-election as secretaries, Mr. H. M. Clifford said they derived great satisfaction from the steady progress made by the Association in membership, in influence and in prestige. The co-operative action which must, in due course, arise between the three associations representing the manufacturers, wholesalers and retailers respectively, must be of great benefit to all.

The proposed new rules were considered at some length, and motions for several alterations which were suggested were subsequently withdrawn. It was finally proposed by Mr. H. T. Morgan, seconded by Mr. Davis, and unanimously resolved, that the new rules as printed and circulated to the members be and are hereby adopted *en bloc* as the Rules of the Association in substitution for the old rules.

Some discussion followed on general matters during which the secretary of the South Wales W.R.A., Mr. H. T. Morgan, instanced some flagrant cases of price-cutting and the improper allowance of discounts which had recently come under the notice of his Committee, and in concluding he stated that the support received by his organisation from the W.R.A. was a matter of satisfaction to them.

A member expressed the hope that, in course of time, the R.M.A. would only supply the R.W.F., and that both bodies would only supply retailers approved by the W.R.A.

TRADE PUBLICATIONS.

THE April stock list of T. HARDING, CHURTON AND CO., LTD., Atlas Works, Leeds, has been received.

A bridge marker, illustrated with views of the Prescot works, has been sent to us by BRITISH INSULATED CABLES, LTD.

The A.E.G. ELECTRIC CO., LTD., 121, Victoria Street, London, S.W.1, has issued X 1100 E and X 1106 E, dealing with domestic electrical appliances.

L.445, entitled " Lighting in Industry," has been received from THE BRITISH THOMSON-HOUSTON CO., LTD., of Mazda House, Newman Street, London, W.1.

The MIDLAND ELECTRIC MANUFACTURING CO., LTD., Barford Street, Birmingham, has issued a leaflet relating to the " Mem 8 " double-pole switch and fuse unit.

The BRITISH THOMSON-HOUSTON CO., LTD., Rugby, has sent us list No. 1 105–A* which deals with steam turbines of large pressure type. This list cancels D.6 No. 1 105.

The TUNGSTONE ACCUMULATOR CO., LTD., of Salisbury Square, London, E.C.4, has published a special folder devoted to the merits of accumulators bearing the Tungstone trade mark.

SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38–39, Upper Thames Street, London, E.C.4, have sent us leaflet No. 257, dealing with the new reduced prices of " Pearl " and " Silvalux " lamps.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

CARLISLE CORPORATION.—Supply of lead covered, and lead covered and paper insulated, cables, for one year. Specification, etc., from Mr. C. W. Salt, city electrical engineer.

RENFREWSHIRE EDUCATION AUTHORITY, April 19th.—Electrical work in connection with alterations and additions to North Public School, Paisley. Schedules, etc., from Mr. J. H. Pullar, 16, Glasgow Road, Paisley; deposit £1.

CENTRAL ELECTRICITY BOARD, April 22nd.—Supply and erection of 33 000 V and lower voltage transformers. Specification (No. N.W.E.-ST.2) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Government Lamps Contract.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC.—April 22nd.—Supply of incandescent lamps. Forms of tender, etc. from the Controller of Supplies, King Charles Street, Westminster, S.W.1.

EDINBURGH EDUCATION AUTHORITY, April 22nd.—Electric lighting work, in connection with erection of Saughton Mains School. Specifications, etc., from Mr. J. A. Carfrae, 3, Queen Street, Edinburgh.

GLASGOW CORPORATION, April 22nd.—One year's supply of electrical fittings and accessories, etc. Specifications from the Lighting Department, 20, Trongate, Glasgow.

NEWMILNS AND GREENHOLM CORPORATION, April 22nd.—Electric lighting work in 17 houses. Particulars from the surveyor, Mr. James H. Gilmour.

GLASGOW CORPORATION, April 23rd.—Twelve months' supply of various stores and materials to the tramways department. Specifications, etc., from the General Manager, 46, Bath Street, Glasgow.

DUNDEE CORPORATION, April 24th.—One year's supply of stores to transport department, including armature and field coils, carbon brushes, etc. Specifications from Mr. D. P. Morrison, Transport Office, Dundee.

HOLBORN (LONDON) GUARDIANS, April 24th.—Supply of electrical fittings, for one year. Forms of tender from the Clerk, 53, Clerkenwell Road, E.C.1.

MANCHESTER CORPORATION, April 24th.—Twelve months' supply of dry batteries, adhesive tapes, cable covers and tiles, fuse boxes, junction boxes, insulators, tinned copper wire, etc. Forms of tender, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

NORTHERN IRELAND GOVERNMENT, April 25th.—Installation of electric light, bells and power wiring at Stranmillis Training College, Belfast. Form of tender, etc., from the Ministry of Finance, 15, Donegall Square West, Belfast.

SALFORD CORPORATION, April 26th.—Supply of e.h.t. and l.t., paper insulated, lead covered cable. Particulars from the City Electrical Engineer.

DUNDEE HARBOUR TRUSTEES, April 27th.—Supply and erection of two 3-ton, electric, travelling jib, portal cranes at King George V. Wharf, Dundee Harbour. Specifications, etc., from the General Manager and Engineer, Harbour Chambers, Dundee.

CENTRAL ELECTRICITY BOARD, April 29th.—Supply and erection of electricity meters, in connection with the Central Scotland Electricity Scheme. Specification (No. C.S.-S.S.14) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

MANCHESTER CORPORATION, April 30th.—Supply and erection of one 33 000 V, 11 500 kVA, self-cooled, outdoor auto-transformer (specification No. 250) and one 6 600 V switch, etc., and a neutral earthing resistance (specification No. 251). Specifications from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each.

SOUTHAMPTON CORPORATION, April 30th.—(1) Steel framed building, platform for fans, overhead bunkers, etc.; (2) two water tube boilers with superheaters, economisers, stokers, fans, soot blowers, etc.; (3) steam, feed water and other piping, etc.; and (4) water softener, at Electricity Works, Western Esplanade, Southampton. Specification, etc., from Mr. W. G. Turner, borough electrical engineer; deposit £2 2s.

STAFFORDSHIRE EDUCATION COMMITTEE, April 30th.—Electric light installation in the Girls' High School, Stafford. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s.

STAFFORDSHIRE EDUCATION COMMITTEE, April 30th.—Electric light and power installation in new High School for Girls, Wellington Road, Bilston. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

DEVIZES RURAL DISTRICT COUNCIL, May 1st.—Electric light installation in houses at Market Lavington, Potterne, and Rowde. Particulars from the clerk, Mr. P. R. Trapp, Maryport Chambers, Devizes.

HEYWOOD CHAPEL, NORTHOWRAM, May 1st.—Electrical installation in chapel, school, manse and caretaker's house. Tenders to Mr. F. Rushworth, 24, Back Clough, Northowram.

EPPING GUARDIANS, May 2nd.—Electric light installation at the Institution. Specification, etc., from the Clerk, High Street, Epping.

WALTHAMSTOW EDUCATION COMMITTEE, May 3rd.—Electrical installation in Billet Road School, Walthamstow. Specification, etc., from Mr. G. R. Spurr, Electricity Works, Exeter Road, Walthamstow, London, E.17; deposit £1.

CENTRAL ELECTRICITY BOARD, May 4th.—Supply and erection of 33 000 V and lower voltage cables, under the South-East England electricity scheme. Specification (No. S.E.E.-G.C.1) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EDINBURGH EDUCATION AUTHORITY, May 6th.—Electric lighting installation in Gorgie New Special School and Annexe to Trinity Academy, Bangholm Recreation ground. Schedules etc., from the Education Offices, Castle Terrace, Edinburgh.

ISLINGTON (LONDON) BOROUGH COUNCIL, May 6th.—Supply and installation of two lead batteries for Edison refuse collecting vehicles, having carrying capacity of 3½ to 4 tons, Further particulars from the Cleansing Superintendent, Liverpool Road, N.1.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(a) Main 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 1 500 000 kVA; (b) auxiliary 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 500 000 kVA, with group feeder reactors, for Ironbridge power station. Specification (No. 4) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(1) One 50 000 kW turbo-alternator, with step-up transformers, etc.; (2) condensing plant, boiler-feed pumps, evaporators, etc.; (3) circulating water pumps, etc., for Ironbridge power station. Specifications (No. 2) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

LOURENCO MARQUES PORT AND RAILWAYS BOARD, April 22nd.—Supply of electric hanging and ordinary lamps. (Reference B.X. 5 188.)

DUBLIN PORT AND DOCKS BOARD, April 23rd.—Supply and erection of three electric, overhead, travelling cranes and gantries, at new tobacco warehouse, Custom House Docks, Dublin. Specification, etc., from the Engineer, East Wall, Dublin.

PORT ELIZABETH MUNICIPALITY, April 25th.—Supply and erection of 22 000 V switchgear, h.t. and l.t. switchboards (specification No. 20). (Reference B.X. 5 194.)

PORT ELIZABETH MUNICIPALITY, April 25th.—Supply of 200 kVA transformer, earth resistance and various lamps (specification No. 22). (Reference B X. 5 195.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, April 25th.—Supply of three electrically-driven wheel lathes (tender No. 1 410). (Reference A.X. 7 621.)

Digitized by Google

JOHANNESBURG MUNICIPALITY, April 27th.—Supply of steel tramway poles (contract No. 154). (Reference A.X. 7 728.)

IRISH FREE STATE ELECTRICITY SUPPLY BOARD, April 29th.—Supply and laying of 40 000 V cables in the county and city of Dublin. Specification, etc., from Mr. P. J. Dempsey, 60–62, Upper Mount Street, Dublin; deposit £5.

VICTORIAN ELECTRICITY COMMISSION, April 29th—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills, with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

CAPETOWN MUNICIPALITY, May 1st.—Supply of 30 ft. steel poles, cross arms, insulators, fly fuses, etc. (specification 459/1929). (Reference A.X. 7 697.)

LOURENÇO MARQUES PORT AND RAILWAYS BOARD, May 6th.—Supply of electric motors, turntables, drilling machine, etc. (Reference A.X. 7 765.)

STATE ELECTRICITY WORKS, MONTEVIDEO, May 6th.—Supply of electric cables and accessories. (Reference B.X. 5 178.)

BRAY URBAN DISTRICT COUNCIL, May 7th.—Supply and erection of (*a*) steam crane, and (*b*) electric crane, to lift three tons, at Bray Harbour. Further particulars from Mr. E. M. Murphy, 27, Molesworth Street, Dublin.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 7th.—Supply of two electric motor-driven centrifugal pumps. (Reference A.X. 7 738.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, May 13th.—Supply and erection of synchronous condenser (contract 257, 28). (Reference B.X. 5 205.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, May 15th.—Supply and erection at Government Printing Office, Cairo, of 120 kW d.c. Diesel electric generating set, with foundations, artesian well, electrically-driven water cooling pump, etc. Forms of tender, etc. (10s. 6d.), from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, May 15th.—Supply of 500 kW sub-station rectifier unit, arranged for automatic control, with necessary switchgear (contract 677). (Reference B.X. 5 206.)

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, May 15th.—Supply of sub-station units for automatic control, comprising two rotary converters of 1 000 kW and one of 500 kW (contract No. 678). (Reference B.X. 5 210.)

VICTORIAN RAILWAY COMMISSION, May 15th.—Supply of one geared, three-phase, electric winding engine (contract No. C.M. 778). (Reference A.X. 760.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, May 16th.—Supply and installation of electric signalling apparatus at Johannesburg. (Reference B.X. 5 165.)

BLOEMFONTEIN MUNICIPALITY, May 18th.—Supply and erection of (*a*) turbine and generator, condensing plant and auxiliaries and switchgear and cables; (*b*) cooling spray pond equipment, or cooling tower (contract No. 1). Reference B.X. 5 192.)

PLOVDIFF (BULGARIA) PROVINCIAL COUNCIL, May 20th.—Supply of two Francis turbines, two 5 000 kVA generators, two 5 000 kVA, two 1 000 kVA and two 150 kVA transformers, for Votscha-Kricim power station.

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 23rd.—Supply of rubber covered wire and telephone cable (contract No. 153.) (Reference B.X. 5 229.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 28th.—Supply of telephone jacks and number plates (schedule C.417). (Reference B.X. 5 202.)

Telegraph Materials for South Africa.

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 30th.—Supply of telegraph materials, tubular arms, crossheads, bases, stay plates, etc. (tender No. 152). (Reference A.X. 7 767.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 4th.—Supply of 18 electrically operated water level indicators (contract No. 61/1928–29 W.S. and S.). (Reference B.X. 5 233).

VICTORIAN ELECTRICITY COMMISSION, June 4th.—Supply of 22 000 V transformers and spares (specification No. 29/36). (Reference B.X. 5 216.)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, June 18th.—Supply of switchboard cable (contract C. 427). (Reference B.X. 5 228.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 22nd.—Supply and erection of transformers, with certain spares, for Burrinjuck hydro-electric development (contract No. 29/29). (Reference B.X. 5 230.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of protected type, telephone cable terminal boxes (schedule C.430). (Reference B.X. 5 231.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X. 7 735.)

Tenders Accepted.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., distribution boards.

WATFORD CORPORATION.—W. T. Henley's Telegraph Works Co., Ltd., supply of cable.

CANTERBURY GUARDIANS.—J. Elvidge, electrician's work at the Institution for six months.

CHESTER GUARDIANS.—F. J. Jones and Son, supply of electrical goods for three months.

BURTON-ON-TRENT CORPORATION.—Arthur Talbot, electric organ blower at town hall, £96 4s.

HENLEY-ON-THAMES CORPORATION.—Thames Valley Electricity Supply Co., street lighting for five years.

WATFORD CORPORATION.—J. W. Russell, house wiring, at schedule prices, for 12 months. (Recommended.)

BELFAST CORPORATION.—Siemens Electric Lamps and Supplies, Ltd., one year's supply of electric lamps.

GLASGOW CORPORATION.—English Electric Co., Ltd., ten 50-period a.c. motors, £545; Thos. Bolton and Son, Ltd., trolley wire.

EDINBURGH CORPORATION.—Carron Company, supply and erection of traffic lamps at various points in the city, £400. (Estimated.)

HOLBEACH URBAN DISTRICT COUNCIL.—Boston and District Electric Supply Co., Ltd. public lighting, with 76 standards, £263 2s. 6d. per annum.

CAMBRIDGE GUARDIANS.—Siemens-Schuckert (Great Britain), Ltd., installation of automatic telephones, £178, with two years' free maintenance.

BASINGSTOKE CORPORATION.—Hackbridge Cable Co., Ltd., supply of cables, £1 339; Taunton Brick and Tile Works, supply of conduits, 2s. 3d. per yard.

HULL CORPORATION.—Bruce Peebles and Co., Ltd., supply of three 1 500 kW motor converters, £13 115 5s.; Drysdale and Co., Ltd., circulating water pump, £3 363.

YORK CORPORATION.—Barber and Colman, installation of automatic signals at Spurriergate, Gillygate, King's Square, Lawrence Street and Rougier Street, £523 19s. 9d.

GRAVESEND CORPORATION.—Dictograph Telephones, Ltd., installation of internal telephones at electricity offices, £94; W. T. Henley's Telegraph Works Co., Ltd., overhead mains along canal, £1 273 4s. 4d.

CAPE TOWN CORPORATION.—Switchgear and Cowans, Ltd., supply of 24 1 000 A double-bladed, quick break knife switches, £310 7s. 6d.; S.A. General Electric Co., Ltd., supply of motor and starting equipment, at Walmer brickworks, £285. (Both recommended.)

PLYMOUTH CORPORATION.—A. Reyrolle and Co., Ltd., switchgear; British Insulated Cables Ltd., and Metropolitan Electric Cable and Construction Co., Ltd., cables; Ferranti, Ltd., a.c. and d.c. meters; British Electric Transformer Co., Ltd., transformers. (All recommended.)

CENTRAL ARGENTINE RAILWAY. — Metropolitan-Vickers Electrical Co., Ltd., supply of 20 000 V transformers and switchgear of large capacity, for extensions to power station, complete equipment for five new sub-stations, extension equipment for four existing sub-stations, and electrical equipment for 145 coaches, in connection with the extension of the electrification of the Buenos Ayres suburban lines.

BRADFORD CORPORATION.—Indented Bar and Concrete Engineering Co., Ltd., supply of reinforced steelwork for new cooling pond; Mather and Platt, Ltd., supply of two feed pumps; J. Blakeborough and Sons, Ltd., supply of circulating water valves and atmospheric exhaust valve, for a turbo-alternator, and steam valves for a boiler and high pressure plant, at Valley Road power station.

BUSINESS ITEMS.

THE address of the registered office of the NORTHERN ELECTRIC WIRE CO. is now Mill Brow, Blackley, Manchester.

The GREENWICH CABLE WORKS, LTD., has removed to Mitcham Road, Croydon. Telephone : Thornton Heath 2882

The offices and stores of the STERLING VARNISH CO. have been transferred to Fraser Road, Trafford Park, Manchester.

A PHOTOGRAPH illustrating the simplified range of glareless lamps which has been adopted by members of the E.L.M.A., showing in front the lamps replaced. This stand is being employed this week by Mr. W. J. Jones and Mr. H. E. Hughes in the glareless lamp lectures, of which details were published in our last issue.

The FOSTER ENGINEERING CO., LTD., Morden Works, Wimbledon, London, S.W.19, has opened a new London service depot at 11, Fitzroy Square, W.1.

PRITCHETT AND GOLD AND E.P.S. CO., LTD., with whom are incorporated Messrs. Peto and Radford, inform us that their Glasgow depot has moved to 45, Clyde Place, Glasgow.

The D.P. BATTERY CO., LTD., Bakewell, Derbyshire, has received orders through the English Electric Co., Ltd., for seven batteries in connection with the South East England Electricity Scheme.

One of the largest storage batteries in use in Australia at the present time for telephone exchange work has just been put into commission at Brisbane Automatic Exchange. The battery was supplied by the D.P. BATTERY CO., LTD., of Bakewell, Derbyshire—Australian Agents, T. K. Steanes and Son, Sydney.

The Italian Broadcasting Co. has authorised the MARCONI'S WIRELESS TELEGRAPH CO., LTD., to proceed with the manufacture of a short wave broadcasting transmitter for Italy. The station will to a large extent follow the design of 5SW, and will enable the Italian Broadcasting Co. to carry on a broadcasting service for the Italian Colonies.

FERGUSON, PAILIN, LTD., announce that Mr. J. Reed Wilkinson has been appointed chief sales engineer and manager of the company's London office, situated at Bush House, London, W.C.2, in succession to the late Mr. Frank Thorp. Mr. Wilkinson has had many years' experience in the various departments of the company's head office, and for the last three years has been chief of the sales and estimating departments.

A notable long distance record has just been achieved on the Montlhéry track, Paris, by a 348 c.c. Dunelt Majestic motor cycle, selected by the A.C.U. from a stock of similar machines (each fitted with a B.T.H. magneto) at the manufacturer's works. The machine was driven day and night under A.C.U. observation for between 23 and 24 days, a distance of 25 000 miles being covered. During the run the magneto made over fifty million sparks.

The Swedish Government has placed an order with the MARCONI'S WIRELESS TELEGRAPH CO., LTD., of Marconi House, Strand, London, W.C., for the supply of a 60 kW, aerial energy, transmitter for installation at Stockholm. This contract was obtained by the Marconi company in the face of keen competition, and is a tribute to the design and performance of British broadcasting transmitters which have now been installed in over 20 countries outside Great Britain. The new Swedish broadcasting station will be operated on the low-power modulation system, with deep and distortionless modulation ; and will be worked direct off a three-phase power supply.

ELECTRICITY SUPPLY.

SHIPLEY Electricity Committee has obtained a site in Clarence Road for a sub-station.

Brierfield U.D.C. has received sanction to borrow £10 000 for an electricity conversion scheme.

Colchester T.C. has applied for a loan of £50 000 in connection with an extended area of supply.

Bromley (Kent) T.C. has applied for a loan of £15 000 for general mains and services for the ensuing two years.

Chichester Corporation has applied for a loan of £1 657 in connection with a supply in bulk to Bognor.

The Dalmarnock (Glasgow) generating station will be operated for the Central Electricity Board on and after May 1st.

Driffield R.D.C. has decided to offer no objection to the scheme of the Holderness Trust, Ltd., to supply the whole of the Buckrose area.

Application for a Special Order to extend the area of supply so as to include Warburton, Agden, and High Legh has been made by Warrington T.C.

Leeds Electricity Committee has obtained sanction to borrow £400 000 for mains, £50 000 for sub-station equipment, and £50 000 for assisted wiring.

Runcorn R.D.C. has received notice from the Mersey Power Co. of its intention to extend the supply to Halton by means of overhead cables.

Eastbourne Electricity Committee is to erect 27 new lamps, with Paisley fittings and rings, for decorative lamps on the sea wall of the Royal Parade, and to lay cables at a cost of £1 949.

Pocklington (Yorks) U.D.C. recently decided not to oppose the application of the Holderness Trust, Ltd., for an Order to supply in a district including the Council's area.

The Somerset Drainage Commissioners have given permission to the Bridgwater Electric Light Co. to cut the embankment of the river Parrett in order to lay armoured h.t. cables.

Fulham (London) Electricity Committee proposes to lay new cables in Biscay Road, Claxton Grove, Garvin Road, Glencross Street, and Margravine Gardens, at an estimated cost of £715.

The terms of Luton T.C. for public lighting by electricity by 13 100 W lamps for a minimum period of 10 years, from September 1st to April 15th in each year, at £62 1s. 6d. per annum, have been accepted by Heath P.C.

Luton T.C. has applied for a loan of £153 267 for extensions of the power station, including a 12 500 kW turbo alternator, with condensing plant, etc., 6 600 V switch panel, with cables, etc., two boilers, evaporator, pipework, feed pumps, etc.

Swansea Electricity Committee is to extend mains to subsidy houses on the Birchgrove housing estate.—The Birchgrove Structural Co., Ltd., has asked Swansea Electricity Committee for a supply in bulk, and a supply is to be given, at an estimated cost of £1 000.

Weymouth Electricity Committee has entered into an agreement with the Weymouth Bay Estate as to a supply to Overcombe.—The Committee has obtained sanction to borrow £1 355 in respect of the Upway, Wyke Regis and Two-Mile Coppice sub-station buildings and sites.

Additional cables in the Shepherd Street area are to be laid by Hastings Electricity Committee at a cost of £460 and in Pevensey Road at a cost of £220.—The Committee has obtained sanction for a loan of £1 000 for mains and sub-station equipment for supplying Peasemarsh.

The ratepayers of the Shanghai International Settlement agreed on Wednesday to accept the offer of the American and Foreign Power Co. of £10 000 000 for the Shanghai electricity undertaking. Associated in the transaction is a British group, including Mr. F. Dudley Docker, Sir H. C. Holden, Lazard Bros. and Co., Whitehall Electric Investments, Ltd., and the Whitehall Trust Ltd.

The Central Electricity Board has decided that the question whether the Sculcoates (Hull) station should be retained as a three-shift station or not shall be left open to be decided when the Mid-East England scheme comes into operation. The Board recognises the importance of Hull, and, as a port, ought not to be too dependent upon long transmission lines.

The Central Electricity Board has intimated that Chesterfield may either remain a selected station under the Mid-East England Scheme, and bear the whole of the expense of the transmission line from Walton to Chesterfield, or become a de-selected or " temporary arrangement " station, and continue to take its supply from the Derbyshire and Nottinghamshire Electric Power Co. The Corporation has chosen the latter course.

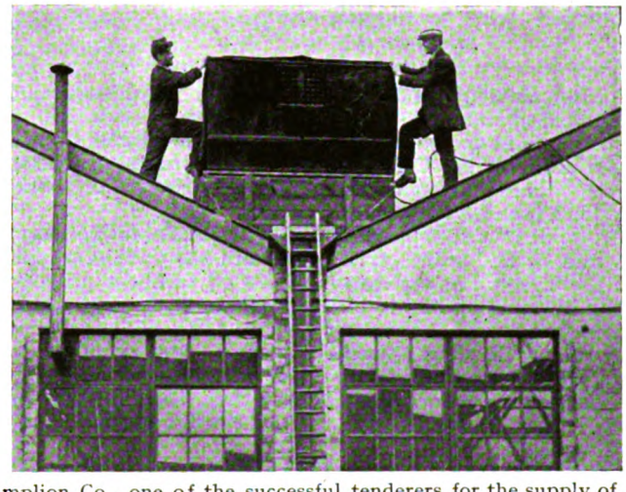
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mr. A. E. Angold, whose death last week is referred to on page 479, was one of the early designers of electric arc lamps, and did considerable work throughout the war in designing searchlight arcs for the Services.

Since the coming of the " talking " picture, a new branch of the manufacturing side of sound reproducing apparatus has been developed, and in this picture of the Hawthorne Works of the Western Electric Co. may be seen a number of cinema amplifiers being assembled. Each edition of a talking film requires its own particular sound reproducing equipment, for, at the present time, the necessary apparatus is included in the hiring agreement of the film.



These photographs taken at the Slough works of the Graham Amplion Co., one of the successful tenderers for the supply of totalisators for the Racecourse Betting Control Board, show, left, the indicator in course of construction, and right, the electric recorder which will convey by means of lamps the necessary information to the betting public. The first " tote " is to be installed at Hurst Park, some time in August, and that part of the order secured by Graham Amplion, Ltd., is valued at £100 000.

The annual dinner of the staffs of Messrs. W. T. Henley's Telegraph Works Co., Ltd., and Henley's Tyre and Rubber Co., Ltd., was held at the Great Central Hotel, London, on April 13th, the guests numbering over 500. A concert and dance followed the dinner, a number of musical and variety artistes contributing to the evening's enjoyment. A brief report of the proceedings and speeches is given on page 486, while a photograph of some of the diners is shown above.

Digitized by Google

THE SOCIAL SIDE.

THE annual dinner of the staffs of Messrs. W. T. Henley's Telegraph Works Co., Ltd., and Henley's Tyre and Rubber Co., Ltd., took place on April 13th at the Great Central Hotel, Marylebone, London. In addition to an excellent dinner,

THE illumination of St. Martin's-in-the-Fields, London, has been re-designed by Maxwell, Butcher and Co., Ltd., introducing a number of specially designed G.E.C. church lighting units, some of which may be seen in this photograph of the nave.

the entertainment included performances by a number of accomplished musical and variety artistes, with Mr. E. Shakespeare at the piano, and dancing in the Winter Gardens to the music of the Cabaret Band, conducted by Mr. Albert Kersey. Those present, numbering 500, voted the whole function a pronounced success.

Mr. W. G. Smale proposed the toast of "The Cable Company," and said he had seen service with both the Cable Company and the Tyre Company amounting in all to about 30 years, failing by nine months to qualify for one of the long-service awards.

Mr. Percy Rosling (general manager), who occupied the chair, dealt with the history of the Cable Co. He joined the company 42 years ago. The staff then was under a dozen. To-day they were somewhere in the neighbourhood of a thousand.

Sir George Sutton said he had not been well, and only decided at lunch time that day to attend the dinner. He came because he looked upon it as a unique meeting of the Henley Company. It was the first meeting of the kind at which the ladies and gentlemen employed by the company had sat down to dinner together.

Mr. W. F. Bishop proposed the toast of the Tyre Co., and Mr. J. Traxler, who responded, said 1928 had been a record year and they believed 1929 would eclipse 1928. Sir George was wrong in saying that was the first gathering at which ladies had been present. The Tyre Co. set the precedent.

Sir Montague Hughman proposed and Mr. P. Dunsheath acknowledged the toast of "The Ladies."

Mr. Ernest Lefeaux, in the absence of Mr. H. Savage, proposed the toast of "The Chairman," See page 485.

The St. Helens Cable Co. football team won the Slough Town Cup and is also the probable champion team of the Slough Junior League.

THE DIESEL-ELECTRIC OIL TANKER, "BRUNSWICK."

A recent inspection of the Diesel-electric oil tanker, "Brunswick," at Thameshaven, has revealed that the electrical machinery is in as good a condition to-day as when it was installed. The vessel is owned by the Atlantic Refining Co. of Philadelphia, and during the last seven months has covered 48 000 miles, trading between California and South Africa, Australia and New Zealand. Messrs. Scotts' Shipbuilding and Engineering Co., Ltd., Greenock, were the builders, and the British Thomson-Houston Co., Ltd., Rugby, the manufacturers of the electrical propulsion equipment, and auxiliary motors and control gear for all services.

S.E. ENGLAND SWITCHGEAR.

Details of "Indoor-Outdoor" Equipment for Inner London Network.

THE 66 000 V switchgear recently ordered from the British Thomson-Houston Co., Ltd., by the Central Electricity Board for the South East England Electricity Scheme is required in connection with the inner London network. This switchgear is of the "indoor-outdoor" type, and each oil-immersed circuit breaker is rated at 600 A, with a rupturing capacity of 1 500 000 kVA at 66 000 V.

The buildings housing the switchgear have three floors, the two upper being glazed, and provided with access facilities at each end, the lower being unenclosed, but having a retaining wall from end to end. The circuit breakers are located on either side of this wall, the busbars and busbar isolating switches being in the two enclosed floors above.

All busbars are in duplicate on each side, one set being enclosed on the first floor and the other set on the second. Oil-filled bushings of special construction are used where the connections pass through the floor of the top chamber, these bushings also taking the clip contacts of the busbar isolating switches for the first-floor busbars. In most instances copper tube is used for the connections, and all isolating switches are remote operated from ground level, a comprehensive system of interlocks preventing access both to the busbar and isolating switch chamber unless all associated equipment has been made dead. In addition, the interlocking devices are so designed that maintenance men can check the operation of isolators with safety in switch chambers which have been made dead for this purpose, special sequence interlocks being provided to meet this condition.

The oil circuit breakers are of the multi-break type, each phase being self-contained in a cylindrical tank mounted on a frame structure.

Purification of circuit breaker oil is carried out by equipments provided on each site, without removal of any single unit being necessary, but, by means of motor-operated tank trucks, circuit breaker tanks, and complete single-phase units can be removed for inspection.

Special electrical tubular heaters are also included to ensure that the temperature of the busbar chambers is kept above that of the surrounding atmosphere.

METAL AND CHEMICAL PRICES.

THE LEAD MARKET.

The market rallied slightly last week to £24 18s. 9d. for April and £24 16s. 3d. for July, but according to James Forster and Co., prices later re-acted to £23 17s. 6d. and £23 10s. for the same positions. Later there was a recovery of about 12s. 6d. per ton from the bottom, the tone at the close being steady.

The American price was lowered on April 8th to 7·25 and again on the 11th to 7·15 cents per lb.

Closing prices on April 12th were £24 10s. for April, £24 6s. 3d. for May, £24 3s. 9d. for June, and £24 2s. 6d. for July, unchanged to 7s. 6d. lower on the week.

COMPANY NEWS.

Telegraph Descriptions Variable—Manufacturing Holdings Unsteady—Electricity Supply Shares Decline—Electric Tractions Improve—Company Meetings, Reports and Dividends.

NO outstanding feature is shown this week in our usual tabular comparison of price changes in the electrical share markets, which have remained relatively quiet. Marconi's Wireless Telegraph shares have lost the half-crown gained last week, but Eastern stock is unaffected by deduction of the dividend. General Electrics are up 1s. 3d., and Ever Readies 6d.—a bigger proportionate improvement. English Electric shares have declined from 7s. 6d. to 6s. 10½d. Underground Electric Railways ordinary shares are 6d. higher, and Metropolitan 3½% preference stock is a point up. County of London ordinary shares have eased 6d.

LANCASHIRE ELECTRIC LIGHT AND POWER CO.—Subscriptns. have been invited this week for an issue of 600 000 £1 shs. at 27s. p. sh.

INDO-EUROPEAN TELEGRAPH CO., LTD.—Fin. div. for 1928 4½%, plus bonus 3%, makg. 10%, tax free (same as last year).

WEST LONDON AND PROVINCIAL ELECTRIC AND GENERAL TRUST, LTD.—Fin. div. of 3½%, makg. 10% for year to March 31, agst. same div. and 50% sh. bonus last year. To res., £2 500. Fwd., £5 761, agst. £3 213.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—Fin. div. of 4% actual, makg. 8% for year on "A" ord. shs. and div. of 7½% for year on "B" ord. shs., both subject to deductn. of tax at 4s. in £, are proposed.

BABCOCK AND WILCOX, LTD.—Accts. for 1928 show net blce., after providg. for all charges, of £734 902, agst. £743 820. Pref. div. absorbed £14 952. To res., £150 000, agst. £100 000; pensions fund, £20 000 (same). Ord. div. 15%, tax free. Fwd., £118 363, agst. £125 361.

BRITISH INSULATED CABLES, LTD.—Resolutns. have been passed increasing the cap. by the creatn. of 333 333 £1 ord. and 500 000 £1 "A" 5½% cum. pref. shs., to be allotted among the ord. shhldrs. in the proportn. of one ord. sh. for every four, and three "A" pref. in respect of every eight ord. held.

AMALGAMATION OF TRADE JOURNAL PROPRIETORS.—An amalgamation between the proprietors of "The Engineer," "The Ironmonger" and "The Chemist and Druggist" will take place on May 1. A new co., with the title of Morgan Bros. (Publishers), Ltd., and a cap. of £500 000, will acquire the properties from the present owners, "The Engineer," Ltd., and Morgan Bros. (Publishers), Ltd.

SOUTH WALES ELECTRICAL POWER DISTRIBUTION CO.—Rpt. of the Parliamentary Co. for 1928 states that credit blce., after paymt. of workg. exes. and includg. due maintenance of plant and machinery, was £89 059. Deductg. deb. int., leaves £24 990. To depreciatn. res., £15 000; div. on pref. shs., 5%, leavg. £3 724. The income of the limited co., included int. on investmts., £4 373, div. on pref. shs. of the Distribution Co., £6 255, and blce. of the Distribution Co.'s rev. acct., £3 724. Amt. brt. in from last year, £20 705, makes total of £78 910. Int. and sinkg. fund on 6% 1st mtge, deb. stk., £39 890; div. of 6½% on cum. pref. shs., £16 250, and directors', trustees', and auditors' fees, £1 587. Fwd., £21 182.

THE CABLES AND WIRELESS MERGER.—A statemt. has been issued by Cables and Wireless, Ltd., and the Imperial and International Communications, Ltd., in regard to inter-relation of the Imperial and International Communications Co., the Cables and Wireless Co., the old Cable Companies and the Marconi Co. Cables and Wireless, Ltd., will hold all, or nearly all, the shs. in the old cable cos. and the Marconi Co. All the communication assets held by the Cable and Marconi Cos. will be transferred to the Communications Co. in exchange for shs. in that co. Although the pref. shs. of the Eastern Co. and the deb. stk. of all three cable cos. will continue to be held directly by the public, both the old cable cos. and the Marconi Co. will, in fact, have little more than formal existence under the new régime. The Cables and Wireless Co., the head of which is Mr. Denison-Pender, will conduct all the non-communications business of the old cable companies and Marconi Co., particularly the mfg. business of the Marconi Co. For the conduct of this business, it is intended that a Management Committee shall be appointed consistg. of Mr. Denison-Pender, Sir Basil Blackett, Mr. Kellaway and Lord Inverforth. The chairman of the Communications Co. is Sir Basil Blackett, and the conduct of the Communications Co. will be in his hands and in those of the managing directors: Mr. Denison-Pender and Mr. Kellaway. The membership of the boards of all the cos. will be identical, but there will be a diffrntiatn. in the offices they hold in the different cos. The diffrntiatn. is important because of the necessity for drawing a clear distinction between the communicatns. business of the coy., in which the Govt. is interested through the Advisory Committee representg. the Govts. of the British Empire, and the non-communicatns. business of the coy., with which the committee is not concerned.

MARCONI SHAREHOLDERS AND THE MERGER SCHEME.—The Protection Committee of £1 ord. and £1 pref. shholdrs. of Marconi's Wireless Telegraph Co., Ltd., issued a statemt. last week setting out Commte's. view of the positn. of the co's. sh. and stk. holdrs. It is stated that under the articles of assn. the rights of a £1 ord. sh. and (for all practical purposes) of a pref. sh. are double those of a 10s. sh. If, therefore, the normal method had been adopted of sellg. the assets of the Marconi Co. for shs. in the merger co., and distributg. these shs. in a windg.-up among Marconi shhldrs. accordg. to legal rights, each £1 ord. and each £1 pref. sh. wld. have been entitled to twice as many shs. of the merger co. as each 10s. ord. sh., whereas under the present offer the hldr. of a £1 sh. is only offered what amts. to a cap. sum of 10s. more than a hldr. of a 10s. sh. Ref. is also made to a proposed arrangemt. under which non-assentg. £1 ord. and pref. shholdrs. wd. deposit their shs. under a trust agreemt. with the Prudential Assurance Co., Ltd., and such shs. shd. be, in effect, split into four shs. each wh. wd. ensure a free market. A mtg. of £1 ord. and pref. shhldrs. has taken place, this week, but no information as to the result was available when we went to press. A committee formed on Tuesday representg. a number of hldrs. of 10s. shs. of Marconi's Wireless Telegraph Co. In a circular which is being sent to shhldrs,, it is stated that it has been felt desirable to form such a committee in view of the attitude adopted by the £1 shhldrs., who complain agst. the terms whereby they are to receive shs. to the nom. value of £4 17s. in the merger co., compared with £4 7s. to be received by the hdrs. of the 10s. shs. It is felt that the attitude of the £1 shhldrs. is unjustified, havg. regard to the fact that but for the sacrifice of cap. and div. made by the 10s. shhldrs. the £1 shhldrs. would have a practically worthless security to-day.

Company Meetings.

PINCHIN, JOHNSON AND CO., LTD.—At an extraordinary mtg. on April 10, a resolution that the 1 500 000 £1 ordinary shares be sub-divided into 3 000 000 10s. ordinary shares was carried unanimously.

PARKER, WINDER AND ACHURCH, LTD.—Sir William H. Bowater, presidg. at the mtg. on April 10, sd. the decline in the amt. of net profit was not due to any fallg. off in the volume of sales, but, in a measure, to lowerg. of values, wh. made sellg. prices bear a lesser gross pft. The directors recommended a div. of 7½%, wh. was only 2½% less than in the preceding year, £8 000 was being carried forwd., and the res. remained at £40 000.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Lt.-Col. Sir Frederick Hall, M.P., presiding at the meeting on Tuesday, in the absence of Sir Harry Renwick, said the total receipts for the past year were £258 367, against £241 450 for 1927. An amount of £15 000 had been set aside as reserve for taxation, preference dividend for the year absorbed £1 800, and they recommended a final dividend of 5½% on the ordinary shares, making 8½% for the year, which was practically the company's standard dividend. The amount carried forward was £95 397. There was an increase of 2 479 847 kWh sold and a substantial increase in the kilowatts applied for. The report and accounts were adopted, and the dividends recommended were approved.

GRAMOPHONE CO., LTD.—At an extraordy. mtg. on April 10, the shhldrs. apprvd. resoltns. increasg. the cap. to £1 720 000 and the max. number of directors to 15. The chn., Mr. E. Trevor Williams, sd. the proposed incr. of cap. by 20 000 £1 ord. shs. was to enable the co. to satisfy a portion of the purchase consideratn. payable to Marconi's Wireless Telegraph Co. under an agreemt. dated March 8 last. With regard to the second resolutn., with the recent additn. of Senatore Marconi and Mr. David Sarnoff, of the Radio Corporation, their complement of directors was full, and they wanted to be in a posn. to meet any further possible contingencies wh. might entail the election of other directors. The board had decided to pay an interim div. on the ord. shs. at the rate of 10% on May 19.

LONDON ELECTRIC WIRE CO. AND SMITHS, LTD.—Sir George H. Fisher-Smith, presidg. at the mtg. on April 11, said the profit and loss acct. showed an increase of £4 662 compared with 1927, which, with the additional £10 000 added to the general reserve acct., made the total increase £14 662. A considerable amt. of business had to be taken at very cut prices, and this increase in profit did not altogether express the improvemt. in the business of the company over that of the previous year. In recent years competition in their business had been exceptionally keen, but their compy. had bn. able to maintain its position in the trade, and he believed the full effects of the special efforts they had made wd. become apparent within the next few years. They had pleasure in recommending that the same final ordinary dividend as last year be paid, making 7½% for the year, leaving to be carried forwd. £22 760.

CHELSEA ELECTRICITY SUPPLY CO., LTD.—Mr. W. R. Davies, presiding at the meeting on April 11th, said the net profit for 1928 was £82 226, including £27 317 brought in from 1927. The balance to be carried forward, after paying the statutory dividend and providing the statutory sinking fund was £24 038. That was about £3 000 less than the amount brought in, but that was due to the proposal to transfer to the employees' pension fund the sum of £16 220, and if that were taken into account it would be seen that they had earned a surplus on the year of about £13 000, after paying the statutory dividends. He hoped that, unless something unexpected should happen, they would, by the end of this year, be able to announce a reduction of their prices for lighting from 5½d. to 4½d., and for power from 1½d. to 1d. The report was adopted and divs. of 6% on the pref. shs. and 8⅞% on the ord. shs. for the year 1928 were approved.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—Sir Bernard E. Greenwell, presiding at the meeting on Tuesday in the unavoidable absence of Sir Harry Renwick, read a speech prepared by the latter, in which he said he was in a position to record another year of continued prosperity. There was an increase of 75 151 048 kW sold, making a total of 323 462 367 for the year, and an increase of 40 449 kW in the new business secured, making a total of 287 390 kW connected. Gross revenue was £1 859 159, increase £144 810, and net revenue showed an increase of £193 103. The sum placed to reserve accounts out of revenue was £346 000, and it was proposed to pay 10% for the year on the ordinary shares, an increase of 2½%. For the three months of this year ended March 31st, there was an increase of 15% in their sales of electricity. The report and accounts were adopted, and a resolution to increase the capital was passed.

BROMPTON AND KENSINGTON ELECTRICITY SUPPLY CO., LTD.—At the meeting on April 11th, Mr. H. R. Beeton, chairman, said the past year, although the third since their company came under the operation of the Act of 1925, was the first in which they were able to derive any advantage from it. It was not until October 15th that they took the whole of their supply from the London Power Co. and closed down their own generating station. They sold 14% more current and earned upwards of 33% more profit, which enabled consumers to enjoy 80% more benefit than in the previous year, and, after providing for sinking funds and contingencies, they had been able to carry more than £3 500 to a reserve account by way of additional dividend for the year, and to add considerably to the amount they were allowed to carry forward. The saving last year on the aggregate supply to the constituent companies, and through them to the public, amounted to £450,000, and he was confident that the benefits attending this great measure of consolidation would grow steadily in the future.

New Companies.

NIGERIAN ELECTRICITY SUPPLY CORPORATION, LTD.—Cap., £200 000. To produce, generate and distribute electrical energy, to carry on business of electricians, electrical or general engineers and contractors, manufacturers of and dealers in electrical apparatus, etc. Reg. Office: Finsbury Pavement House, London, E.C.2 (Public co.)

RURAL-VOLTS, LTD.—Cap., £10 000. To instal apparatus for distribution of energy across country or in any town, village, residence or place within the U.K., to deal in wireless apparatus, to carry out research connected with the adaptation of electricity to agriculture, horticulture, farming, etc. Solicitors: W. H. Smith and Son, Gresham House, Old Broad Street, London, E.C.

KOLSTER-BRANDES, LTD. Cap., £1 300 000. Manufacturers of or dealers in any equipment, apparatus or device used in connection with any process of transmitting, receiving, producing, recording or reproducing by electrical or any other means any matter, whether consisting of sounds, images, signals, impulses or otherwise, etc. Reg. office: Cray Works, Sidcup, Kent. (Public Co.)

BERRY'S INSULATING AND BUILDING PRODUCTS, LTD.—Cap., £175 000. To acquire from A. F. Berry all share capital of Berrite, Ltd. To carry on business of electrical engineers, manufacturers of and dealers in cables, insulators, wires, lines, lamps, refrigerators, ovens, and all apparatus used in connection with electricity, etc. Solicitors: Clifford-Turner, Hopton and Lawrence, 81-7, Gresham Street, London, E.C.2. (Public co.)

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BENN, Mr. L., 72, St. Anne's Road, Southend, wireless merchant. £27 13s. 8d. February 25th.

BIBBY, Hugh, Holly Cottage, Liverpool Road, Longton, electrical dealer. £61 11s. 6d. February 27th.

HAMBLING CLAPP AND CO., 21, Garrick Street, W.C., wireless merchants. £19 8s. 6d. February 15th.

POWELL, Mr. H. B., 10, Union Street, Hereford, wireless dealer. £14 10s. 4d. February 6th.

PRIME, Mr. F. W., 110B, Wandsworth Road, S.W., radio engineer. £23 1s. 11d. February 15th.

ROCHDALE MAGNETO SERVICE, 20, Oldham Street, Rochdale, magneto manufacturers. £16 2s. 9d. February 27th.

SHILVOCK, G., AND SON, 197, Station Road, Rugby, electricians. £18 19s. 11d. February 28th.

SPOONER, Thomas, 72, Adelaide Street, Shildon, wireless dealer. £28 6s. 8d. February 26th.

Bill of Sale.

SHEPHARD, Charles, 69 and 83, Sydenham Road, Sydenham, electrical engineer. Dated March 28th, filed April 3rd. £50.

Deeds of Arrangement.

COCHRAN, Samuel King Young, trading as POPULAR WIRELESS STORES, 26, Moorfields, and 3, Byrom Street, Liverpool, wireless dealer. Dated April 8th, filed April 13th. Trustee, P. S. Booth, 2, Bixteth Street, Liverpool, accountant. Liabilities unsecured £1 267; assets, less secured claims, £530.

GILL, Harry John, 33 and 10, Carne Street, Pentre, electrical and wireless contractor. Dated April 6th, filed April 12th. Trustee, S. E. Clutterbuck, 31, Queen Street, Cardiff, I.A. Secured creditors, £54; liabilities unsecured, £291; assets, less secured claims, £78.

Receiverships.

BOWER ELECTRIC (1926), LTD.—P. J. Chaplin, C.A., of 8, Staple Inn, W.C., was appointed receiver and manager on March 27th, 1929, under powers contained in debentures dated September 15th, 1926.

HODGETTS (S. and F.), LTD. E. A. Clive, of 156, Edmund Street, Birmingham, was appointed receiver and manager on March 19th, 1929, under powers contained in first debenture dated June 27th, 1927.

MICO, LTD.—A. F. Hawdon, of 25, Sanderson Road, Newcastle-upon-Tyne, was appointed receiver and manager on March 28th, 1929, under powers contained in debenture dated March 28th, 1924.

NORFOLK ENGINEERING CO., LTD. F. Heywood, of 16, Cambridge Street, Sheffield, was appointed receiver and manager on March 30th, 1929, under powers contained in mortgage debentures dated July 12th, 1919, and October 25th, 1920.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

BARNETT (C.), LTD., London, W.C., wireless accessory dealers.—Registered March 18th, £250 2nd debenture, to F. T. Smith, 52, Bedford Square, W.C., C.A.; general charge (subject to prior charge).

CLEARTRON (1927), LTD., Birmingham, wireless manufacturers.—Registered April 3rd, series of £10 000 debentures, present issue £2 500; general charge. *Nil. July 24th, 1928.

MARSH (BASIL), LTD., Brighton, manufacturers of wireless apparatus.—Registered April 6th, £700 debentures; general charge.

NELSON BROTHERS, LTD., Blackpool, electricians.—Registered April 3rd, charge, to Bank; charged on 2, Regent Road, Blackpool.

STRATFORD AUTO AND WIRELESS CO., LTD.—Registered March 27th, £315 debenture, to Bank; general charge. *Nil October 3rd, 1928.

WEST SUSSEX ELECTRICAL CO., LTD.—Registered April 6th, £200 debentures, part of £1 000; general charge. *£600. December 31st, 1928.

Satisfactions.

ACME ELECTRIC LAMP CO., LTD., London, S.W.—Satisfaction registered April 2nd, £2 551, registered June 9th, 1925.

BRIDGWATER AND DISTRICT ELECTRIC SUPPLY AND TRACTION CO., LTD.—Satisfaction registered March 25th, £13 050, total issued of amounts registered February 6th, 1905, and April 29th, 1914.

EDMUNDSONS' ELECTRICITY CORPORATION, LTD., London, S.W.—Satisfaction registered March 28th, £480 000, registered November 21st, 1902, to January 22nd, 1906.

RADIO SERVICE (LONDON), LTD.—Satisfaction registered April 5th, £125, part of amount registered July 26th, 1927.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HODGETTS (S. AND F.), LTD., brass founders and wood turners, Argonaut Works, Bishop Street, Birmingham. (P.M., 19/4/29.) This company was formed in the middle of 1927, with a share capital of £3 000 in £1 shares, all of which were issued as purchase consideration for the business taken over from the trustees appointed under a deed of assignment executed by Samuel Hodgetts, its proprietor, for the benefit of his creditors. The directors of the company, according to the latest official information, are Samuel Hodgetts, with 1 800 shares, Norman S. Crowley 1 000 shares, and Robert H. Warren 200 shares. A first mortgage debenture for £2 500 was given to Crowley, who has recently appointed a receiver.

WILCOX, A. H., and SPARROW, H. D., trading as WILCOX, SPARROW AND CO., Chapel Ash, and Merridale Lane, Wolverhampton, wireless dealers. Creditors were called together on April 11th at Wolverhampton, when it was reported that the liabilities amounted to £1 290, of which £960 was due to trade creditors, against total net assets estimated to produce £602, or a deficiency of £688. It was stated that the company's bankers were creditors for £139, but were collaterally secured by Mr. Sparrow, sen., to the extent of £100, while they also held two life policies on the lives of the debtors. There was a fully secured creditor for £254, this being the Wolverhampton Freehold Building Society, and they held a first mortgage on the property. Mr. Sparrow, sen., held a second mortgage, the amount of which at present, including interest, was £511. It appeared that the debtors had a lease of the Chapel Ash premises for five years from September 29th, 1928, and this shop was opened on October 26th, 1928, but the turnover had been very small. It was also stated that in the middle of March last, the debtors assigned book debts to the extent of about £150 to Mr. Sparrow, sen. Dissatisfaction was expressed at the position, and it was ultimately decided that the debtors be given 14 days in which to find a cash composition of 10s. in the £, security to be found to the satisfaction of a committee of inspection. Failing this arrangement being made, steps were to be taken for administering the case in bankruptcy.

London Gazette, etc.

Companies Winding-up Voluntarily.

ALLAN (WILLIAM) AND CO. (LIVERPOOL), LTD.—By reason of its liabilities, April 8th.

GIBBS AND WHITE, LTD. By reason of its liabilities, April 8th, H. J. E. Batchelor, 44, Above Bar, Southampton, Incorporated Accountant, appointed as liquidator.

WESTERN ELECTRIC CO., LTD. By special resolution March 25th, confirmed April 9th, C. A. Fryer, Chartered Accountant, 38, Gresham Street, E.C.2, appointed as liquidator for the purpose of reconstruction.

Notice of Dividend.

SHARPE, Henry Clifford, 4, Gordon Terrace, Dorchester, wireless engineer. First and final dividend, $3\frac{5}{16}$d. per £, payable April 17th, Official Receiver's Office, City Chambers, Catherine Street, Salisbury.

Notices of Intended Dividends.

POWELL, Hector Baden, 10, Union Street, Hereford, wireless dealer.—Last day for receiving proofs, April 26th. Trustee, O. B. Wallis, 133, Saint Owen Street, Hereford, Official Receiver.

TEMPLE, Edward, and BURKETT, Jane Eva (Mrs.), 105, Canterbury Street, South Shields, Durham, wireless dealers and electrical contractors, trading as THE WESTOE ELECTRICAL CO. Last day for receiving proofs, April 22nd. Trustee, A. J. Gray, 48, Pilgrim Street, Newcastle-upon-Tyne.

YEEND, Reginald, electrician, trading as the CENTRAL ELECTRICAL WORKS, lately 57, West Street, Wisbech, and Red Lion Street, Spalding. Last day for receiving proofs, April 26th. Trustee, F. H. Langmaid, 41, Sidney Street, Cambridge, Official Receiver.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

281 344 Dr. B. Schwarz. Induction motors. (29/11/26.)
306 990 Automatic Telephone Manufacturing Co., Ltd. and T. P. Preist. Testing-devices for impulse senders. (30/11/27.)
306 991 Automatic Telephone Manufacturing Co., Ltd. and W. Saville. Telephone systems. (30/11/27.)
281 674 G. F. Jaubert. Colloidal diaphragms for electrolytic cells. (1/12/26.)
306 995 A. Reyrolle and Co., Ltd. and G. E. Grace. Load-sharing arrangements for dynamo-electric machines. (1/12/27.)
306 996 General Electric Co., Ltd. and N. R. Campbell. Manufacture of photo-electric cells. (1/12/27.)
307 099 E. Y. Robinson and Metropolitan-Vickers Electrical Co., Ltd. Manufacture of electron-emitting bodies. (1/12/27.)
306 999 R. H. Smith. Cycles and similar light vehicles adapted for laying telegraph wires and the like. (1/12/27.)
281 692 Siemens-Schuckertwerke Akt.-Ges. High-tension electric cables. (2/12/26.)
281 698 Dr. A. Schmid. Galvanic cells. (2/12/26.)
307 106 British Thomson-Houston Co., Ltd. and A. P. Young. Electro-magnetic acoustic devices, such as loud speakers. (2/12/27.)
307 121 English Electric Co., Ltd. and G. Schroeder. Regulation of asynchronous alternating-current machines. (9/12/27.)
282 386 Siemens-Schuckertwerke Akt.-Ges. Method of and means for preventing faulty action due to the effect of the magnetic field of the current circuit in cable protective devices. (14/12/26.)
307 127 F. J. Wineberg. Electric fires or radiators. (13/12/27.)
307 131 W. V. Butterfield, A. W. Butterfield and S. Butterfield, (trading as Mycromet Manufacturing Co.). Cord-grips for electric fittings and appliances. (15/12/27.)
307 138 Siemens Bros. and Co., Ltd., T. S. Robertson and W. E. Goodwin. Electromagnets and electro-magnetically-operated devices. (22/12/27.)
307 158 P. Ratzsch and E. Stracke. Protective device for plugs for electric plug contacts. (16/1/28.)
284 623 Westinghouse Lamp Co. Evacuation of closed vessels. (1/2/27.)
307 173 C. L. Arnold and M. K. Electric, Ltd. Methods of insulating the exposed parts of the metal bridges of the tumbler type of electric switch. (31/1/28.)
307 177 A. R. Jones. Wireless receiving systems. (7/2/28.)
307 181 Pictorial Machinery, Ltd. and B. Cook. Apparatus for controlling the exposure of a unit to a source of electric light. (8/2/28.)
307 192 H. T. Stott. Combined clock and wireless loud speaker. (11/2/28.)
285 497 International General Electric Co., Inc. Manufacture of insulating-tapes or the like. (18/2/27.)
286 308 Siemens and Halske Akt.-Ges. Electrodynamometers. (3/3/27.)
307 210 Callenders' Cable and Construction Co., Ltd. and F. H. Simkin. Cleats for supporting electric conductors. (3/3/28.)
307 211 A. Chalmers. Junction boxes for electrical cables. (3/3/28.)
286 732 Schieferwerke Ausdauer Akt.-Ges. Method of producing moulded articles, such as sheets and the like, suitable as insulating-material for electro-technical purposes, from filling materials and artificial resin. (10/3/27.)
287 074 G. Mombur. Electric speed-indicating apparatus. (12/3/27.)
307 217 Smith, Major, and Stevens, Ltd. and P. H. Stevens. Automatic stopping devices for electric lifts. (13/3/28.)
307 221 A. J. Howard and L. V. Turner. Boiling-plates for electric cookers. (28/4/28.)
288 285 G. Mombur. Electric speed-indicating apparatus. (8/4/27.)
307 231 Naamlooze Vennootschap Hengelosche Electrische en Mechanische Apparatenfabriek and A. Booden. Star-delta method of starting alternating current motors. (31/3/28.)
307 237 L. Mellersh-Jackson (Federal Telegraph Co.). Radio receiving systems. (11/4/28.)
289 431 Etablissements E. Belin. Picture-telegraph and the like apparatus (27/4/27.)
289 059 British Thomson-Houston Co., Ltd. Apparatus for measuring a low gaseous pressure such as that of a vapour-electric discharge device. (21/4/27.)

Current Topics.

A Serious Problem.

PUBLIC agitation against the erection of the new power station at Battersea continues to gain in force, and has now reached a point at which it may cause grave embarrassment to the electricity supply industry. While we must confess we see little if any reason why the new station should be erected at Battersea, we are, for the moment, not concerned with this part of the question. The really serious aspect, as we have pointed out more than once of late, is that a public utility service proposes to give offence to a large number of consumers and potential consumers of its product, a policy which is obviously not in the best interests of electrical development. The unwisdom of affecting to be unaware of the public's feelings in a matter like this is surely obvious, and we would say in all seriousness that the time has come when not merely the London Power Co., but the whole of the electricity supply industry should get to grips with the problem of mitigating the nuisance and damage due to flue gas emissions. The problem is undoubtedly a difficult one, and although some people are inclined to regard it as impossible of solution, we venture to remain optimistic, basing our hopes on the oft-proved fact that once there is a sufficiently pressing demand for cure, the remedy is nearly always forthcoming. The Battersea outcry, has, it is true, led to the announcement that the Government chemist is to watch the results of certain laboratory experiments for the elimination of sulphur fumes, but we must not delude ourselves into thinking that there is now nothing to be done but wait the results of these experiments. By a curious coincidence, the smoke nuisance is the subject of simultaneous discussion in the American electrical industry. There, as here, the cost of developing and installing protective equipment is advanced as a bar to its use, but as our contemporary, "The Electrical World," points out, the cost of preventing air pollution must be considered as one of the social costs of modern life, a desirable condition of which is that no user of fuel should discharge gases into the atmosphere that are less clean than the air he takes from the atmosphere and delivers under his grate.

The E.H.T. Conference.

THE International High-Tension Conference which was founded in 1921, under the auspices of the International Electrotechnical Commission, and which is, apart from the latter, one of the oldest and most important international bodies dealing with electrotechnical matters, has arranged to hold its fifth session in Paris from June 6th to 15th. Already 380 members from twenty-one countries have signified their intention of being present, and it is anticipated that the 1927 attendance of 544 delegates will be exceeded. Altogether 98 papers have been sent in from eighteen different countries; of these, thirty-three deal with construction and materials, a feature being those papers connected with generators, transformers and transformer coils, thirty-three are concerned with the construction and insulation of lines, including electrical and mechanical features relating to switchgear, cables, bare conductors, insulators, overhead line supports of steel, concrete and wood, and problems relating to their maintenance; and thirty-two papers deal with the lay-out, calculation, operation and protection of lines and networks, including problems connected with lighting effects, surges, protective relays, grounding of neutrals, snow loading, load despatching, measurement, and inter-station communication. Information about the conference can be obtained from M. TRIBOT LASPIÈRE, at 25, Boulevard Malesherbes, Paris, but engineers in this country who wish to take part should communicate with Mr. P. F. ROWELL, at the Institution of Electrical Engineers, London.

The Incandescent Lamp Jubilee.

WHEN last we referred to the arrangements which are being made in America for the "celebration of the fiftieth anniversary of the invention of the incandescent electric lamp," we charitably inferred that the claim that Mr. EDISON was its inventor was due more to oversight than a deliberate desire to belittle the prior achievement of the late Sir JOSEPH SWAN. Later information, however, makes it clear that the claim is being deliberately pressed, so that arrangements for a world-wide celebration on an unprecedented scale are now being put in hand. The celebrations, we learn, will start on June 1st and will continue until October 21st, which, we are told, "is the actual birthday of electric light." This date will be celebrated as the "Night of Light." "A radio programme, the first to be broadcast internationally, is being planned, that will outshine anything ever put on the air before," and we are assured that

Digitized by Google

" President Hoover, Lindbergh, Ford, and the greatest men of foreign lands will pay their respects to THOMAS EDISON while the world listens in." The fact that we in this country last year very quietly and soberly celebrated the invention of SWAN'S incandescent lamp does not seem as yet to have penetrated to the United States, and we therefore suggest that official steps should be taken to put the National Electric Light Association of America in possession of the true facts.

An Advertising Scandal.

ELECTRICAL manufacturing firms have for some time been worried by the growing practice on the part of certain of their customers of asking them to pay for advertising space in house organs and other ephemeral publications as a condition of a continuation of the existing business relationship. The purchase of orders with advertising space is a thoroughly bad procedure, and, apart from the ethical standpoint, represents not only a waste of money, but also reduces the average return per pound spent over an advertising appropriation. Some idea of the extent to which these blackmailing tactics are practised on electrical firms was disclosed by Mr. C. PINKHAM in a lecture to the Glasgow Publicity Club last week, and we hope that his exposure of a serious advertising scandal will lead to a discontinuance of an unmitigated abuse of reciprocal business methods.

Practical Rural Electrification.

THE Special Order which the Electricity Commission has just granted to Mr. R. BORLASE MATTHEWS, for the supply of electricity to an area of 1 281 square miles in Lincolnshire, is of particular interest, as the scheme will be the first serious attempt in this country to supply an entire region (including towns, villages, hamlets and farms). Naturally its development will be watched with the greatest interest, for the " back to the land " cry can be of little avail unless some of the amenities of the town are present and the means—afforded by electricity—of earning as good a livelihood there as in the city, are available. For the county of Lincolnshire itself the scheme should usher in an era of farming prosperity and promote rural industrial life. From the point of view of the rest of the country it will provide a demonstration of what can be done elsewhere.

Welded Products Again.

THE welded steel fabrication alternative to castings is well known and widely used by the manufacturer of modern electrical machinery. For many stationary parts, and of late increasingly for many rotating elements, the service has much to recommend it. Cost, as such, is often the least important factor in the reckoning. Indeed, founders might here take heart of grace, and make a determined bid for custom in cases where ingenuity and initiative on their part would raise the service they can offer into a favourable competitive position. The art of the welder has so developed of late that welded products are now very reliable, repairs are often greatly simplified, and damaged work formerly taken down and possibly replaced at great expense of time, labour and cost, is now repaired on the site by this means. Welding is rapidly coming into its own in constructional work generally, and it is being used more and more extensively in bridge building and for building up columns, roof trusses, plate girders, and the like. A further application referred to in the discussion which followed the two recent papers dealing with water-tube boilers before the Institution of Naval Architects is the growing Continental practice of using welded boiler drums. The case of one firm was instanced which alone had manufactured 800 such drums. These, in service in different countries, were giving every satisfaction, the range of pressures for the series varying between 200 and 850 lb. per sq. in. It is also noteworthy that both the Board of Trade and Lloyd's Registry have recently approved, in the case of the new P. and O. turbo-electric liner, that all the main steam pipes should have arc-welded flanges. Welded products should of course, be considered strictly on their merits, but where conditions are such as to warrant a departure in manufacture, the welding proposition has much to recommend it.

Copper and Fittings Prices.

IT is only natural that the recent increases in copper prices should exert some influence on the prices of manufactured goods, but it is arguable that the firms who have announced increased prices for lighting fittings are by this action making still easier the way of those fittings makers who combine a maximum of glass with a minimum of metal in their productions. At a time when conventional designs—of which there seem to be heavy showroom stocks—are meeting with increasing competition from the newer forms, price increases in the former may quite conceivably benefit the latter.

The Wave-length Problem.

THE decision of the European broadcasting authorities, at the conference at Prague last week, to agree to a further allocation of wave-lengths throughout the British and Continental stations, is more or less the result of the failure of the Brussels plan which came into force last January. Though in theory the latter arrangement gave every station an uninterrupted wave-length, in practice it was found that many of the continental stations failed to hold their transmission to the scheduled number of kilocycles, with the inevitable result that side-bands clashed. To-day it is often impossible to separate one station from another for no reason other than that one of them is off its correct wave-length, and while such wandering is free from penalty, there seems little chance of there ever being a complete absence of heterodyning. From the point of view of trade we hope that the Prague plan will be adhered to, for nothing is more disheartening to the listening public than to be unable to separate a desired programme from an interfering whistle. While there appears to be no restriction as to the number of broadcasting stations which may be erected in Europe, the same troubles of wave-length allocation are bound to occur, for though it may be arranged that a ten kilocycle gap be allowed between each station, it takes only one new-comer to upset the scheme. The present recognised broadcast band of from 200 to 600 metres, approximately, should, we think, be occupied by the present transmitters, any new station being compelled to work on a long wave-length. Existing stations defaulting as to wave-length should be penalised and transferred to the long waves as " punishment," thus relieving the shorter band to some extent. When it is remembered that the 200–600 metre band is crowded with stations, while the higher wave-lengths are, so far as broadcasting is concerned, practically unused, it seems strange that new stations do not prefer to work on wave-lengths which they know to be wide of those used by other stations, thus more or less guaranteeing an uninterrupted reception for their listeners. The popularity of the shorter waves is very definitely pronounced, but why this is so we are unable to say.

The May Selling Campaign.

THE selling campaign of the Electrical Development Association for next month is devoted to electric cooking. As in previous months special literature and posters have been prepared, while a special series of advertisements is included in the month's activities. The May window display fitting is something in the nature of a departure from those of earlier months, and introduces a cut-out figure of a woman attending to her duties in the kitchen. The arrangement is still possessed of the simple style which has characterised the E.D.A. windows so far, and no doubt considerable additional interest will be created wherever the window is shown. Some idea of the scheme may be gathered from the illustration of a suggested arrangement reproduced elsewhere in the issue.

HIGH-VOLTAGE BUSHINGS.

The Condenser Type Bushing—Principles of Nagel and Fortescue Designs—The All-bakelised Process—An Impartial Comparison of Types.

By W. H. THOMPSON, A.M.I.E.E.

(*Concluded from page* 466.)

AN attempt is made in the condenser type of bushing to exert a certain control on the distribution of the electrostatic field. But this control can be exercised within only very narrow limits. The greater accomplishment of this class of bushing is its ability to accommodate its dielectric to the flux distribution.

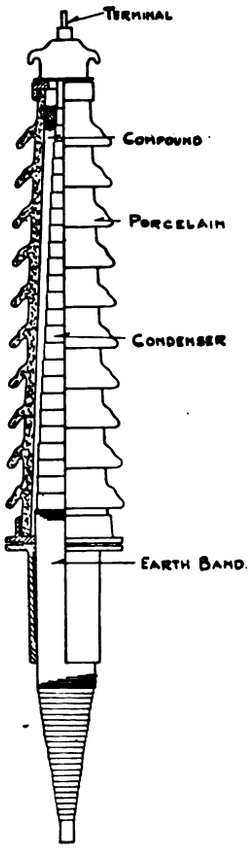

Fig. 5.—Condenser terminal.

It is made up of a central conductor surrounded by a solid dielectric, embedded in which there are a number of metal cylinders, all concentric with the conductor. This, it will be observed, forms a set of condensers in series.

At a given potential, the conductor will carry a definite charge per unit length. This will induce, on the inner surface of the first metal cylinder—or layer—an equal and opposite charge; from which will result, on the outer surface of this layer, another charge, that will be equal in magnitude and sign to the charge on the conductor. But these equal charges are spread out over different areas, since the superficial area per unit length of the outer surface of the first metal layer, is greater than that of the conductor. Therefore, the surface density will be less at the surface of the first metal layer than it is at the surface of the conductor.

By Coulomb's law, intensity equals 4π times the surface density; from which it follows that the intensity, or potential gradient, is less across the dielectric thickness between the first and second metal layers than it is across that between the conductor and the first metal layer.

The same reasoning follows for each metal layer, and, therefore, in order to maintain a constant radial stress, the dielectric thickness between the metal layers will need to diminish from the conductor outwards. Even this does not obtain constant radial stress in the strict sense of the words, since there will be a small variation through each thickness of layer. Here, then, the field flux has not been controlled, but the dielectric has been accommodated to it, by varying the thicknesses of the layers.

The condenser design assumes that the same total flux passes through each layer, or that the displacement is constant for all layers.

In practice, this is not strictly true, since there is an admittance to ground from each layer. Also, on account of the shortening of the metal layers, as they near the earth band, the flux from the exposed ends of each layer will pass into the rims of the next layer and cause a flux concentration there. This is contrary to the theory of flux control, as there will be a comparatively higher stress in the dielectric adjacent to the metal layer edges. Sometimes, the dielectric medium is "radiused" between layers, instead of being left "square," in order to reduce to a minimum the corona formation that tends to occur as a result of the above flux concentration.

But to resume, if R is the intensity, then, by Maxwell, the displacement will be $\frac{RK}{4\pi}$, and this is equal to the surface density. Again if Q is the total charge on the metal layer of radius r and length l, then $Q = KCV$; where K is the dielectric constant; C the capacity, and V, the voltage. And, from this, the surface density will be $\frac{KCV}{2\pi rl}$. Therefore, the theory of constant displacement for all layers is mathematically expressed as:

$$\frac{RK}{4\pi} = \frac{KCV}{2\pi rl}$$

From which,

$$2CV = Rrl$$

or,

$$R = \frac{\text{Constant}}{rl}$$

That is, the intensity times the radius times the length of the metal layer is constant. If then, the intensity R is to be constant, i.e., constant radial stress, rl will be constant. This, however, is the condition for a hyperbola with the conductor

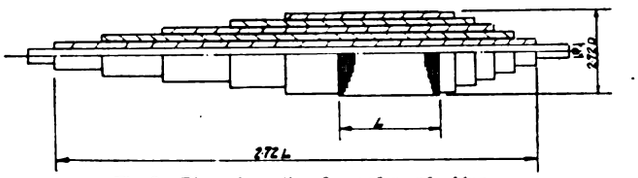

Fig. 6.—Dimension ratios of a condenser bushing.

as one of the asymtodes; which means that the ends of the metal layers will be on a curve of that order. There will then result a condition of unequal axial stress, since the difference in length of these layers is unequal, while the voltage between them is constant.

The above is the principle of the Nagel design. The Fortescue design aims at equal axial stress, and allows unequal radial stress. In this case the metal layers are arranged so that the capacity between any two layers is equal. Therefore, with C constant in the equation, $Q = CV$; V becomes the same for each step; the charge being considered constant. It will thus be seen that, if the lengths of the metal layers are arranged to be in arithmetical progression, the axial stress will be constant. And this is the condition which obtains in this design. Again, it will be noted that, on account of the admittance to ground from each of the layer ends, the theoretical conditions are not strictly borne out in practice.

The capacity of each step will be given by the equation

$$C = \frac{lK}{2 \log \varepsilon r_0/r_1};$$

which is obtained from the geometric capacity of coaxial cylinders, where l is the length of the step, r_0 and r_1 the radius of the outer and inner metal layers forming the step. From the conditions of the case, the values of l will form a series in arithmetical progression; therefore the corresponding values of $2 \log \varepsilon \frac{r_0}{r_1}$ will necessarily form a similar series in order to keep the value of the capacity equation constant.

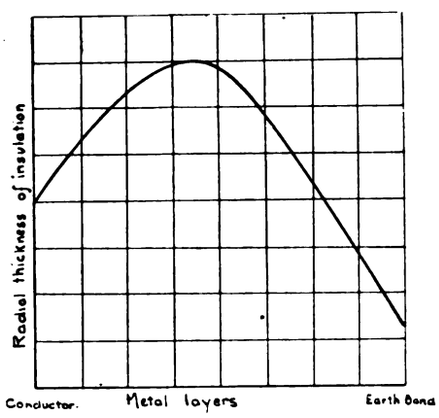

Fig. 7.

It will be found that if the log of the ratios of the radii of metal bands are to form an arithmetical progression, the difference between the radii of successive metal layers will not be constant. That is, the thickness of step is not constant. And it can be proved that these step thicknesses form another series which can be expressed by an equation to a parabola. Or, if the number of the step be plotted against the thickness, the resulting curve is a parabola. See Fig. 7.

Digitized by Google

There can be considerable diversity in the design of bushings based on the Fortescue principle. For instance, in most American and British makes, the metal cylinders are made of tin foil sheet; whereas there is a German make in which these cylinders are composed of a fine copper wire net of large mesh. From Maxwell's " Theory of a Grating " it would appear that, when the mesh is small, the approximation to a plane surface is sufficiently accurate for practical purposes. Experience bears this out, and proves that a large mesh metal layer is inferior to a sheet metal layer for bushing work.

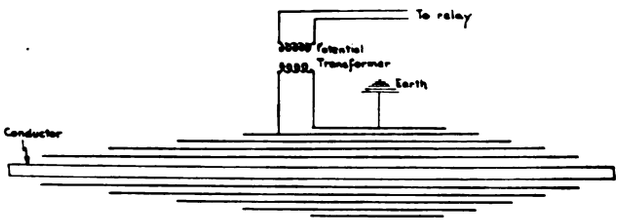

Fig. 8.—Method of obtaining potential supply.

In another make, insulated metal clad cylinders are used; these being pushed one within the other. But this method is much inferior to the all-bakelised process as practised by M.V. Co. for instance.

The diameter of the bushing is important in so far as the greater this is the more inaccurate will be the ring type current transformer, when mounted. Both the oil-filled type, and condenser bushings have a definite earth band diameter for a given conductor diameter, which will give the minimum voltage gradient on the surface of the conductor.

This is when the ratio of earth band diameter to conductor diameter is equal to ε, the base of Naperian logs. It can easily be proved as follows:—Let r equal conductor radius and b equal earth band radius, then G the voltage gradient, will equal

$$\frac{dv}{dr} = \frac{v}{r \log \varepsilon b/r}$$

This will be a minimum when $r \log \varepsilon b/r$ is a maximum, or, when $d[r \log \varepsilon b/r]/dr = O$; which occurs when $b/r = \varepsilon$. See Fig. 6. It will be appreciated that the above does not apply to the oil-filled type to the same extent, even when insulating cylinders are fitted, since the presence of these cylinders does not constrain the flux to the true radial direction, as is the case with metal cylinders. Except for the flux immediately under the earth band, the field will comprise curved lines from the conductor to band edges; which lines will suffer refraction in their passage through each insulating cylinder.

Actually, in neither type of bushing is the above proportion obtainable, although in the condenser type it is nearly so.

It is sometimes claimed that the greater the number of steps of a bushing the more accurate will be the stressing of the dielectric. While to an extent this is true, practice proves that a certain latitude is available, and that a rather coarser stepping gives the better result. The capacity of the bushing, as a whole, is independent of the number of steps.

Comparison of Types.

Having dealt in certain detail with the two most important type of bushings, it will now be interesting to compare them. The object of this comparison is not to favour one or the other design; but to state their cases, and leave the selection to the choice of those engineers whose business it is to use them.

On the question of size, it will be noted that, as regards length, the two types are much the same; but as regards diameter, the oil-filled bushing is larger. This is an advantage to the condenser type, since its smaller diameter permits the use of more accurate ring type current transformers. Also, the current transformers are much more accessible in the condenser type than in the other. Reference to Fig. 4 (THE ELECTRICIAN, April 19, page 466) will show how difficult it is to remove a current transformer from an oil-filled bushing. On the other hand, there should be little reason to interfere with these transformers once they are installed.

It will be understood that, in the case of the condenser type, porcelain shields, both above and below the earth band, can be dispensed with when these bushings are required for indoor transformer use only. In the oil-filled type they are obviously always an essential.

For oil circuit breaker use, the lower porcelain becomes a necessity in the condenser type also. It is then known as the " arc shield," since its function is to protect the lower steps of the bushing against the arc which results upon the opening of the circuit breaker under load. The space between this arc shield and the bushing is filled with pure oil, and it is a sealed chamber with respect to the circuit-breaker tank. By this means the dielectric strength of the oil is maintained across the lower end steps, irrespective of the condition of the oil in the tank.

In the event of the circuit breaker opening under a heavy load, it is possible that the arc of rupture may crack the arc shield of the bushing. If the bushing be of the condenser type, its condition, although impaired, will still be serviceable; but if it be an oil-filled bushing, it will be rendered quite unserviceable, on account of the oil running out into the tank and leaving the top portion of the bushing empty. This, of course, is because the oil in the top part of the bushing, being above the tank oil level, provides the necessary hydrostatic " head."

In the oil-filled bushing, flashover will occur at either the air or the oil end, dependent upon the design. This, and the condenser type, are generally designed for flashover at the air end, and arcing horns are preferably fitted to give this flashover a definite value.

There is the additional possibility in the condenser bushing of a flashover across the bushing steps. It is to prevent this that the precaution is taken of maintaining pure oil under the arc shield, as mentioned above. At the " air " end, the steps are longer and the space between bushing and porcelain rainshed is filled with compound. On indoor type bushings, when rainsheds are not fitted, the " air " end steps are formed only with the tin foil layer; the bakelite being of uniform outside diameter throughout its whole length.

Flashover should Precede Puncture.

The design of both types should also be that flashover shall precede puncture. This is more important in the case of the condenser bushing, since it is an advantage of the oil-filled type that a puncture will be immediately resealed by the liquid dielectric; and, it is claimed, will be good for 95% of the voltage at which it punctured. A puncture in the condenser type will destroy the bushing.

It is generally accepted that a part of the energy of an electric field is absorbed in heating up the dielectric, and

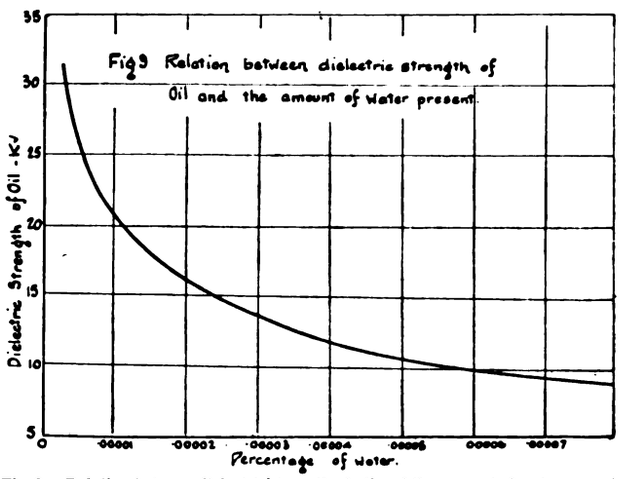

Fig. 9.—Relation between dielectric strength of oil and the amount of water present.

consequently temperature variation results within the dielectric from the uneven flux distribution. The higher the temperature, the greater the heat generation, and, if the rate of energy absorption with temperature is greater than the rate of cooling with temperature, breakdown of the dielectric is inevitable. On this point the oil-filled bushing has the advantage; as the creation of hot spots in the dielectric is prevented by the cooling action set up by the convection currents which result in the liquid.

If the air and the oil are each stressed simultaneously to their respective maxima, flashover at the air end will result, rather than at the oil end. This is because the oil has a greater time lag than the air.

A definite time is required to effect the rupture of any dielectric, since the rupture represents the expenditure of energy, and time is a factor in the fundamental dimensions of energy. That being so, it is obvious that with the same given potential across different dielectrics, the time factors will vary

Digitized by Google

in accordance with the energy required to break down the different dielectrics, or, what is the same thing, upon the strengths of the dielectrics. Therefore, as the dielectric strength of oil is greater than that of air, so also is its time lag longer.

When either type of bushing is used outdoors, it is subject to a fairly wide range of temperature variation, and allowance must be made for expansion and contraction. A flexible lead between the top end of the conductor and the terminal provides the necessary allowance for thermal movement in the condenser bushing of the Metro-Vick design, but in the oil-filled type, it is a difficult proposition to make allowance for this movement, and the writer knows of no make of oil bushing which incorporates such a feature.

In the case of the compound or oil, sufficient space is left to accommodate something above the maximum expansion expected. The coefficient of volumetric expansion of oil is 0·001 per deg. C., and that for compound is approximately 0·0006 per deg. C. As, however, the volume of oil required for an oil-filled bushing is much more than the volume of compound required for a condenser bushing, there is a much greater total expansion of oil than of compound than that indicated by the ratio 0·001/0·0006. Oil-filled bushings in Russia, subject to the temperature variations there, have shown oil level differences of as much as 6 in.

This feature of the oil-filled bushing has necessitated fitting to it an air vent, which allows easy access and egress of the air in the top space, and the function is known as the "breathing" of the bushing. It is undoubtedly a disadvantage, since a damp atmosphere can be breathed in, and the moisture condensed in the air space above the oil level. The water so formed will run down into the oil, and being heavier than the latter, will sink to the bottom. In this way water can collect in the bottom of the arc shield, and also cling to the sides of the baffle tubes, when fitted. See Fig. 9.

Nowadays, porcelain rainsheds are made in one piece for bushings up to 132 000 V; above this pressure, two-piece rainsheds are used. The one-piece porcelain is a great advantage to the oil-filled bushing, as it reduces the number of oil-tight joints required. It is believed that some of the biggest manufacturers can to-day justify the hitherto doubtful claim of producing a really "oil-tight" joint. If this is so, then one of the biggest disadvantages to the oil-filled bushing has been removed.

There is, however, the fact that the rainshed of a condenser terminal may be broken to quite an extent and the bushing remain serviceable, but a crack in the porcelain of an oil-filled bushing will enable the oil to escape and render the bushing useless.

As regards the relative watt loss of the two types of bushings, it must be allowed that here the oil-filled bushing has the advantage. So much depends upon the amount of moisture absorbed in the solid dielectric that the power factor may vary to any extent between 0·01 and 0·2. This is not the case with the oil dielectric, which also has the advantage that the anomalous charging current is not reversible, as it is with a solid dielectric.

This subject of absorption and power loss in dielectrics is of considerable complexity, and the writer would refer those interested to the "Critical Resumé," which appeared in an issue of the Institution Journal.*

It is possible to continue to a considerable length the comparison of the two types of bushings. No mention has yet been made of the advantage of an oil dielectric in preventing the formation of internal air pockets and the consequent corona; nor yet of the advantage of the metal layers in stopping a progressing corona. The condenser type also provides the convenience of taking a potential tap for the operation of relays, etc. See Fig. 8. But, as an article must end somewhere, it is hoped that the above will be sufficient to stimulate the interest of engineers to a deeper study of the subject.

BOOK REVIEWS.

The Theory of the Gyroscopic Compass and its Deviations. By A. L. RAWLINGS. (London: Macmillan and Co.) Pp. x+191. 10s. 6d. net.

Although the first three chapters are largely restatements of existing knowledge, the major portion of this book is made up of original matter which has not yet been confirmed by other workers. The mathematics of the early chapters do not prove easy reading, but, as the whole book is designed largely as a work of reference, the skipping of these portions is not a serious matter. While elementary knowledge of the Differential Calculus is considered necessary to a full understanding of the subject, the non-mathematical reader need not be discouraged, as alternative explanations are given in plain language wherever possible.

In tracing the development of the various forms of the gyro-compass, and the inventors responsible for them, the author treads controversial ground, but, though his own views are easy to see, he also presents data from which the reader may draw his own conclusions.

L. A. C.

A Bibliography of Metallic Corrosion. By W. H. J. VERNON, D.Sc., with an introduction by PROF. H. C. H. CARPENTER, F.R.S. (London: Edward Arnold and Co.) Pp. xii+341. 21s. net.

There is hardly a subject upon which during the last twenty years or so, more attention has been focussed than that of corrosion, a broad and comprehensive term covering a wide range of phenomena. To engineers and others concerned with the durability of the metals and alloys they use, it is practically impossible to keep abreast of the enormous and scattered literature which has sprung up relative to the causes of corrosion, its modes and the methods of preventing it, or at least, of mitigating its effects. Dr. Vernon has done well, therefore, in compiling a bibliography of the subject, and has discharged his task in a very able manner. Not only is the arrangement of the various headings such as very greatly to facilitate reference to the available literature on any particular subject, but some guidance as to the nature of the various books, papers and articles referred to is afforded in the shape of occasional critical notes. It may well be wished that when other branches of science reach the stage of having a bibliography devoted to them, their compilers may perform the task as well as Dr. Vernon has done his. The book is divided into four main sections: (I) General, in which the various factors influencing the corrosion process are classified; (II) a bibliography arranged under the main groups of corroding media; (III) a grouping under the headings of the specific metals and alloys themselves, and (IV) an exhaustive bibliography of the various methods employed for the prevention of corrosion, and for the protection of metals and alloys prone to corroding influences. The book is clearly and well printed, and its contents appear to have been carefully checked, for it is free from the mistakes and omissions which so often detract from the value of a work of this kind.

L. P. S.

Die Technik Elektrischer Messgeräte. Third Edition. By G. KEINATH. Vol. I.: Messgeräte u. Zubehör. Pp. viii+612. Vol. II: Messverfahren. Pp. viii+416. (Munich and Berlin: R. Oldenbourg.) Price, bound: Vol. I, 35 Rm.; Vol. II, 24·5 Rm.

This work has reached its third edition, having been published first in 1921. Its wide scope is best indicated by the chapter headings:—Vol. I: General Features, Materials, Description of Instrument Movements, Recording Apparatus, Auxiliary Apparatus. Vol. II: Measurement of Voltage, Current, Power, Power Factor, Frequency, Synchronizing Gear, Remote Measurement, Measurement of Resistance, Capacity, Inductance, Speed, Time, Distance, Acceleration, Pressure, and Magnetic Quantities. The field of test and measurement in which electrical methods are applicable is seen to be well covered. It is difficult to give the author adequate praise, for within the limits of treatment assumed, the subject could scarcely have been better dealt with. It should be noted that the author does not set out to teach principles, but to record practice in its latest and most modern form. The general treatment is to present the elements of the essential theory, followed by a critical examination and concise technical description of the instrument, material or process under discussion, and illustrated by line drawing curves, and half-tone blocks.

In the introduction a useful section on errors, sensitivity, etc., and their dependence upon mechanical considerations, is given, together with details of spring control, instrument torque measurement, suspension, mechanical testing, forms of construction, scales, damping, insulation, overloading, and

* I.E.E. Journal, No. 359, Vol. 64.

Digitized by Google

sensitivity to external variations of frequency, temperature, etc. A great range of detail, clearly sectionalised and subdivided, is given in each subject, and cannot fail to be of considerable use to all concerned with or interested in instruments. A lengthy appendix presents an interesting analysis of a number of national standardising rules and specifications for instruments, which should be informative for the purposes of comparison and for the preparation of instruments for the foreign market. The 900 illustrations are clear and carefully arranged, the line blocks illustrating parts, principles and connections being especially good, while the half-tones are adequate. Naturally, many of the typical instruments illustrated are of German origin, but the author has included also British and American examples, particularly of the more delicate and precise types. The format, binding and typographical work are a good example of a high-class technical publication. This work became a standard in its earlier editions, and the new edition places it in the forefront of treatises on measuring instruments and measurements.

S. PARKER SMITH.

Electricity Applied to Mining. By H. COTTON. (London: Sir Isaac Pitman and Sons). Pp. xi+625. 35s. net.

This book comes very opportunely at a time of growing realisation that the mining industry in this country must employ electric power on a far larger scale than hitherto if it is to continue to exist. It is almost encyclopædic in character, dealing with every application of electricity in coal mining in a thorough and competent manner. The early chapters deal with generation, transmission, and distribution, but, as the actual technique of power production is adequately dealt with elsewhere, the author has wisely concentrated, in the section on generation, on the economics of the problem.

The method of treatment of the sections dealing with the application of electricity to mining problems is noteworthy. Feeling that the customary method of describing the electrical gear required for a particular drive, without any reference to the peculiar characteristics of the drive, is inadequate, the author has investigated the nature of the load, particularly in the case of fan, compressor, and pump drives, with sufficient thoroughness to give serviceable data to the mining electrical engineer. The most recent methods and apparatus are described, but the author's statement on page 592 that no electric safety lamp can be used as a gas detector, is incorrect, as there is certainly one electric lamp specially designed for this purpose.

The book is well printed and produced, and is very fully illustrated. It should form an indispensable work of reference for every mining electrical engineer.

H. C. B.

Draughting for Engineers. By C. L. SVENSEN. (London: Blackie and Son.) Pp. xi+363. 12s. net.

Draughting is a subject of vital importance to the engineer, no matter in which branch of the profession his work may lie. Not only must he be able to read a drawing or diagram correctly, but he should also possess the ability to visualise shape and size, or in other words, think "graphically." The author has endeavoured in as simple a manner as possible, to show how to acquire this knowledge. The first chapter contains a fairly comprehensive survey of the instruments and materials necessary, for what one might call the "draughtman's outfit."

Lettering and figuring to which scant attention have been paid will very easily spoil the appearance of a drawing, and the "junior" will obtain information of a very useful character regarding the making of the various types of letters and figures, by a careful study of the text, and a working knowledge of some of the principles and constructions of geometry, which are essential in order that clear mechanical drawings may be made, will also be obtained by reference to the third chapter. Orthographic projection is dealt with very clearly, and includes a series of practical rules and also principles of projection, which form the base of both the making and reading of drawings. The theory of dimensioning, including the system developed by the author, is also discussed.

Bolts and screws are so often used in engineering, and, as some branches of the profession have their own standards, it is necessary to know the proportions or sizes of the more common types of screws at least, and at the same time be thoroughly conversant with the various forms of designation on drawings. These will be found in Chapter VI, which is followed by a study of working drawings. Generally speaking, working drawings should be in orthographic projection, but there are, obviously, occasions such as the slots in the heads of screws, when this practice is not followed. Some of these exceptions, and also the methods adopted are given, and further the cross-section symbols adopted for indicating various materials are detailed.

Not the least important branch of engineering draughting is that of freehand sketching, and the section dealing with this subject shows very clearly how to produce a sketch that will be of a useful character. The intersecting of surfaces, development of surfaces, detail draughting, computation of weights from drawings and piping drawings have each received careful attention. Detail draughting concerns, chiefly, the main details of the horizontal steam engine, but also makes a short reference to rivets and riveting, whilst in the case of piping drawings, the data given with respect to pipe conventions and tables of pipe fittings and standard pipes will certainly serve a useful purpose.

The reason for the chapters dealing with architectural, structural, and electrical draughting is self-evident. From these the "junior" may commence his training in the branch of engineering in which he proposes to specialise. Chapter XVIII, dealing with technical illustrations and data, will, to a certain degree, be found useful, and the final chapter will materially aid the instructor, because of the variety of problems which it contains. The American projection system has been used throughout the book, so that by reference to the appendix, the difference between this and the British system will be noted.

The book is free from material errors; both the text and figures are exceptionally clear, and the book certainly does provide a systematic course of study in engineering and architectural drawing. The author is to be congratulated upon the clear and concise manner in which he has presented the subject.

S. W.

Railway Electrification and Traffic Problems. By PHILIP BURTT. (London: Sir Isaac Pitman and Sons.) Pp. xvi+197. 10s. 6d. net.

The author of this stimulating book deserves congratulation for his courage in writing a book of this character. Formerly deputy-general manager of the North Eastern Railway, and viewing railway electrification solely from a traffic officer's point of view, he is inclined to be apologetic for having produced this book without the collaboration of an electrical engineer. In the reviewer's opinion, this is one of the strong points of the book. Written wholly or in part by an electrical engineer, its views would have been suspect by railwaymen, but as its author is himself a railway man and one whose experience may not be expected to be unduly biassed on the side of any particular system of operation, it forms a welcome addition to the literature of railway electrification. While most electrical men have long believed that a properly designed policy of main line electrification affords the only real chance of re-establishing British railways on a proper financial basis, it is a hopeful augury to find that similar views are shared by Mr. Burtt. The book is well calculated to show that a considerable extension of electric working, put in hand at an early date, will not only be a national advantage, but will also be in the best interests of the railway companies. It is a book that all railway executives should read and profit by.

L. W. C.

A School Electricity. By C. J. F. WAGSTAFF. (Cambridge University Press.) Pp. xii + 250. 5s. net.

This book is intended for elementary students attending technical schools, and is based upon the author's teaching experience, which has led him to leave out many important parts of the subject which he does not think necessary to the student so early in his "electrical course." The principles of force and work, electricity and electrical measurements are very thoroughly dealt with. Much of the text is devoted to instructions for carrying out experiments, and to examples of an illustrative character; also at the end of each chapter a list of problems is given. Generally speaking, the book appears to be well adapted for its purpose, although it is a pity that the author, when revising the book for its second edition, did not bring it thoroughly up to date with regard to the various symbols (e.g., current is now denoted by *I* and not by *C*), for no doubt the student will experience a certain amount of difficulty, due to this, later on in his studies.

PROPOSALS FOR LONDON SUBURBAN RAILWAY ELECTRIFICATION.

Suggested Terminal Developments—Advice of the old G.E. Electrification Committee—Financial and Traffic Considerations.

By J. G. B. SAMS, A.M.Inst.Mech.E., M.Inst.Loco.E.

THE completion of the electrification of all London suburban railway passenger services can reasonably be considered as extremely overdue, both from the shareholders' and from the travelling public's point of view. Full credit must be given to the Southern Railway for their practically complete suburban electrification, and partial credit is due to the L.M. and S. Railway, who have gone some of the way, but the L. and N.E. Railway must be taken to task, as no effort seems to have been made at a commencement. The L.M.S. have an excellent service between Euston and Watford, and also between Broad Street and West London suburbs; they also have an interest in the "Underground" services to East Ham and Barking, which, one notices with pleasure, are to be extended in the near future to Dagenham, in order to serve the L.C.C. Housing Estate at Becontree.

Whether these new services will be run in and out of Broad Street station or whether they will form a mere extension of the existing Underground services has not yet been made public; but it is to be hoped that the idea is to run an entirely new and separate service, distinct from the Underground, which is already uncomfortably crowded at peak periods; and this will argue Broad Street as the City terminal.

Another advantage might lie in the utilisation of the suggested service to ease the present overcrowding on the Underground. And while Broad Street is under discussion, the suggestion is made that a connecting spur between the Midland main line and the ex-North London Railway should be installed, the main line electrified as far as St. Albans, and a service instituted between Broad Street and that town, paralleling the example of the Watford service of the L.N.W. section. There seems room for additional services at Broad Street, which, considering its commanding position in the City, does not handle the traffic that one would expect, seeing that it has now become the only City terminus belonging to the L.M.S. group instead of, as formerly, to a small suburban railway. Another reasonable development of the L.M.S. Barking to Dagenham scheme would be an extension to Tilbury Docks from Barking, but this would be more of a business than a residential proposition.

An Urgent Matter.

So much for the L.M. and S. Railway, and now for the L. and N.E., the electrification of the greater part of whose suburban services is a matter of first-class importance and urgency. These services can be roughly divided into the Great Central section, which, on account of the comparative remoteness of Marylebone terminus, should be placed last in electrification order; the G.N. section, and the western and eastern sections of the G.E. Railway, these last being of equal importance. There is of course no doubt that electrification *will* come eventually, but the attitude taken by the railway management gives the impression that they are trying to fight it off rather than to welcome it as it deserves. A start might be made by following the advice of an electrification committee of the ex-G.E. Railway, which in 1913 recommended the electrification of the western section (Enfield Town, Chingford, etc.) which, barring a short mile where it runs over the Cambridge main line, is a self-contained entity. In any case the widening of this short length of railway would be an advantage, as with the present steam services delay is often occasioned to main line trains by congestion at peak periods, and the starting and stopping of these heavy trains costs an appreciable sum in extra fuel and brake blocks. With the small exception noted, the electrification of this particular section offers no difficulty whatever, hence its suitability as a beginning effort. Taking the L.N.E. suburban services as a whole, and examining the peak period of traffic, with a single exception the headway between trains is never better than three minutes. The exception is the western section of the G.E., where the headway has been cleverly reduced to two minutes with six misses to the hour for recovery, giving a maximum of twenty-four trains to the hour on one set of rails. This may be taken as the irreducible minimum of headway and the last word in steam train operation where a purely suburban service is concerned. If long-distance main line services are interposed, or the possible frequency vitiated by crossings or junctions on the level, the number of trains in a complete steam service can hardly reach the suggested maximum of twenty-four to the hour, although the latest signalling, such as four indication three-colour signals, be installed.

Southern Results.

Under the same conditions of signalling, the running of forty electrically-propelled trains to the hour on purely suburban services is a proved possibility, and this is a material advance on the steam train; where steam main line services have to be interposed this figure will be vitiated, but will still give a greater possible frequency than steam. Why then has electrification been shelved? There can be but two main reasons, finance and the question of the increase of traffic necessary to warrant the outlay. The first answer that may meet these questions is to examine the Southern Railway's electrification results. In this case the traffic has increased from 50 per cent. in definitely urban areas to 100 per cent. in suburban, and the financial results are so good that the railway has been enabled to alter the whole of the existing overhead system of the central section to the standard third rail; this and other similar work being partially paid for out of revenue, a very encouraging sign indeed. The second answer is that seeing this question appears to have got as far as becoming a "plank" in the programme of one of the political chiefs, Government assistance with finance ought to be possible, it being more desirable to finance productive work than unemployment.

Coming to the traffic side of the question, there are always plenty of people who are willing, given the fast and frequent service possible with electric trains, to live up to 45 minutes (say twenty to twenty-five miles) out of town; but the service must be there to attract them. What advantages would electrification provide in this respect for the G.N. and G.E. sections? The most valuable possibility is a faster and more frequent service, which would tempt people to live farther out, to the advantage of themselves and the railway. This tendency might make the extension of dead-end branches like the Palace Gates branch an economic possibility, and would enable the reopening of the Edmonton and Cheshunt branch. Another valuable possibility would be the restoring of the old north and south services via Snow Hill and the widened lines. Years ago the Midland and the G.N. Railways ran through services via this route to Victoria, and the S.E. and L.C. and D. Railways ran return services on to the G.N. line. One of the advantages said to be possessed by the omnibuses and denied to the L.C.C. trams is that of through running across London; here then, given electrification, is the same posssibility for the railways. The same idea is applicable to Liverpool Street stations, Metropolitan and L.N.E. Railways; there is a connecting tunnel between the two systems, and it would be an easy matter for both companies' trains, now terminating each on their own side of the tunnel, to run through on to the other system. That these through runnings would be of advantage to both railway and public cannot be doubted; think, for example, of the number of terminals that would be eliminated.

Ample Scope.

The facts are that neither saturation-point nor maximum railway service has been reached in these parts; there is still ample room for a vast suburban population, given the necessary transport in the shape of electric trains. It will be argued that in several cases expensive flyover junctions and crossings will have to be installed, but these are economic necessities in any case, steam or otherwise. Consider Stratford L.N.E. as an example. Here every train of the Loughton and Fenchurch Street service (and there are a great many during the day) crosses on the level and entirely shuts up the two up and down main lines for anything from two to three minutes; and these main lines are as crowded as any in London. The economic necessity for a flyover crossing is here, previous to any consideration of electrification, and the expense of installation cannot fairly be used as an argument against its most necessary achievement.

MECHANICAL CONSTRUCTION OF LINES.

Some Tendencies in Design and Erection—Comparison of Practices in Other Countries—Relative Positions of Conductors.

By THEODORE RICH, A.M.I.E.E.

FOR a number of years there was a tendency to design the support of an overhead line under the idea that it must, as far as possible, be a rigid structure, forgetting that the primary object of the post cross-arms or brackets and insulators is to keep the conductors off the ground and out of reach.

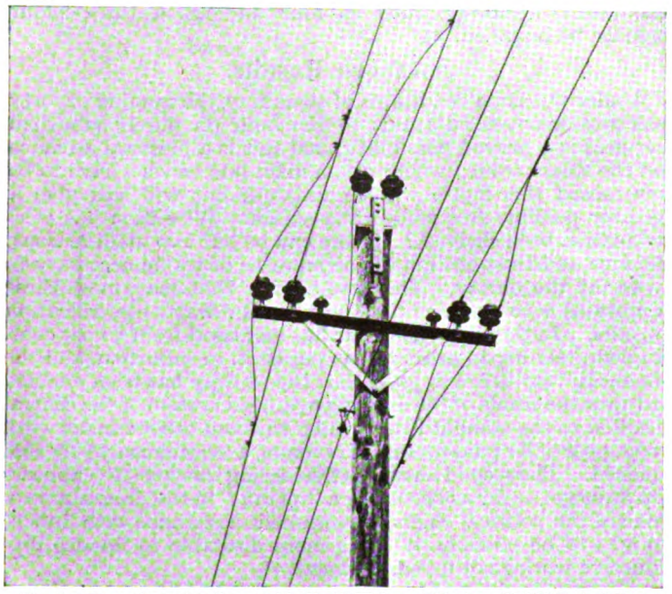

Fig. 1.—Type of construction used in North Wales. This is a 11 000 V steel line and the cross-arm is of angle iron.

In some cases engineers have asked for massive cross-arms and heavy pins, on the assumption that they must stand up to the full strain should a conductor break at the other end of the cross-arms.

In France before the war an engineer of the name of Cornez developed a system for h.t. pin insulators by which the arm was built up of two flat steel strips gripping round the post, fixed with side bolts and not through bolts, the idea being that the comparatively flexible arms will adjust themselves to the balance of the longitudinal strains, and if a line breaks on one side the arm will bend round towards the unbroken side, thereby greatly reducing the strain.

Relieving Cross-arm Loading.

In England Mr. Twiss developed a system of screwed up grip fastenings for insulator caps so that under excessive strain the conductor would slip somewhat and thereby relieve it. One of the advantages of the multiple suspension insulator system is that the strains in the different spans take up automatically, and in case of a break the cross-arm loading is greatly relieved.

If we could only get out of the habit of insisting on strength where it is not wanted there would be an opening for the use of bakelised wood instead of steel pins, with corresponding reduction in electrical stresses.

With suspension insulators, owing to the possibilities of side swing the clearances between the conductors and the support have to be made materially greater than that required for electrical purposes, the arms or brackets have to be longer, and as the conductor is below and not above the arm the posts have to be higher; which in wood means a greater proportional increase in cost than with steel or armoured concrete.

The chain of suspension insulators is more expensive than insulators of the pin type, although the former give greater electrical and mechanical security.

To some extent the development of glass insulators has tended towards a revival of pin insulators for voltages within the range of that usable for bulk transmission, and therefore we find glass pin insulators being erected in France for 60 and 80 kV, glass insulators not having taken on so well for suspension as for the pin types.

The Electricity Commissioners' regulations were modified in 1928, to the extent of reducing the arc loading to be allowed for, and therefore the stress per span, and also the minimum height of low tension conductors. This modification has given some relief regarding first cost, although the extra facilities given on the low tension side, which encourage an increased radius of supply from a step-down transformer station, may lead to difficulties regarding voltage drop as loads fill out.

Across the Atlantic in the early days wood cross-arms and wood pins were very usual for overhead line work. The galvanised steel pin is replacing that of wood, although the wood cross-arm, with brace of flat strip, still has considerable vogue. The absence of compulsory earthing and bonding of metal insulator pins, which earthing tends to lower the insulation of the whole line, makes the insulators much more susceptible to arcing over than otherwise, and the fact that oak is comparatively cheap has its influence. A wood cross-arm with a rounded top has become a favourite. In a fitting of the Ohio Brass Co. (see THE ELECTRICIAN, January 25, 1929, page 108), the pin has a cone resting in a saddle which fits the top of the arm, the insulator being an O.B. 45 000 V type. To strengthen the cross-arm a small bolt and washers can be passed through the arm, back to front, clear of the hole made for the pin. The pin top is a conical screw covered with lead. A good wood cross-arm will last many years where climate is not adverse, and it does not require painting.

Suspension Insulators for Terminals.

At home, steel cross-arms of angle or channel section are frequently used, the channel with the pin going through both flanges standing strain better than an angle. It is getting usual in England to use suspension type insulators for terminals. They make a sound job and give a better insulation than shackles.

A pole top of a line in North Wales is seen in Fig. 1. The line itself is of galvanised steel and is arranged with doubled insulators for a road crossing, for 11 000 V. The cross-arm is of angle iron, mushroom-shaped bird guards are fitted, and the earth wire is suspended below. The line was executed by Crompton-Parkinson, Ltd.

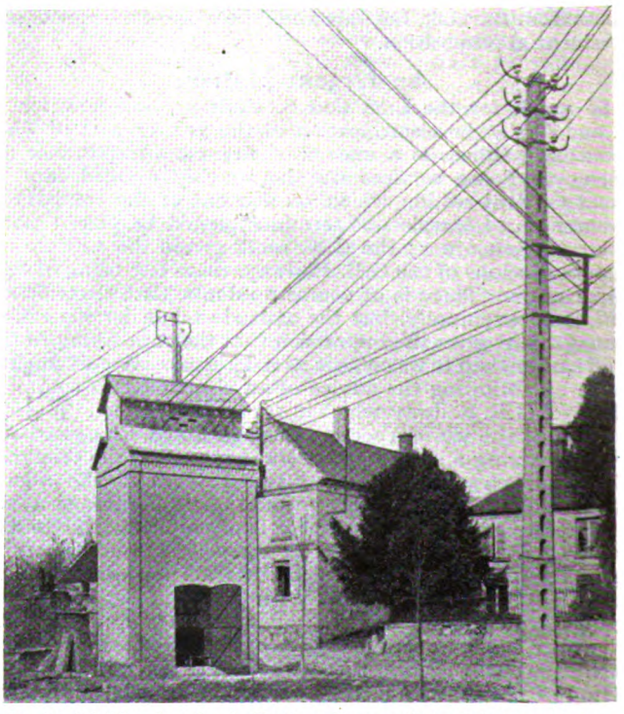

Fig. 2.—A brick sub-station in Northern France with two h.t. lines entering. The post on the right is of armoured concrete, the cross-arms being of the Jacquemard type.

When considering the arrangements of the supports for a three-phase overhead line, one of the first questions to consider is the placing of the conductors relative to one another. From the electrical point of view the equilateral triangle is

Digitized by Google

the best, as it gives a mutual balance without transposition. The conductors can easily be rotated when desirable to minimise interference with postal lines.

The arrangement of two insulators on a level below, and the third at the top of the pole, is convenient from the point of view of minimum pole length, although a horizontal cross-arm is attractive for birds.

The herring-bone arrangement is economical for pole height and is not attractive to birds; it has been used to a material extent in America, and recently in England and France. The staggered swan-neck arrangement was for many years a favourite in France, Germany and Italy; the triangle is retained, and sometimes short bracket arms are used.

Where roadside lines are the rule and spans are kept short, the "flag" arrangement is sometimes used. It is not good from the point of view of balancing, but when the insulators face the road it is easy for a linesman on a motor cycle to see whether any of them have been broken. In New Zealand the cross-arm is placed close to the top of the pole, and the three conductors arranged horizontally, an arrangement which is perhaps more economical than pleasing.

On the Continent, swan-neck stalks are very largely used for pressures up to about 25 000 V. The position of the conductor is about on the level with the hole through the pole. Originally the dip in the neck was in the form of a **U**, but recently the German form, with a down slope, has had some vogue. It gives somewhat more clearance in proportion to its strength and provides no place for birds to sit on. It is made either with bolted ends or with coach screw ends, and is often made out of $\frac{7}{8}$ in. or 1 in. bar. For comparatively light lines the swan-neck system is cheap and apparently satisfactory.

A strain in the direction of the line has not the same tendency to turn the insulator over as with a pin on an arm, an unbalanced stress being taken up by a combination of the outward bending and torsion on the bar forming the swan-neck.

In England, with wood posts, pole-roofs are the rule. In Belgium and Denmark conical metal caps are often used. In America, France and Italy the wood poles are usually pointed; in France the tops are often tarred or painted.

Regarding the fixing of pin insulators, cement or sulphur were at one time largely used; nowadays a screw section is popular abroad. A lead cap to the pin gives a certain amount of plasticity, enabling a better bearing to be taken. As with many other things, even in the cementing of insulators, care must be taken, and troubles are not always due to the cement maker.

For insulators, porcelain was first in the field, and in this connection Messrs. Bullers, Ltd., of Hanley, claim to have been the pioneers in the making of telegraph insulators. Cornish china clay has remarkable properties for such purposes, and some of the transatlantic insulator makers, such as the Ohio Brass Co., buy Cornish china clay by the shipload.

Glass is used very largely in France and Italy, especially for h.t. distribution voltages. In the past there have been troubles owing to the difference in expansion between the steel stalk and the glass, but this has been overcome. In Germany, steatite is being tried. So far, for high voltages, moulded organic insulators have not been successful out of doors.

TIMBER PRESERVATION.*

Why Creosoting is Favoured—Impregnating Processes Compared—Savings on Maintenance Costs—Main Points of Decay.

By CHRISTOPHER WADE, A.M.I.E.E.

CREOSOTING under pressure has been used and found satisfactory in this country since 1838, when Mr. John Bethell obtained his original patent for the injection of hot creosote oil or dead oil of tar into the wood to be preserved in a closed cylinder under pressure. Timber so treated is still in use after thirty years. Examples are in existence after fifty years and more, in a perfect state of preservation.

Inquiries have shown that the General Post Office have had as many as fifty-seven years of useful life out of creosoted wooden telegraph poles, and the London, Midland and Scottish Railway about fifty-eight years, or perhaps longer.

A year or two ago a big power company had every pole of some thousands examined and bored into, after being up about twenty-five years; only about ten were found to be doubtful. I believe that creosoted poles last indefinitely in hot and dry climates—when not attacked by white ants, after the first virulence of the disinfectant has worn off.

In the north of America they use large quantities of creosoted cedar for telegraph and power poles. Also in Australia they use blue gum, creosoted under pressure. And in Southern and Central Europe, also in Spain, they use an inferior redwood.

Many other countries possess creosoting plants. Amongst these are Germany and America, with perhaps the largest output, also Denmark, Norway, France, Finland, Sweden, Portugal, Italy, Austria, Russia, Switzerland, and Holland. We export large quantities of creosoted telegraph poles to South America, Egypt, South Africa, the Sudan, etc.

In Norway, Sweden, and Finland, where our supplies of red fir are obtained, it was unusual until recent years to see creosoted poles; if a pole rotted, it was merely a question of cutting down a neighbouring tree to replace it. But even Sweden, where timber is so cheap, has at last discovered the value of creosoting, and has a travelling plant mounted on railway bogies; in this way creosoting the timber where felled, which is, as a rule, the place where it is required, and so saving the haulage of the timber down to the plant and back again to the forests for erection.

As to creosoting processes, the old full cell, or Bethell, process is practically never used now. The German Ruping process has taken its place. By this the surplus oil is drawn off and the timber is left practically dry to handle.

In this process poles are placed in a cylinder. A vacuum is put on in the first place to extract any moisture, and then compressed air pumped in at a pressure of 60 or 80 lb. per sq. in., which opens up the pores of the wood, and the creosote oil is pumped in on the top of this pressure, up to, say, 150 lb. When this pressure is taken off the compressed air in the cells of the timber expels any surplus oil, leaving in about 5 or 6 lb. per cu. ft.

Whitewoods—such as spruce or larch, etc.—will not absorb creosote, owing to the pores or grains of the wood being closed up, and are otherwise unsuitable; larch, moreover, has a tendency to split and twist.

Penetration cannot be obtained in the heartwood of any wood—even redwood—owing to the cells of the heartwood being sealed up. This fact does not seem to be generally appreciated or understood. But as most decay commences from the outside, this is of little account.

Any preparing, such as arm slots, etc., should be done before creosoting, as otherwise untreated timber may be exposed, so letting in rotting agents, or fungi, which are carried by the wind.

The main point of decay is undoubtedly between wind and water at ground line, where all the three necessary factors of decay are present—namely, moisture, air, and warmth. Some poles have been found hollow owing to the moisture entering at the top and percolating down the poles.

We have indisputable facts as to the length of life of good quality redwood, creosoted under pressure. This has been generally used since its adoption by the English G.P.O., the leading railway and power companies. There may be good points in other processes, but they have not been proved. The properly creosoted wood pole requires no attention or maintenance, as against steel towers and poles, which require constant painting.

Some people suggest using or impregnating inferior woods, or whitewood. I do not think this is at all suitable or feasible, as the cost is practically no less, and the nature and texture of the wood is unsuitable. Also I am told the authorities have no intention of allowing the use of whitewood. By this I do not mean larch in Scotland.

During the recent gales I heard of lines of steel poles uprooted at the foundation, and also doubled over at a point high up below the wires, where painting had apparently stopped on account of danger, and so let corrosion in. On the other hand, I heard of no cases of wood pole lines failing.

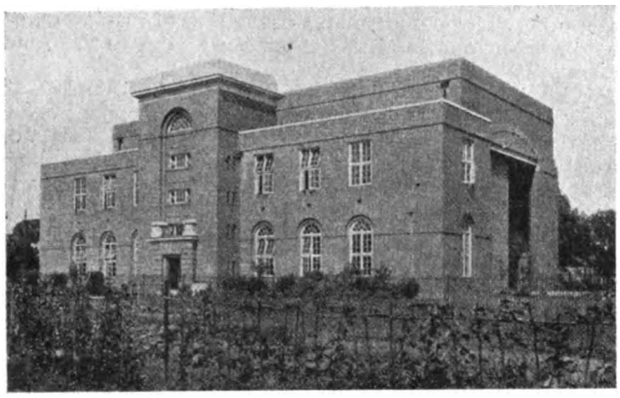
THE NATIONAL PHYSICAL LABORATORY.

Report on Work during 1928—Development of Measuring Apparatus for High-Voltage Work—Re-determination of the Absolute Ohm—Progress in Photometric Problems—Wireless Research Programme.

THE annual report on the work of the National Physical Laboratory for 1928, which has just been published (H.M. Stationery Office: 9s. net), contains, as in previous years, the reports of each of the departments. For the benefit of those who are only interested in the work of particular departments, however, arrangements are being made for the publication of separate sections dealing with physics, electricity, meteorology, engineering, aerodynamics, metallurgy, and units and standards of measurement. Dealing with the work of the Electricity Department, the Executive Committee reports that among the many matters of interest deserving mention in connection with the work of this department, the most conspicuous are the completion of the high-voltage plant, the progress made with the re-determination of the electrical units, and the international agreement and adjustment reached, as a provisional measure, in the photometry of high-efficiency lamps. The staff in the Electrotechnics Division have devoted much time to the development of measuring apparatus for use in the high-voltage work and to the provision of the many items of equipment needed to complete the high-voltage installation. It has been possible to make for firms, as well as for investigatory purposes, breakdown tests on strings of insulators up to the full capacity of the plant, and experimental work has been in progress with a view to improvement in methods of measurement of peak voltage in alternating current circuits, by using, after rectification, the current induced in a conductor by the voltage to be measured. A resistor for measurements up to 150 000 V has been designed and is under construction, as well as a shielded resistor for 40 000 V for use as a potential divider.



Exterior view of the High Voltage Building at the National Physical Laboratory.

Improved Test Methods.

In addition to the high-voltage work, the Electrotechnics Division has effected a number of improvements in the methods ordinarily employed in tests and investigations for industrial firms. A low-range electrostatic voltmeter has been constructed on the same principle as those in use for the range 50 to 150 V. The new instrument gives a scale deflection of 5·5 metres at 50 V, and can be read to one part in a thousand at 10 V.

A set of shielded resistances has been constructed for use in audio-frequency bridge work, ranging from 1 to 50 000 Ω. Air-cooled standard wire resistances for alternating current measurements have been prepared, to replace the water-cooled manganin tubes formerly employed. The resistance for large direct currents has been completed and will probably serve for measurements up to 15 000 A. Some special uses of transformers for measuring purposes have been explored, and the potentiometer electrostatic method for testing voltage transformers has been further tried and found to yield very satisfactory results.

The value of "ohmal" for the construction of standard resistances has been confirmed, and twenty-four such resistances have been under observation. Other resistance materials have been studied.

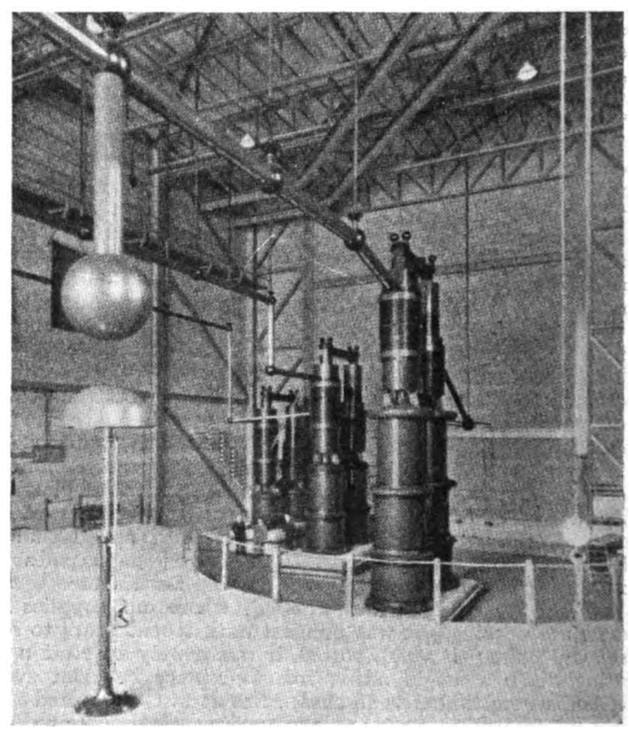
The work on the earthing of electric circuits was brought to an end during the year, and a report has been presented to the Wiring Rules Committee of the Institution of Electrical Engineers. A comprehensive investigation has been made into the effective resistance of lead-covered cables when carrying alternating currents, and will be published by the Institution. Researches on the effects of heating, and on the dielectric losses in cables at high voltages have been in progress for the British Electrical and Allied Industries Research Association.

Electrical Units and Standards.

In the Electrical Measurements Division very satisfactory progress has been made with the work on the electrical units and standards. The Lorenz machine has been put in order for a re-determination of the ohm in absolute measure, and the experiments will shortly be begun. Much has been done also towards the provision of the necessary equipment for the determination of the ohm by the alternating current method devised by A. Campbell. If good agreement is secured between these two methods, knowledge of the value of the absolute ohm will be established on a very satisfactory basis. An inter-comparison of all the standard resistance coils of the laboratory has also been completed, and a study is in progress of the change in resistance with time of newly constructed standards.

The current balance is undergoing reconstruction in an improved form, and it is hoped to reassemble it in the coming year. Measurements showing good agreement with those previously obtained were made with the balance before dismantling it. The results of the work on standard cells, including inter-comparisons with other national laboratories, are regarded as satisfactory.

The account given of an international comparison, between the Bureau of Standards and the National Physical Laboratory,



View inside the High Voltage Laboratory at the N.P.L.

of measurements on a sub-divided mica condenser sent to Teddington from the Bureau, will be found of interest. The results show good agreement in power factor, but a definite difference in the capacity measurements; experiments are proceeding with a view to the explanation of the latter.

A number of additions to the equipment for magnetic measurements have been provided to extend the range within which measurements of hysteresis loops and of total loss can be made.

Digitized by Google

Under the heading of research are included some nine investigations of varied interest. The vertical force magnetometer described in previous Reports has been set up at the Abinger magnetic observatory. The measurements have shown variations, due, it is believed, to changes in the temperature of the hut in which the magnetometer is housed, which have amounted to several parts in 10 000 in six months. This matter is receiving attention. The work on the dielectric constant of benzene, mentioned last year, has been completed. The method devised for the comparative measurement of input and output voltages on an amplifying system has been brought into operation, and found to give satisfactory results.

A considerable amount of work relating to radio standards has been accomplished for the Radio Research Board. A critical résumé of the literature on piezo-electric crystals has been prepared, as well as an account of a mathematical examination into the relationship between the piezo-electric and the dynamical properties of resonators.* The interferometer method of examination of vibrating crystal plates has been developed with much skill, and has led to results of great interest.

Some modifications have been introduced into the programme of standard wave transmissions by the Laboratory, and arrangements are being made for the transmission of waves suitable for giving a means of short wave standardisation. An interesting series of frequency measurements on short wave stations in all parts of the world was made for the Radio Research Board, at the request of the Post Office and of Marconi's Wireless Telegraph Co., Ltd., the expense of the work being met by a contribution made to the Board by the company. The results of measurements made on Rocky Point, Long Island, N.Y., by the National Physical Laboratory and a number of other laboratories, showed agreement to about one part in 100 000.

The account of the analysis of losses in an air condenser will be found of much interest. Progress has been made with the work for the Physics Co-ordinating Research Board on alloys for compass correctors. Work on dielectrics has been continued for the British Electrical and Allied Industries Research Association, and a programme of work on a considerably increased scale has been prepared at the request of the Association, with a view to placing the work on a suitable footing to secure material progress, provided the Association is able to furnish the necessary funds.

Illumination Research.

The Photometry Division has a considerable programme of work in hand for the Illumination Research Committee of the Department, and the Report contains this year an account of a number of important investigations which have reached a definite stage of progress. The main research into the effect of glare on the brightness difference threshold, referred to in previous Reports, has been completed, and a paper on the results has been presented to the Royal Society.† An account of some of the work was communicated this year to the International Commission on Illumination. A series of tests for estimating glare and visibility in lighted streets was organised in July, in connection with the Sheffield meeting of the Association of Public Lighting Engineers, and has yielded interesting information. The delegates willingly gave their services as observers, and ten street-lighting installations were examined. A full report on the work has been submitted to the Committee.

The observations on skylight illumination have been continued, and the Usher Institute of Public Health in Edinburgh is co-operating by making measurements in that city. The investigation into various problems of room lighting has made good progress; this includes the study of illumination from light wells, measurements of daylight factor in deep rooms, transmission of window glasses when clean and after exposure, and other work. A description is given of a new design of illumination photometer.

The study of methods of photo-electric photometry has been continued, and a considerable advance has been made in establishing the use of the photo-electric cell on a reliable basis. For work of the highest precision the original photometer, described to the Optical Society last year,* consisting of a bridge arrangement of two photo-electric cells used with a Compton electrometer, continues to give the best results. Modifications have been made to overcome fatigue effects in the cells. The photo-electric cells is also employed for obtaining continuous daylight records.

Photometric Problems.

Work on heterochromatic photometry has been actively continued, in relation to the problems raised by the use of lamps of different colour temperatures. In particular, the use of a method of flicker photometry has been explored, which depends on the determination of what is called the Y/B (yellow/blue) ratio for different observers. Once this ratio has been obtained for any observer, it would appear from the experiments of Ives and others that the results obtained by the observer in the presence of a given colour difference can be reduced to those for the normal eye. Experiments are also in progress to determine the validity of the flicker photometer for use with large colour differences.

Papers have been published on the inter-reflection of radiation, where reflection and emission obey the cosine law;† the results are of much interest in relation to black-body radiators.

Work on the programme arranged at Bellagio in 1827 for securing international agreement on a method of heterochromatic photometry has been continued. Four blue glasses have been received from the Reichsanstalt, and their transmissions have been determined for light of colour temperatures 2 080 deg. K. and 2 360 deg. K. Calculations based on spectrophotometric measurements have also been made, and measurements with a flicker photometer are proceeding.

Intercomparison with the Reichsanstalt of measurements on six gasfilled lamps operated at 13 lumens per watt gave a value of 0.847 for the mean horizontal Hefner candle in terms of the mean horizontal International candle, as compared with the value 0·900 defined in 1909, from measurements with carbon lamps. The value of the mean spherical Hefner candle was found to be 0·850 in terms of the mean spherical International candle. Measurements on tungsten vacuum lamps gave the mean horizontal Hefner candle-power as 0·871 of the mean horizontal International candle-power, in close agreement with the result obtained in 1926, the value found for the ratio of the mean spherical Hefner candle to the mean spherical International candle was 0·878, indicating a difference of about 0·8% between the determinations of mean spherical candle-power at the two laboratories.

Intercomparisons of candle-power measurements have also been made with the Laboratoire Central d'Électricité, and have revealed matters requiring further investigation. A considerable amount of work has been done on a set of gas-filled lamps for use as standards of directional candle-power. The work on problems arising in the use of photometric integrators has also been continued.

In the Wireless Division, good progress has been made with the programme approved by the Radio Research Board. A number of papers have been published during the year, giving the results of researches completed. An interesting series of experiments has been carried out on antenna systems for beam transmission. In addition to study of the conditions affecting the "sharpness of directivity" of the system, experiments have been made in an aeroplane to check the calculations of the polar radiation diagrams of antenna systems in a vertical plane. Help has been given by the Air Ministry by the loan of an aeroplane for this work. Differences have been found from the theoretical energy distribution, and the work is being continued with a view to obtaining an explanation of these.

For research on wave-lengths below 25 m., a special oscillator, in which two 250 W valves are used, has been installed at Slough, and a portable loop receiver has been constructed for use at Teddington. It is possible to hold the note in this constant to about 100 cycles per sec., corresponding, for 7 m. wave-length, to a constancy of 1 in 100 000. A portable direction-finder for use on wave-lengths between 5 and 10 m. has also been provided.

In the continuation of the research on directional wireless, attention has been directed mainly to elucidation of the causes of error in the performance of a rotating loop beacon, and the development of a rotating transmitter free from night errors.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"The Factor of Safety of Overhead Lines."

(To The Editor.)

Sir,—In Mr. Taylor's letter of March 27th, on the above subject, he refers at length to reinforced concrete poles. To this part of his letter I do not feel called upon to reply, since the question was not raised in my article.

So far as the remainder is concerned, we do not appear to be in agreement; or, rather, Mr. Taylor has mistaken my meaning. I believe it to be an established fact that pole foundations are usually weaker than the poles themselves. This is obviously absurd—as Mr. Taylor agrees—and since no trouble has ensued, the inference I draw is that generally the poles were too strong.

The last two paragraphs of Mr. Taylor's letter I cannot properly understand, but I gather that he complains of two somewhat facetious paragraphs in my conclusions. But these two imply a moral, though they do not explicitly state it, namely—since I personally should err heavily on the side of safety were I drafting regulations for the protection of the public, and would require much more than I could justify on purely technical grounds, I presume the Electricity Commissioners have shown the same human weakness—but yet I hope they will be courageous, and make future regulations no more severe than investigation shows to be absolutely necessary.—I am, etc.,

W. Fordham Cooper.

London, N.8,
April 18th.

Battersea: A Suggestion.

[to the Editor.]

Sir,—With regard to the Battersea power station, I would be glad if you would allow me to make a suggestion, which, I think, is of the greatest interest and importance to the whole of the electrical industries.

It is, of course, familiar knowledge that the chief point in connection with all the uproar against Battersea is the emission of sulphur in the chimney gases and the consequent corrosive effect on the surrounding buildings, especially when it is remembered that this station is in the heart of one of the most populous centres of London, and is to burn, I understand, about 2 000 tons of coal per 24 hours.

On the very moderate figure of 1½% sulphur, this will correspond to 30 tons of sulphur per 24 hours, which is equivalent to 90 tons of sulphuric acid. Incidentally, of course, the sulphur is more or less completely burned, partly to sulphur dioxide (SO_2), but probably, also, to a considerable extent, sulphuric acid, that is, SO_3, (which unites with the moisture in the air) is formed as well; and, in any case, sulphur dioxide alone, especially in conjunction with moisture, is strongly corrosive.

In spite of the enormous advances that have been made in the technique of steam generation during the past dozen years or so, no one in the world has yet attempted to tackle the question of the elimination of sulphur in flue gases, and I want to make the suggestion that the whole of the electricity authorities in London should unite together, appoint a thoroughly representative committee of experts, and then carry out, at joint expense, research and large-scale investigations on the whole subject, using, for example, one of the London power stations for the purpose. Sooner or later this problem will have to be tackled, and, in my opinion, it is the electrical industries who should do it, especially as they lead the way in the supply of such an efficient, clean, and healthy method of heating and lighting as electricity.

I want to make it quite clear that, of course, I am a militant pro-electricity man, and to emphasise that certainly over 80% of the 1 400 000 000 tons of coal produced in the world per annum is burnt in the raw state with the discharge of sulphur to the atmosphere, so that, collectively, the power station is a minor offender.

The subject is, naturally, extremely complicated, and it is for this reason that detailed research work is necessary. For example, it might be possible to wash the chimney gases with forced sprays of water, while, further, the colliery industry and electricity stations might unite together and adopt special methods of cleaning coal so as to reduce the sulphur content in many cases to a considerable extent. Even this matter, however, is difficult, because, of course, many coals have a considerable proportion of organic sulphur, and it is not outside the realms of possibility that highly efficient methods of washing coal might actually increase the percentage of sulphur, although, generally, the reverse would be the case.

Then one could consider the possibility of combined low-temperature carbonisation and total gasification, with consumption of part of the gas under boilers after purification of the much smaller volume involved as compared with the total chimney gases. Again, various catalytic methods might be discovered of treating chimney gases, and, for example, the latest principles adopted at the Trenton Channel station of filtration through bags, to reduce emission of dust and grit, might conceivably be combined with some catalyst which would separate the sulphur in the solid condition, both from SO_2 and SO_3. The main point is, however, that complete scientific investigation on the whole question is urgently required, and, in my opinion, this should be undertaken by the electricity industry itself, and—above all—without the interference of the politician and the Government official.—I am, etc.,

David Brownlie.

Ealing, W.5,
April 20th.

"The Electric Sign Load."

[To the Editor.]

Sir,—Under the above heading your correspondent "Elecsine," in your issue of April 12th, assumes that the total load on Selfridges' gigantic sign was 900 kW. Your correspondent assumes that all the lamps were 30 W, but this is not so, as about 30 000 of the lamps were only 7 W and 14 V, wired in parallel-series for a 240 V circuit. The only lamps of 30 W were those employed in the four letters constituting the dates. The total load for this exterior lighting was, approximately 250 kW, whilst, for the decorative lighting inside, another 84 kW was required.

We would mention that the whole of the plant has been dismantled and is now in our stores awaiting sale or hire.—I am, etc.,

For Implitico, Ltd.,
W. R. Lambert,
Director.

London, S.E.1,
April 19th.

"Educating the Public."

[To the Editor.]

Sir,—Many contractors will, I feel sure, feel grateful to "Regtract" for drawing attention to the seeming lack of co-operation between the E.C.A. and the National Register of Electrical Installation Contractors. If the progress of the Register has been slow I submit that one of the chief causes has been the hyper-critical attitude of the E.C.A., and its unreasonable demand—which I understand is now abandoned—for E.C.A. representation on every Local Advisory Committee, irrespective of whether the E.C.A. nominee was registered or not. The special committee, to which reference is made in the "Electrical Contractor," is in my view a direct reflection on the propaganda work which has been carried out by the National Register within the last few months. If the Association is not satisfied with the extent of this work why does it not subscribe a definite sum for use by the Register in the prosecution of its publicity campaign?

As I see it, the E.C.A. appears to regard the Register as a competitor, instead of a potent force and ally in building up the public prestige of reputable electrical installation contractors. A more helpful attitude towards the Register would do more good than any number of E.C.A. special committees.—I am, etc.,

"Regicon."

NEWS IN BRIEF.

May Meeting of Overhead Lines' Association—Electrical Trade Wages—Indian Tariffs and Electrolytic Copper—N.E. Coast Lighting Service Bureau Moves Its Office.

THE electrical installation at the Brighton Corporation mental hospital is to be extended at a cost of £1 100.

The date of the meeting of the Overhead Lines Association for next month has been altered to May 15th, when Lt.-Col. W. A. Vignoles will present "Getting Consumers in Rural Areas" at 5.30 p.m., at the Institution of Electrical Engineers.

All northern parts of Manchester are now equipped with police telephone boxes.

Electrically operated traffic signals wereput into operationin the centre ofLiverpoollastweek.

York Corporation is to establish automatic road signal apparatus at five additional points in the city.

Plymouth Hospital Committee is to complete the electric wiring of the mental hospital, at the estimated cost of £515.

The Metropolitan Asylums Board is to install, at a cost of £1 210, an internal telephone system at the Grove Hospital, Camberwell.

The Indian Tariff Board proposes that the import duty of 15% on electrolytic copper rod be removed, and that a duty of 5% be imposed on rubber insulated electric wires and cables, other than those specified in Tariff No. 90A, which are duty free.

Arrangements have been made by the North Midland area E.D.A., for the second Area Sales Conference to be held at the Royal Victoria Station Hotel, Sheffield, on April 30th, at 7.30 p.m., when Mr. R. A. S. Thwaites, of the Yorkshire Electric Power Co. will speak on "Selling Electricity for Industrial Purposes." The chairman will be Mr. S. E. Fedden.

Sheffield City Council is inviting applications for the position of general manager and engineer of its electricity supply department.

The Manchester Medical Officer of Health refuses to approve of the use of unscreened ultra violet ray lamps in the public baths unless the treatment is under the supervision of qualified medical officers.

A special course of six lectures on thermionic valves will be given at the Polytechnic School of Electrical Engineering, London, by Mr. W. H. Date, on Wednesdays, commencing May 8th, from 6.30 to 8.30 p.m.

The annual report of the Ontario Hydro-Electric Power Commission states, the revenue of the Commission for the twelve months ended October 31st last was $24 287 296. Expenditures were $23 346 633.

Rotherham Corporation has instructed the architects to submit schemes of heating the new technical college and school of art by low pressure hot water heating apparatus, by using (*a*) solid fuel boilers, and (*b*) gas fired boilers, and (*c*) by electricity.

Official statistics show that on December 31st, 1928, the British telephone system comprised 1 759 666 telephones, an increase of 125 864 over the previous year. During five years there has been a net addition of 611 571 telephones, or over 50%.

Emergency calls are to be provided for in all multi-coin telephone call boxes connected with manual exchanges by means of a press button device which operates a flashing priority signal in the exchange. Automatic telephones do not need the device.

The Borough Electrical Engineer of Tynemouth has recommended that an electric oven for instruction purposes be lent to the Municipal High School free of charge. The question has been raised whether cooking instruction is given at other schools in the borough. The Chairman, Deputy Chairman, and the Electrical Engineer are to make inquiries.

St. Helens Corporation requires an electrical engineer and manager of its electricity undertaking.

Wakefield City Electrical Engineer is to proceed with the conversion of further street lamps from gas to electricity in Westgate.

Glasgow Electricity Department is to carry out a modified scheme of electric lighting and heating at the Shieldhall Hospital, at a cost of £1 505.

London County Council has refused an application for a special subscription of £100 to the British Electrical and Allied Industries Research Association towards the cost of investigating the problem of deeply buried high power electric cables.

The North East Coast Lighting Service Bureau premises will be closed on April 30th, after which its activities will be transferred to the stand of the Electrical Lamp Manufacturers' Association, at the North East Coast Exhibition, which will open on May 14th.

The annual report of the West Yorkshire Telegraph and Telephone Advisory Committee shows that the number of stations in the district at December 31st. 1928, was 65 540, an increase of 2 975. The number of trunk calls during 1928 was 5 859 892, and local and trunk calls numbered 39 782 024.

Manchester Electricity Department received orders in February last for 89 hired cookers, and 31 were connected, making a total of 5 112.

At the general meeting of the North-Eastern Centre, Tees Side Sub-Centre of the I.E.E. at Middlesbrough on April 17th, Mr. J. M. Gibson was elected chairman for the next session, and Messrs. S. N. Warren and D. M. Buist will be vice-chairmen. The hon. secretary is Mr. D. B. Hogg. Mr. A. P. Hill, of the British Thomson-Houston Co., read a paper on "Valve Rectifiers."

A dipper dredge, driven by a 1 100 H.P. Diesel electric generator, and intended for use in connection with the straightening of the Chicago river, has been launched by the Monitowoc (Wis.) Shipbuilding Corporation. The main power unit consists of a two-cycle Diesel engine, directly connected to four generators on a single shaft, and supplying current to the main motors, while auxiliary power is supplied by a 120 H.P. two-cycle Diesel engine connected to a 75 kW generator. There are 28 motors in all.

Following the decision of the London branch of the National Federated Electrical Association on March 6th, it has now been agreed that the rate for journeymen in the London area be increased by 5%, such increase to be based on the rate fixed in accordance with the national standardised wages agreement and to remain in operation for six months. The new rate will therefore be 1s. 10¾d. per hour, against the existing rate of 1s. 9¾d., and the increase will take effect on the first pay day in May for the pay period covered by that pay day. The rate for mates will be increased proportionately—*i.e.*, from 1s. 5½d. per hour to 1s. 6¼d. per hour.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *of April 26th, 1879 :—*

The insulation-resistance of the cable between India and Ceylon was found, after twelve years' use, to be 2 550 megohms, against an original figure of 7 000 megohms.

The Postal Telegraph Department had in use 1 650 bichromate, 2 450 U.K., 12 750 Myirhead, 500 ordinary Daniell, and 500 Leclanché batteries.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *for April 29th, 1904, recorded that :—*

Mr. S. E. Britton, burgh electrical engineer at Motherwell, was appointed borough electrical engineer at Chester.

Following the grant of an injunction against St. Pancras Borough Council for vibration nuisance at its power station, a campaign was initiated to secure the repeal of provisions for action against electricity undertakings for nuisance and damage.

* * *

TEN years ago it was reported in THE ELECTRICIAN *dated April 25th, 1919, that :—*

The successful use of electrically-heated quilts in hospitals was reported from Wigan.

The Electric Lamp Manufacturers' Association was formed, with registered offices at 46, Queen Victoria Street, London.

Mr. W. W. Lackie, then chief engineer and manager of Glasgow Corporation Electricity Department, in a lecture, expressed the opinion that it would be impracticable and uneconomical to have generation and main transmission under one authority, while the distribution was left to be carried on by existing local authorities.

Digitized by Google

PERSONAL.

MR. E. Kilburn Scott is prospective Liberal candidate for South Leeds.

Swindon Town Council has appointed Mr. P. M. Chivers as chemist to the electricity department.

Sir James Devonshire has been appointed chairman of Edmundson's Electricity Corporation, Ltd.

Newry U.D.C. has appointed Mr. W. J. Ellison, as senior charge engineer; and Messrs. E. Hillen and R. Porter, Newry, as second engineers.

Mr. C. D. Cuppleditch, who, for some time, has been designer to Messrs. Joseph Booth Bros., Leeds, has accepted the position of manager with Electromobile, Ltd.

Estate of the gross value of £1 487 was left by the late Mr. William Richard Spaven, for 24 years manager of Portsmouth tramways and formerly Leeds traffic manager.

Sir Oliver Lodge has written a foreword for a forthcoming London exhibition of water colours of Italian harbours and hill towns. He confesses, however, that he would never make an artist.

Mr. W. Bolton Shaw, who has carried on his consulting practice at 25, Market Street, Manchester, for the last eighteen years, has removed to 1, New Brown Street, where he will continue in practice.

Mr. William Thom, late general manager of the Potteries Electric Traction Co., has been presented by the staff and employees with a compactum wardrobe. Mr. Thom has become a director of the company.

We are pleased to learn that Mr. A. Brammer, general secretary of the Association of Supervising Electrical Engineers, is recovering from his recent illness and hopes to resume his duties almost immediately.

Mr. J. H. Thomas has relinquished his position as assistant manager of the Manchester Branch of the General Electric Co., Ltd., and has taken up a position as general sales manager to A. C. Cossor, Ltd.

The marriage of Mr. W. T. Gibson, who is engaged with the International Standard Electric Corporation of Paris, and Miss Kathleen Mary Griffin, was solemnised at St. James's Church, Northampton, on April 18th.

Mr. R. Birkett, borough electrical engineer at Southend-on-Sea, has been given two months' leave of absence in consequence of ill-health, and Mr. A. C. Johnson has been appointed acting borough electrical engineer during his absence.

Mr. F. Rowlinson, at present publicity manager to Mather and Platt, Ltd., Manchester, is shortly to take over the establishment of a publicity department for the United Steel Companies, Ltd., Sheffield, the "vertical" group controlling the merger of steel and allied industrial firms.

The marriage of Mr. H. G. Finchett, assistant engineer and manager of the Oswestry Electric Light and Power Co., Ltd., to Miss D. E. Charles, was solemnised at Oswestry Parish Church on April 16th. Mr. Finchett was presented by the staff and employees of the company with a canteen of cutlery and a case of fish knives and forks.

The short leet for the post of manager of the Aberdeen Corporation Tramways has been reduced to the following three names, which will be submitted to the Town Council:—Mr. William W. Clark, engineer and manager, Nottingham and Derby Traction Co. and Midland General Omnibus Co.; Mr. James L. Gunn, manager, Greenock and Port Glasgow Tramways; Mr. H. H. Lancaster, traffic manager, Blackpool Corporation Tramways.

Replying to the Blackpool Tramways and Electricity Committee, by whom they had been invited to hold their next annual conference at Blackpool, the Municipal Tramways and Transport Association stated that in due course Mr. Charles Furness would be elected president of the Association, and it is the opinion of the Council that the Association ought to meet in Blackpool during the year of Mr. Furness's presidency. The 1929 conference will be held at Yarmouth.

Obituary.

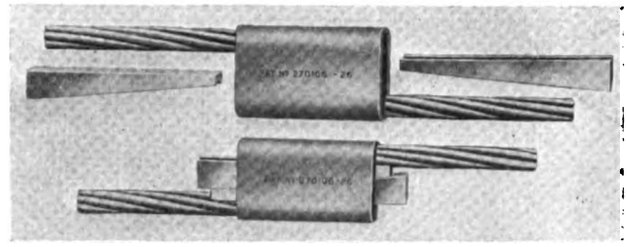
MR. EDWARD GURNEY BUXTON, at Norwich on April 19th, He was a director of the Anchor Cable Co., and of Callender's Cable and Construction Co.

MR. E. HUDSON, on April 16th, secretary of the Oswestry Electric Lighting and Power Co., Ltd. Mr. Hudson had been associated with the company since its inception in 1894 and had been secretary since 1913.

NEW JUMPER CONNECTOR.

Mechanical Connector for Indoor or Outdoor Jointing.

ALTHOUGH designed more particularly for overhead lines, a mechanical jumper connector, introduced by W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1, is intended for use either indoors or outdoors



Illustrating the new connector of W. T. Henley's Telegraph Works Co.

wherever two free ends of conductors—copper rod, busbars, or the jumper loops of overhead lines at angle and junction poles—have to be jointed. The outstanding advantages claimed for the connector are cheapness, efficiency and lightness in weight. The connector consists of three parts, a seamless, parallel sided copper sleeve containing two gun-metal wedges grooved to accommodate the conductors. The wedges fit tightly inside the sleeve, and during transit or handling will not, it is stated, come out of position. Wires of different diameter can be accommodated together in the same connector. The illustration shows how the connector is used. The free ends of the conductor are inserted into the sleeve over the small ends of the grooved wedges, which are then driven into position. During this operation there is no necessity to take the wedges out of the sleeve. It is recommended that a coat of bitumastic paint should be applied when the joint is made. There are no iron or steel parts to corrode and no bolts or screws of any kind. In a recent test on a connector for a 0·10 sq. in. conductor the increase in resistance of the conductor, directly due to the joint, was, it is claimed, less than 6 microhms. After further being subjected to a tensile test, the pull-out load of which was 670 lb., the connector was said to be in no way damaged and could have been immediately put into service. The types, together with the range of cable diameters, are:—Type 1, 0·16 in. to 0·232 in.; type 2, 0·246 in. to 0·324 in.; type 3, 0·347 in. to 0·415 in.; type 4, 0·448 in. to 0·504 in.

INDIVIDUALIST LUNCHEON.

Views on the Spirit of Adventure and the Modern Youth.

AT the Individualist Luncheon held at the Hotel Cecil, London, on April 17th, an address was given by Mr. H. Gordon Selfridge on "Why not more spirit of adventure?" in which he stated that the spirit of adventure, if properly encouraged in the young men of this country, could and would build into their lives the ability to overcome obstacles. In the newer countries young men rarely remained in the town in which they were born. When they left home they did so almost always with the goal of success steadily in mind. When a young man in America or Canada applied for a post he associated with it the colloquial query, "What is the chance to work up?" and a favourable reply to this was even more considered than the immediate wage. This spirit should become part of the plan of every young man in England. Adventure led to leadership and the real leader must prove himself capable of imagination, energy, strength of purpose, constructive ability, of knowledge of men and of the world. In all matters of adventure, business, official, political or what not, the principles were the same. In all control or governmental management the twentieth century man looked for and hoped for the least possible interference with his natural inclinations. Civilisation necessitated certain restrictions. Wise control enforced these and gave safety to life, health and property. Those elected or appointed to positions of authority too often wanted to do all the thinking, and again too often, the youth let them do that thinking so completely that he, the youth, ceased to think. This did not lead to individuality or personality. Paternalism was bad. Too much protection was not good, and tended to stunt growth of self-dependence.

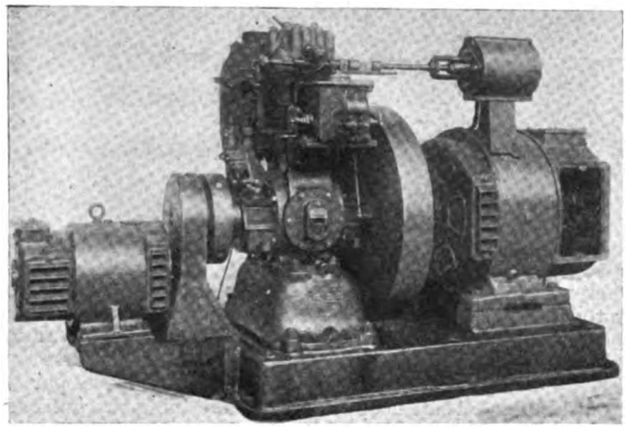
COUNTRY HOUSE LIGHTING.

New 5 kW Plant for Domestic and Other Lighting.

A NEW automatically operated 5 kW electric lighting plant with an 8 H.P. surface ignition oil engine has just been introduced by PETTERS, LTD., of Yeovil. The plant will be exhibited for the first time at the N.E. Coast Exhibition, which opens next



The new 5 kW plant of Petters, Ltd.

month, but, for the benefit of readers interested in equipments suitable for country house lighting, the following are advance particulars.

The plant consists of a type S surface ignition oil engine direct-coupled to a dynamo. A special starting motor is provided, driving the engine crankshaft through reduction gearing, and the whole is carried on a heavy cast iron bedplate. The heat for the ignition of the first charges in the cylinder is provided by means of an electric heating plug, which provides ignition until the vaporiser in the cylinder head has attained a sufficient temperature to carry on ignition automatically. A feature of this starting arrangement is that a rotatable sprayer nozzle is fitted, which injects the fuel in a spray which is directed on the coils of the electric heating plug for starting. When the combustion chamber has become heated after a few moments running, the nozzle is rotated, and the oil spray is directed on to the hot surface of the vaporiser. The rotation of this nozzle is effected automatically by electrical means. A large solenoid is arranged to rotate the sprayer through the medium of a rack and pinion.

LEGAL INTELLIGENCE.

Petition for Liquidation of R.I. and Varley, Ltd., Dismissed by Consent.

IN the Companies Winding-Up Court on Monday, Mr. Justice Maugham heard the petition of Oliver Pell Control, Ltd., electrical engineers, of Commercial Place, Woolwich, and Mr. J. M. Griffiths Rees, for an order for the compulsory liquidation of R.I. and Varley, Ltd., of Kingsway House, London, W.C., a company which acts as selling agents for the wireless and other products of Oliver Pell Control, Ltd., and Radio Instruments, Ltd.

Mr. F. K. Archer, K.C., for the petitioners, said Oliver Pell Control, Ltd., and Radio Instruments, Ltd., had equal holdings in R.I. and Varley, Ltd., and acute differences had arisen between Mr. Joseph and Mr. Rees, representing Radio Instruments, Ltd., and Oliver Pell Control, Ltd., respectively, on the board of the respondent company.

After hearing further evidence, the parties came to an agreement by which it was arranged that there should be a voluntary liquidation, the petition being by consent dismissed.

Power Company Sells Out.

In the Chancery Division on Monday, Mr. Justice Maugham sanctioned an alteration in the objects of the Atlas Light and Power Co., Ltd.

Mr. Cecil Turner, for the company, said it was formed to carry on water works, power stations, tramway and railway undertakings in Argentina. It had recently sold all its investments in that country for £8 500 000, and, owing to the restricted character of its investment powers, the company would have difficulty in using this large sum to advantage. It therefore desired to alter its objects so as to take the general powers of a trust investment company.

IN PARLIAMENT.

London Passenger Traffic Bills Again Before House of Commons Select Committee.

CONSIDERATION of the Bills promoted by the Underground Group and London County Council to authorise a scheme of co-ordination and co-operation of the passenger carrying services in the London area was resumed by a House of Commons Committee last week. Sir Lynden Macassey, K.C., handed in a copy of the companies' Bill amended as directed by the Committee. There was, he said, a clause in the L.C.C. Bill authorising, among other things, local authorities to make representations to the Minister with respect to the need for development or extension of the associated undertaking in their areas.

Lord Ashfield, cross examined, said as a result of the pooling agreement the London General Omnibus Co. paid a substantial sum to the Metropolitan Electric Tramways. The latter was improving its position, and was now very close to meeting its obligations. The Underground Group had a controlling interest in the M.E.T. There was no limit to the amount which could be spent on the traffic undertakings of London. On the proposed Tramway Board, municipal and company undertakings would be represented.

Mr. Arthur Moon, K.C., for East and West Ham, said those boroughs agreed that a scheme should be evolved for the co-ordination of London's traffic, but they did not consider the proposed scheme the best means of dealing with the problem.

Mr. Arthur Collins, financial expert, who gave evidence on behalf of eight Metropolitan boroughs opposing the Bills, said the L.C.C. now controlled 70 per cent. of the tramway traffic in London. A combination between them and the Underground companies would enable them to make it difficult for other traction authorities to survive. The common fund to be established under the Bill would be weaker for the purpose of raising capital for new developments than the present common fund of the Underground Group, as they were taking in concerns which made a loss. A working arrangement without the complication of the common fund was all that was needed. The L.C.C. case would not meet the combine case. He would like to see any such wide development as the Tramway Board brought there for discussion. It ought to be open to a local authority to take any request for extension or development of facilities before a tribunal sitting for that purpose.

Ald. F. C. Ross Douglas (Battersea) said there was no guarantee in the Bills against the present cheap tram fares being increased or the present facilities being changed.

Mr. Rowland Harker, K.C., for Middlesex County Council, (the lessors of the Metropolitan Electric Tramways), asked that the Council should be allowed to take part in the negotiations between the L.C.C. and the Underground Group before the first agreement was made, or to have an opportunity of criticising it.

Sir Lynden Macassey (for the Underground Group) said they had offered that the owners of tramways on the area should be asked to participate in the negotiations.

Mr. R. S. Cripps, K.C. (for certain Metropolitan boroughs) said the Bills did not really deal with the problem of co-ordinating traffic, but only laid down a wide principle of a financial merger, and that the scheme indicated by the Bills was not workable.

Mr. H. Macmillan, K.C., said it had been agreed with the promoters to ask for the insertion of a clause giving the right to local authorities owning tramways in or partly in the London area to be a party to an agreement for common management and a common fund, and that the promoters should supply to such local authorities such information as they may require upon the terms of any such agreement.

Mr. Harker submitted that the Bill should be rejected unless provision was inserted to enable Middlesex County Council to appear before an independent tribunal.

Sir Lynden Macassey, in his final address, said this was the only scheme in the field for the co-ordination of traffic. The promoters were prepared to insert a provision that the application of any surplus of the common fund should be subject to the approval of the Minister of Transport.

Mr. Evan Charteris, K.C., for London County Council, said the Council was going to sacrifice, to a certain extent, a control over the transport of 700 million passengers and obtain control over 2 000 million.

On Monday, the Committee found the preambles of both Bills approved, and, after some adjustments of clauses had been made, the Bills were reported to the House.

BUSINESS ITEMS.

MR. J. SHIRLEY, wireless engineer, has opened new showrooms at 130, Cowley Road, Oxford.

LEO SUNDERLAND AND CO., LTD., have removed to 58, Buckingham Palace Road, London, S.W.1.

J. O. CALLAGHAN AND CO., have transferred their business from Queen Street to MacCurtain Street, Cork.

The Dublin offices of W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., have been removed to 11, Fownes Street.

A confidential memorandum on the market for wireless apparatus in Genoa has been prepared by the Department of Overseas Trade. Reference, B.X. 5242.

The address of the London office of the MULLARD WIRELESS SERVICE CO., LTD., has been changed to Mullard House, Charing Cross Road, London, W.C.2. The Birmingham offices of the company are now at 36–37, Dale End.

The exhibits of BROOKHIRST SWITCHGEAR, LTD., at the Printing Exhibition, which concluded at Olympia, London, on Thursday, included in addition to the exhibit proper, some 45 panels controlling presses in other parts of the show.

A. P. LUNDBERG AND SONS, LTD., 477/489, Liverpool Road, London, N.7, advise us that Lundberg's dual control switching was used in conjunction with the magnetos fitted on Major Segrave's motor boat, "Miss England," at the time of the speed test in America.

A five-days exhibition was held in the Town Hall, Oldbury, last week, by the SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO. An electrically operated sewing machine was shown by the Singer Sewing Machine Co. and other exhibitors were the Revo Electric Co., Ltd., and Messrs. W. and T. Avery, Ltd. See page 511.

The METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester, has received a letter from Mr. R. F. Dixon, engineer and manager of Mansfield and District Tramways, Ltd., which points out, that when overhauling one of the tramcars for the undertaking and taking down the field coils for re-insulation, the original shop ticket was discovered, the car having been running continuously for 24 years. The insulation appeared to be in good order, and the coils are being put back for further service.

An order has been placed with the MARCONI'S WIRELESS TELEGRAPH, CO., LTD., by the Société Belge Radioelectrique, on behalf of the Belgian Government, for a short-wave telegraph-telephone transmitter which will be used for communication between Belgium and the Belgian Congo and Belgium and South America. Two short-wave receivers, similar to those used in the Marconi "beam" stations, have also been ordered.

New showrooms and offices have been opened by the SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO., at 373, High Street, Smethwick. The new premises comprise spacious showrooms, a model demonstration kitchen, store rooms, and offices furnished in an up-to-date manner. The architectural work was done by the company's own building department, the electrical wiring was by WALKER AND CO., Smethwick, and the tubular electric heating system by MESSRS. YOUNG, OSMOND AND YOUNG. See page 511.

Three further high power rectifiers for the New South Wales Government Railways and Tramways, Sydney, have been ordered from BRITISH BROWN BOVERI, LTD., Trafalgar House, Waterloo Place, London, S.W.1. Each of these equipments is for an output of 1 500 kW at 1 500 V d.c., two being for an extension of the Granville sub-station, and the third for the extension of the Cabramatta sub-station (formerly Cabravale). All three equipments will be arranged for completely automatic control, similar to that provided for the ten previous equipments. When the three new sets are at work, this railway company will have a total of fifteen 1 500 kW plants in operation. As a matter of further interest it may be mentioned that the total capacity of Brown-Boveri high power rectifiers installed or on order is now nearing 1 000 000 kW.

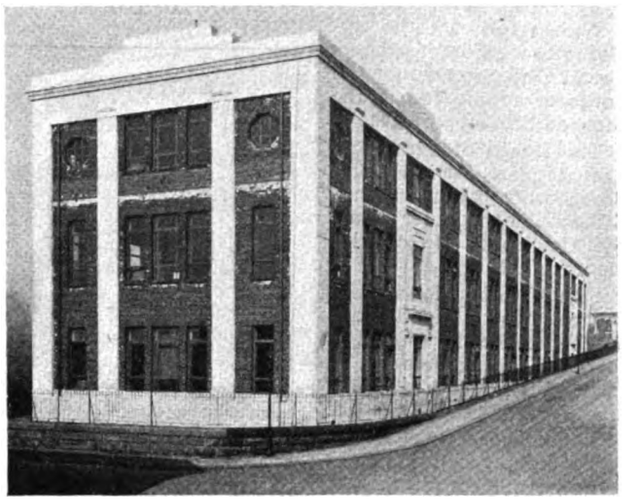
THE JOHN BENN HOSTEL.

Sir Ernest Benn, President, presided over the annual meeting of the East End Hostels Association, at the John Benn Hostel, on April 11th. In submitting the annual report and balance sheet, he said that it cost £6 000 a year to run the Hostel and the Milner Hall, and, after the usual sources of revenue had been exhausted, they required a further sum of £2 000 which he appealed to all present to assist in raising. Mr. R. McKenna seconded, and the Earl of Feversham, Chairman of the Council, supported the motion.

NEW CABLE OFFICES.

Particulars of New Building Erected for B.I. Cables Ltd., at Prescot.

BRITISH INSULATED CABLES LTD., have recently completed, at a cost of £35 000, a block of offices at the corner of the factory property nearest to Prescot station. The new building, designed by Messrs. Bailey and Nisbett, is



The new building of British Insulated Cables Ltd. at Prescot.

256 ft. long by 42 ft. wide, and consists of a steel framed structure encased in sand-faced red brick, with artificial stone plinth, pilasters, and cornice. Ample daylight is provided by 252 steel windows. The main entrance, at the north end, opens into a hall with main staircase and a passenger lift, giving access to all three floors. A second entrance with a smaller hall is provided at the south end of the building.

On the ground and second floors a central corridor runs the entire length of the building, with rooms opening right and left, borrowed lights being fitted in the corridor walls. The first floor arranged so as to provide in the centre of the buildings an office, 5 100 square feet in area, for the general office staff. There are in all 95 radiators connected to a low pressure central heating ring system, with two steam calorifiers. Domestic hot water is also heated by a steam calorifier, through which passes condensate from the central heating calorifiers.

A feature of the new offices is the lighting, medium sized units in enclosed bowls being used throughout. The wiring was carried out by the company's staff with the "Prescot" wiring system. The decoration of the interior has been treated with due regard for lighting, in that a general scheme of light colours has been adopted, various tints being employed, in order to avoid monotony. The Board Room is flush panelled in Ancona walnut. Electric clocks, controlled by the "Pulsynetic" system, are installed throughout.

ELECTRICAL WOMEN.

Visit to "M.K" and Belling and Co. Works—Branch Activities.

SEEING how "outlets" are made was a matter of interest to about 150 members and friends of the Electrical Association for Women, when they visited the works of "M.K." Electric, Ltd., Edmonton, London, N.18, on April 16th. From machine shop to test sections, each department held attention. Special interest was shown by the visitors in the "anti-flash" switch socket, "double purpose" sockets with safety fuses, and a complete range of switchplugs suitable for the home. After inspecting the "MK" works, the party proceeded to Enfield to Messrs. Belling and Co., where they were entertained to tea, and shown round the works.

Dr. A. Bryce gave a lecture on the subject of "Sunlight and Health" to the members of the Birmingham and Midlands Branch of the Association on April 17th.

On April 11th, Mr. J. W. H. Cooper, of the E.L.M.A. Lighting Service Bureau gave a talk to the Rugby Branch on "Colour Lighting in the Home." Mr. Cooper gave various demonstrations of the effects of good and bad lighting, by means of a model room. The ladies were particularly interested in Mr. Cooper's remarks on the effect of dark decorations, Lantern slides were shown illustrating the effects which can be obtained in modern homes by diffused lighting.

ELECTRICITY SUPPLY.

Bedford and Rural Supply—The Becontree Estate—Lincoln and the Electricity Commissioners—Extensions at Hull.

ROTHERHAM Electricity Committee recommends that the charge per kW to industrial bakeries be fixed at 0·9d.

East Ham Electricity Committee has approved an estimate of £7 290 for laying distributor cables in various streets.

Warrington T.C. is applying to the Commissioners for an Order extending the limits of supply to include three additional parishes.

The Board of Trade has passed plans for the proposed work of laying h.t. cable under the River Colne, by Colchester Electricity Department.

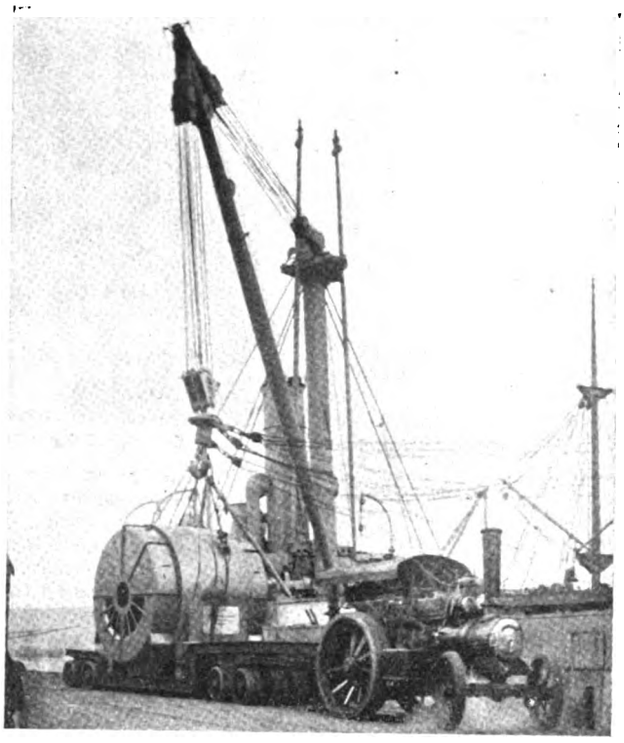
Swansea Electricity Committee has decided that shilling-in-the-slot meters be installed, consumers to be charged 1d. per kW above the prevailing rate.

The Merthyr Electric Traction and Lighting Co.'s new hydro-electric plant at Pont-y-cafnau, on the river Taff, was put into operation on April 6th.

No objection to the proposal of the Paignton Electric Light and Power Co. to spend about £10 000 for extensions in connection with the change over from d.c. to a.c. has been raised by Paignton U.D.C.

Only one application by a tenant of a Colchester Council house for the use of gas for lighting has been received, and, on being informed that an electric slot meter could be installed, the applicant withdrew the request.

Hull Electricity Committee has decided to apply for sanction to loans of £100 000 for maintenance and service, and £50 000 for new sub-stations. — During the last quarter 700 applications have been made to the Electricity Department for wiring.



A PHOTOGRAPH showing the 25-period stator of the 30 000 kW frequency changer which the Metropolitan-Vickers Electrical Co., Ltd., has supplied to the London Power Co. for the Deptford West Station, being loaded at Manchester docks by a steamer fitted with a 100 ton derrick. The stator was lifted by this steamer and swung over to another for conveyance to London. The measurements were 14 ft. 6 in. high by 14 ft. 6 in. wide by 17 ft. 6 in. long. Arrangements were made with regard to discharge whereby the Port of London Authority's 200 ton crane, lifted the stator out of the steamer on to a special trolley, by means of which it was conveyed from the wharf to site.

The Borough Electrical Engineer has reported to Ilford Electricity Committee in reference to the necessary installation of two transformers and switchgear required in connection with the proposed electricity supply to the Claybury Mental Hospital, and has been authorised to obtain quotations for the supply of the necessary electrical equipment and to proceed with the work.

Stirling Electricity Committee has reported to the Town Council that it is estimated that the capital account of the Corporation electricity undertaking will show a debit balance of approximately £1 950 at May 15. The capital expenditure on mains, meters, etc., for the next three years is put at £3 500, making a total of £5 450. The Council has resolved to apply to the Electricity Commissioners for consent to the borrowing of this amount.

At the Town Hall, Bray, Co. Wicklow, recently, Mr. Meghan, the Commissioner who is administering the municipal affairs of the town referred to the taking over of the local electricity supply system by the Shannon Supply Board, said: A charge of £1 192, equivalent to 9d. in the £ on the rates was involved, in addition to the ratepayers losing control of their electricity supply system. The ratepayers could only hope that the Ministry for Local Government would do something for them in the matter.

Barking Electricity Committee has received a letter from the Chief Engineer of London County Council, asking if Barking Council will supply electricity to the houses proposed to be erected on the Becontree Estate if the County Council wires such houses. The Committee recommends the Council to agree to afford the necessary supply, and the engineer is to report fully as to the necessary mains, etc., extensions, including the question of the street lighting of the portion of the Becontree Estate in question.

Leicester Sewage Committee is to adapt the existing store at the pumping station as a transformer house, and to provide a transformer, switchgear and switchboard, electric lighting and heating, and a new store, at an estimated cost of £3 400.

With regard to applications for supply in the villages of Clophill, Maulden and Ridgmont, Bedford Electricity Committee states that though the revenue anticipated during the two or three years following the commencement of supply was not up to the minimum generally regarded by the Committee as necessary, it is believed that when the Ministry of Transport scheme is in operation the requisite revenue will be forthcoming, and it is proposed that extensions to these villages be made at once.

Stoke Newington (London) B.C. has received sanction to borrow £10 000 for electricity mains and services.—The electricity department is to extend mains at a cost of £700 and to instal free wiring at a cost of £422.—The Electricity Committee recommends that the joint committee of representatives of the London and Home Counties Joint Electricity Authority and the Conference of Local Authorities owning electricity undertakings in Greater London be informed that the Council cannot see its way to support the scheme recommended by such joint committee for the co-ordination of local authorities' generating stations and main transmission lines. The Committee remarks that the Central Electricity Board is opposed to the scheme, and the local authorities affected are not agreed as to its desirability.

The Electricity Commissioners have decided to grant the applications of the Yorkshire Electric Power Co. for the Isle of Axholme and District Electricity Special Order, the Yorkshire Electric Power (Eastern Extension) Electricity Special Order, and for a further area for which formal application is yet to be made. This area includes the rural districts of Howden and Riccall, and part of the rural district of Escrick, the unoccupied part of the rural district of Tadcaster and the whole of the unoccupied part of the administrative county of Lindsey (Lincoln) as far south as the existing southern boundaries of Gainsborough and Caistor rural districts. The remainder of the unoccupied area in the administrative county of Lindsey, and the whole of the unoccupied area in the administrative county of Kesteven (Lincoln), is to be granted to Mr. Borlase Matthews.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

DUNFERMLINE CORPORATION, April 26th.—Electric lighting installation, for housing scheme. Schedules from the Burgh Engineer, City Chambers, Dunfermline; deposit £1 1s.

SALFORD CORPORATION, April 26th.—Supply of e.h.t. and l.t. paper insulated, lead covered cable. Particulars from the City Electrical Engineer.

DUNDEE HARBOUR TRUSTEES, April 27th.—Supply and erection of two 3-ton electric, travelling jib, portal cranes at King George V. Wharf, Dundee Harbour. Specifications, etc., from the General Manager and Engineer, Harbour Chambers, Dundee.

WEST RIDING EDUCATION COMMITTEE, April 27th.—Electric light installation in Thorne Council School. Specifications from Mr. E. L. Harrap, Education Offices, Goole.

Meters for Central Scotland Area.

CENTRAL ELECTRICITY BOARD, April 29th.—Supply and erection of electricity meters, in connection with the Central Scotland Electricity Scheme. Specification (No. C.S.-S.S. 14) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

MANCHESTER CORPORATION, April 30th.—Supply and erection of one 33 000 V, 11 500 kVA, self-cooled, outdoor auto-transformer (specification No. 250) and one 6 600 V switch, etc., and a neutral earthing resistance (specification No. 251). Specifications from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each.

SOUTHAMPTON CORPORATION, April 30th.—(1) Steel framed building, platform for fans, overhead bunkers, etc.; (2) two water tube boilers with superheaters, economisers, stokers, fans, soot blowers, etc.; (3) steam, feed water and other piping, etc.; and (4) water softener, at Electricity Works, Western Esplanade, Southampton. Specification, etc., from Mr. W. G. Turner, borough electrical engineer; deposit £2 2s.

STAFFORDSHIRE EDUCATION COMMITTEE, April 30th.—Electric light installation in the Girls' High School, Stafford. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s.

STAFFORDSHIRE EDUCATION COMMITTEE, April 30th.—Electric light and power installation in new High School for Girls, Wellington Road, Bilston. Specification, etc., from Messrs. Moffet, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., May 1st.—Supply of electrical accessories. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, S.W.1.

DEVIZES RURAL DISTRICT COUNCIL, May 1st.—Electric light installation in houses at Market Lavington, Potterne, and Rowde. Particulars from the clerk, Mr. P. R. Trapp, Maryport Chambers, Devizes.

HEYWOOD CHAPEL, NORTHOWRAM, May 1st.—Electrical installation in chapel, school, manse and caretaker's house. Tenders to Mr. F. Rushworth, 24, Back Clough, Northowram.

EPPING GUARDIANS, May 2nd.—Electric light installation at the Institution. Specification, etc., from the Clerk, High Street, Epping.

STEPNEY (LONDON) GUARDIANS, May 2nd.—Installation of X-ray apparatus, refrigerating apparatus and inter-communication telephones. Forms of tender, etc., from the Clerk, Bancroft Road, Mile End, E.1. Stamped, addressed envelope to be sent.

WARRINGTON EDUCATION COMMITTEE, May 2nd.—Specifications, etc., from Mr. J. Moore Murray, Education Office, Sankey Street, Warrington.

GRIMSBY CORPORATION, May 3rd.—Supply and erection of about 10 miles of 33 000 V overhead line. Specification (No. 260) from Mr. S. R. Windle, borough electrical engineer, Grimsby.

MANCHESTER CORPORATION, May 3rd.—Supply, during twelve months, of electric kettles (specification 236), electricity meters(237), air-break circuit breakers (244), star delta switch starters (245), a.c. industrial electric motors (246), potential and current transformers (247), cables (248) and time switches (249). Specifications, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each.

SWANAGE URBAN DISTRICT COUNCIL, May 3rd.—Electric light installation in town hall. Specification, etc., from the Surveyor, Town Hall, Swanage.

WALTHAMSTOW EDUCATION COMMITTEE, May 3rd.—Electrical installation in Billet Road School, Walthamstow. Specification, etc., from Mr. G. R. Spurr, Electricity Works, Exeter Road, Walthamstow, London, E.17; deposit £1.

CENTRAL ELECTRICITY BOARD, May 4th.—Supply and erection of 33 000 V and lower voltage cables, under the South-East England electricity scheme. Specification (No. S.E.E.-G.C.1) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

SOWERBY EDUCATION AUTHORITY, May 4th.—Electric light installation at Sowerby New Road Council School. Specifications, etc., from Mr. A. Beilby, Education Offices, Sowerby Bridge.

EDINBURGH EDUCATION AUTHORITY, May 6th.—Electric lighting installation in Gorgie New Special School and Annexe to Trinity Academy, Bangholm Recreation ground. Schedules etc., from the Education Offices, Castle Terrace, Edinburgh.

ISLINGTON (LONDON) BOROUGH COUNCIL, May 6th.—Supply and installation of two lead batteries for Edison refuse collecting vehicles, having carrying capacity of 3½ to 4 tons, Further particulars from the Cleansing Superintendent, Liverpool Road, N.1.

WALTHAMSTOW URBAN DISTRICT COUNCIL, May 8th.—Supply of (*a*) l.t. distributor and service cables, and (*b*) e.h.t. and l. t. feeder cables to contract No. 66. Specifications from Mr. G. R. Spurr, Electricity Works, Exeter Road, London, E.17; deposit £1 for each.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(a) Main 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 1 500 000 kVA; (b) auxiliary 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 500 000 kVA, with group feeder reactors, for Ironbridge power station. Specification (No. 4) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(1) One 50 000 kW turbo-alternator, with step-up transformers, etc.; (2) condensing plant, boiler-feed pumps, evaporators, etc.; (3) circulating water pumps, etc., for Ironbridge power station. Specifications (No. 2) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

HULL CORPORATION, May 16th.—Supply and laying of underground cables. Specifications, etc., from Mr. J. N. Waite, city electrical engineer and manager, Electricity Works, Sculcoates Lane, Hull; deposit £2 2s.

CHERTSEY GUARDIANS, May 18th.—Electric lighting installation at the Institution, Ottershaw, near Chertsey, Specifications from Mr. F. J. Warcham, clerk, Council Offices, West Byfleet, Surrey.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

JOHANNESBURG MUNICIPALITY, April 27th.—Supply of steel tramway poles (contract No. 154). (Reference A.X. 7 728.)

IRISH FREE STATE ELECTRICITY SUPPLY BOARD, April 29th.—Supply and laying of 40 000 V cables in the county and city of Dublin. Specification, etc., from Mr. P. J. Dempsey, 60-62, Upper Mount Street, Dublin; deposit £5.

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills, with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

Digitized by Google

NEW ZEALAND POSTS AND TELEGRAPHS, April 30th.—Supply of telephone cable (No. P. and T. 151/1 412). (Reference B.X. 5 240.)

CAPETOWN MUNICIPALITY, May 1st.—Supply of 30 ft. steel poles, cross arms, insulators, fly fuses, etc. (specification 459/1929). (Reference A.X. 7 697.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, May 6th.—Supply of electric motors, turntables, drilling machine, etc. (Reference A.X. 7 765.)

STUDENTS of the Mechanical Engineering Department of University College, Dublin, in the library of the G.E.C. research laboratories, on the occasion of their tour of the Wembley works. They also visited the Osram Lamp Works, at Hammersmith.

WINNIPEG MUNICIPALITY, May 6th.—Supply of switching equipment at Slave Falls. (Reference B.X. 5 250.)

PRETORIA MUNICIPALITY, May 20th (extended from May 6th).—Supply of cables, switchgear and transformers. (Reference B.X. 5 245.)

INDIAN STORES DEPARTMENT, May 21st.—Supply of 400 kW 6-phase rotary converter and accessories for His Majesty's Mint at Calcutta (order No. N./9691). (Reference B.X. 5 255.)

MONTEVIDEO PORTS ADMINISTRATION, May 22nd.—Supply of four electric cranes, to lift 3 tons, mounted on trucks. (Reference A.X. 7 814.)

EGYPTIAN PRISONS ADMINISTRATIONS May 25th.*—One year's supply of lamps and electrical articles (section 7). (Reference C. 3 022.)

AUCKLAND ELECTRIC POWER BOARD, June 3rd.—Supply of cables and accessories. (Reference B.X. 5248.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 18th.—Supply of telephone cords (No. P. and T. 151/1425). (Reference B.X. 5 251.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Supply of one 10-ton and three 4-ton, electric level luffing cranes (tender No. 1 437). (Reference A.X. 7 828.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

Tenders Accepted.

ADMIRALTY.—Edison Swan Electric Co., Ltd., radiators.

NEWTON ABBOT GUARDIANS.—Coulson, electrical installation at the Institution, £530.

TORQUAY CORPORATION.—British Thomson-Houston Co., Ltd., supply of switchgear, £431.

OLDHAM CORPORATION.—W. F. Spencer, fixing hot water heating system at new power station.

LAMPETER CORPORATION.—Lampeter Electricity Supply Co., Ltd., portion of public lighting.

LONDON COUNTY COUNCIL.—Edison Swan Electric Co., Ltd., control battery for Greenwich power station.

HULL CORPORATION.—Drysdale and Co., Ltd., water pump; Bruce Peebles and Co., Ltd., motor converters, £13 115.

DARTFORD URBAN DISTRICT COUNCIL—Hackbridge Cable Co., Ltd., supply of cable, etc., £1 725. (Recommended.)

HENDON URBAN DISTRICT COUNCIL.—Standard Telephones and Cables, Ltd., installation of fire alarm system, £2 901.

GLASGOW CORPORATION.—Barber and Colman, supply of experimental set of automatic traffic control apparatus, £103.

DUMFRIES JOINT SANATORIUM BOARD.—Gordon and Moodycliffe, electric light installation in two houses, £20 12s.

ST. GILES CHURCH TRUSTEES, WEST BRIDGFORD.—W. J. Furse and Co., electrical work in connection with new parochial hall.

PAISLEY CORPORATION.—J. Bell and Son, electric lighting work, in connection with erection of three-storey tenements at Ferguslie.

HALIFAX CORPORATION.—Headen and Brennand, electrician's work in connection with erection of 12 houses at Stretchgate Lane, Pellon.

BRIGHTON CORPORATION.—Mather and Smith, Ltd., brake blocks, £132; British Insulated Cables, Ltd., trolley wire, £228 13s.; Tungstalite, Ltd., lamps, £100.

BINGLEY URBAN DISTRICT COUNCIL.—R. White, electrician's work, in connection with erection of 13 houses at Crossflats, 10 at Cullingworth, 10 at Wilsden and 12 at Harden.

SOUTHWARK (LONDON) BOROUGH COUNCIL.—Alton Battery Co., Ltd., battery plates, £65 7s. 11d.; General Electric Co., Ltd., automatic switches, £74 1s. 9d. for 3 000 A, and £60 15s. for 2 000 A.

SOCIETE BELGE RADIOELECTRIQUE.—Marconi's Wireless Telegraph Co., Ltd., short wave telegraph-telephone transmitter, for communication between Belgium, the Belgian Congo and South America, and two short wave receivers, for the Belgian Government.

CROYDON CORPORATION.—A. Reyrolle and Co., Ltd., transformer pillar for 500 kVA transformer, £132 1s. 9d.; feeder panels, £700 12s. 6d.; transformer switch for 1 000 kVA transformer, £154 19s. 3d.; transformer switches, £278 2s. 6d.; Film Cooling Towers, Ltd., repairs to cooling towers, £155. (All recommended.)

LONDON COUNTY COUNCIL.—Alpha Manufacturing and Electrical Co., Ltd., electric light wiring and fitting at Bentworth Road new elementary school, £268. (Recommended.) Also tendered: Cox-Walkers, Ltd., £275; Ellis and Ward, Ltd., £291; Malcolm and Allan (London), Ltd., £313; A. Hawkins and Sons, £339.

MANCHESTER CORPORATION.—Tudor Accumulator Co., Ltd., repairs to battery at Dickinson Street station; Metropolitan-Vickers Electrical Co., Ltd., oil purifier for Dickinson Street station; C. A. Parsons and Co., Ltd., and English Electric Co., Ltd., static transformers; Titan Trackwork Co., Ltd., tramway special trackwork; J. Blakeborough and Sons, electrical operating gear for valves at Lostock boosting station (for Waterworks Committee).

BIRKENHEAD CORPORATION.—New Switchgear Construction Co., Ltd., one 2-panel transformer cubicle equipment, £141 10s. and three wing cubicle equipments, £298 10s.; General Electric Co., Ltd., three 200 kVA transformers, £372; and one 100 kVA, £82; Mersey tunnel work: British Thomson-Houston Co., Ltd., truck type cubicle, £98 10s.; W. T. Glover and Co., Ltd., cable. Cables: Hackbridge Cable Co., Ltd., £267 10s.; British Insulated Cables Ltd., £380.

BROMLEY CORPORATION.—A. Sutton, electric wiring of 91 houses to be erected on the Southborough housing site, £531. Also tendered:—E. Dyne, £412; J. Vigor, £471; British Electrical Installations, £648; J. H. Plant, £663; Payne Bros., £685; E. Tye, £690; G. T. Bellamy and Co., £708; Telephone Electrical Maintenance Co., £723; Helps Electric, £750; Higginbotham and Sons, £750; Fordham Electrical Engineering Co., £750; G. E. Wallis and Sons, £750; C. E. Pittman, £757; Cross Bros., £757; C. F. Munn and Co., £772; Darlington and Reid, £792; C. Gosling, £822; W. Davey, £827; R. E. Knight, £842; Gardner, Brown and Co., £890; Henfrey Electrical Installations, £908; C. W. Dempster, £910; Tredegars, Ltd., £951; R. G. Knight, £1,408; S. Boskin, £2,900.

LONDON STUDENTS' SECTION I.E.E.

Report of Committee for the Session 1928-1929.

THE report of the Committee of the London Students' Section of the Institution of Electrical Engineers for the Session 1928-29, to be presented for approval at the annual general meeting to be held to-day, shows that ten meetings were held during the session, with an average attendance of 68·5. The average for the 1927-28 session was 76. The number of visits made was 11, the average attendance being 15. The most popular visits appear to be those on Saturday afternoons. The Committee points out that though the attendance at the majority of visits was satisfactory, it was in certain cases disappointing, making it necessary to cancel two visits on account of poor support.

The attendances at the dinner and dance were 130 and 200, respectively, the former being a record for the past six years. The summer meeting was held from July 28th to August 6th, and consisted of a tour through Holland and West Germany, 32 students from London and the provinces taking part.

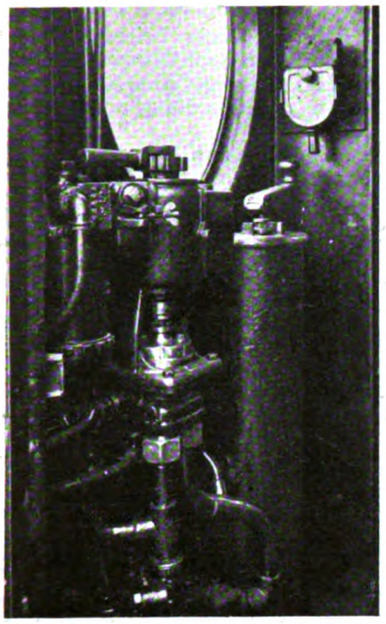
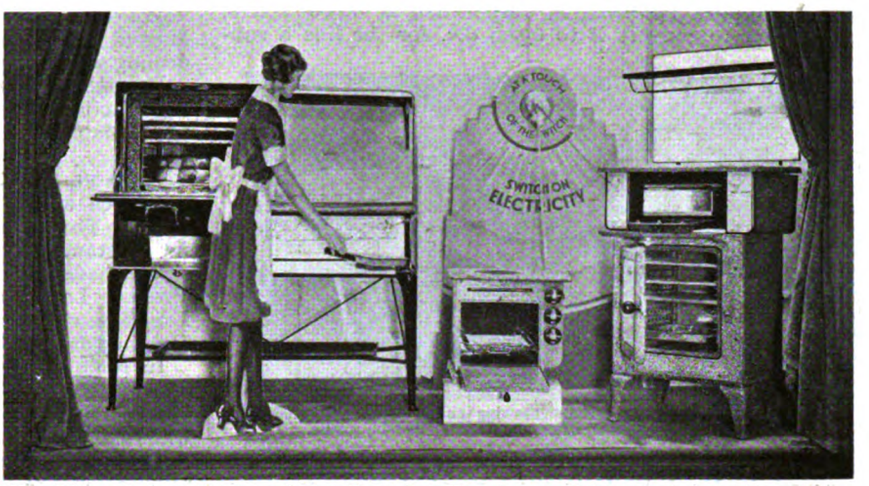
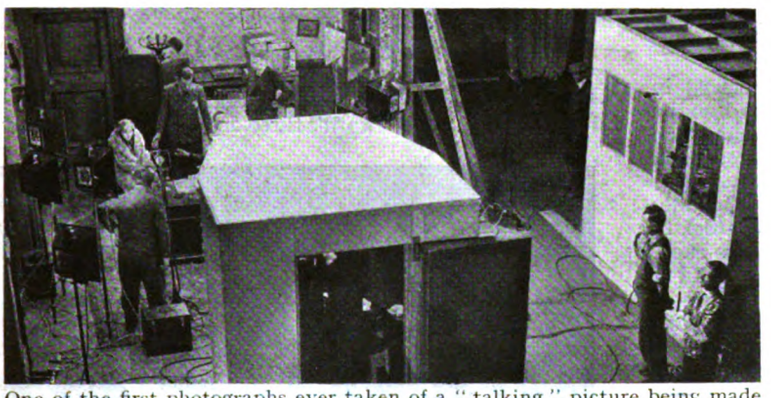
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



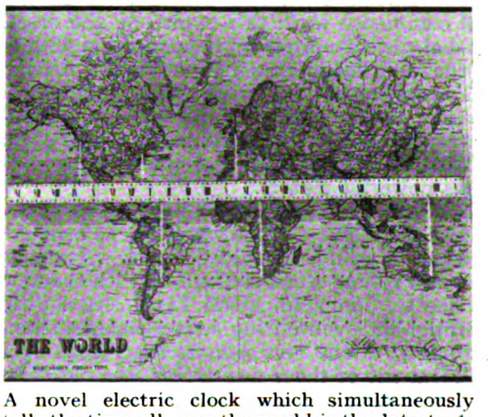
An improved electro-pneumatic brake which has been the subject of experiments by the London "Underground" Railways. It is claimed that with this brake an 8-car electric train can approach a station at 40 m.p.h. and make an accurate stop within two or three inches of a given mark in 20 seconds.



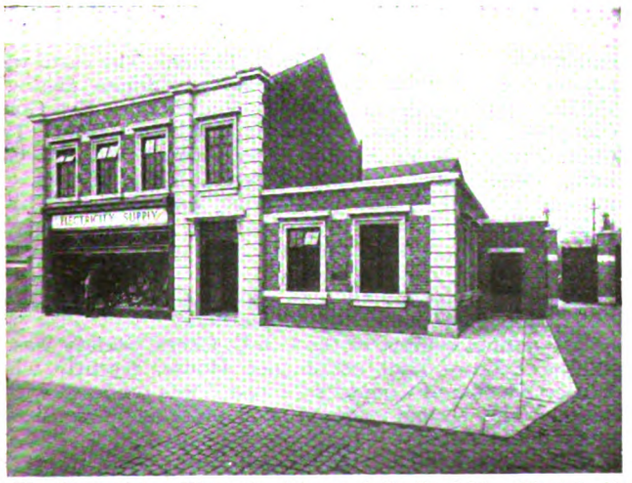
The May window display of the Electrical Development Association, while still preserving the simplicity of previous windows, strikes a new note. It will be remembered that the selling campaign for next month is devoted to electric cooking, and, in order to meet all requirements, the window furniture has been designed so as to allow any make of cooker to be included in the display. The dressing material required, apart from the cooking appliances themselves, is small, and, as may be seen from the picture, is easy to arrange. A background of white paper representing tiles gives to the window the appearance of a modern kitchen, while the figure in the apron adds life to the scene; the "switch," of course, tells its own story.



One of the first photographs ever taken of a "talking" picture being made at the Elstree studios. The camera is housed in the wooden hut seen in the centre foreground, with the sound recording apparatus in the compartment on the right. One of the microphones being used may be seen, close to the director of the operations, to the left of the camera house.



A novel electric clock which simultaneously tells the time all over the world is the latest attraction to be seen at the new Piccadilly Circus station in London. The clock face is a map of the world on Mercator's projection.



The Shropshire, Worcestershire and Staffordshire Electric Power Co. has opened new showrooms and offices at Smethwick. The premises, shown on the left, include a spacious demonstration kitchen, where special lectures on electric cooking will be given. The S.W.S.Co. last week organised a five-day exhibition at Oldbury, the exhibits being displayed in rooms appropriate to the class of goods. A general view is shown on the right, and even at this early date the exhibition is voted a success.

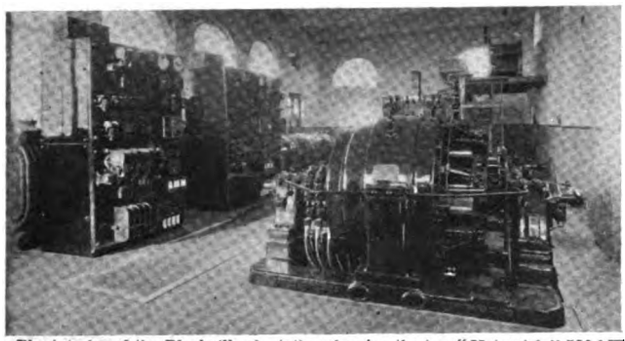
ELECTRIC TRACTION.

Opening of Electrified Mumbles Railway and Automatic Sub-Station.

IN connection with the opening ceremony of the electrified Mumbles railway, on April 18th, it is interesting to note that power is supplied by Swansea Corporation at 6 600 V a.c., and in order to convert it to 6 500 d.c. for the line a sub-



The interior of the Blackpill sub-station showing the two "Metrovick" 500 kW rotary converters with their automatic starting and relay panels.

station has been provided at Blackpill, the arrangement being made by Mr. J. W. Burr, the borough electrical engineer. The sub-station arranged for fully automatic control includes two 500 kW rotary converters, which, together with the a.c. and d.c. switchgear, a negative booster set, and the automatic control gear for the whole of this equipment have been supplied by the Metropolitan-Vickers Electrical Co., Ltd.

The Minister of Transport has approved of the extension of Sunderland tramways on the Durham Road to Humbledon Hill.

The L. and N.E. Railway and the L.M. and S. Railway will commence work this month on the erection of the overhead electrical equipment in connection with the electrification of the Manchester South Junction and Altrincham line.

Twenty more re-equipped cars have now been placed in service in the northern and western section of the London Metropolitan Electric Tramways. The lighting has been considerably increased, and the cars have been fitted with more powerful motors.

Nine new trains have been put into service on the Piccadilly (London) Railway. The whole of the original rolling stock of this line is being replaced by 27 new trains of six cars each. The new rolling stock is identical with the new cars already in service on the Hampstead Line. In addition to improved lighting and ventilating arrangements, the new cars have automatic doors. As soon as the Piccadilly Line has its full complement of these new trains, the old rolling stock on the Bakerloo Line will also be replaced.

The Ministry of Transport inquiry into Bradford Corporation's application for a Provisional Order authorising the running of railless trolley vehicles over 29 routes in the city and 11 outside was held recently by Mr. A. D. Erskine. Mr. J. G. Gunter, deputy town clerk, said Bradford had now 37 trolley vehicles running on 15 miles of route, all in the City except some 1 500 yards. On all the proposed 40 routes, except 8, tramways were in operation. Mr. R. H. Wilkinson, tramways manager, said the granting of the Order would not necessarily mean that all the tram routes would be converted, The cost of reconstructing the tram track would be £916 000. and of preparing for trolley cars, £226 000. Mr. J. E. Lightburn, representing the County Council and several urban district councils, said the proposed trolley vehicle service would add to the cost of upkeep of roads and would add to the number of danger points. The County Council asked for a complete veto on poles on the highways. They had strong objection to some of the proposed turning points, which would annul to a degree the benefit for which they looked from their widening schemes. The inquiry was closed.

AN ELECTRIC POULTRY FARM.

The March issue of "Rural Electrification and Electro-Farming" gives particulars of a farm near Edinburgh, where 100 000 birds produce some 15 000 000 eggs per annum. The mixing of poultry meal, the plucking of killed birds, and heating of water tanks are carried out by electrical means, while each laying house is illuminated by electric light controlled by two switches, and a special dimming device for extending the hours of "daylight" during winter months.

TRADE PUBLICATIONS.

GENT AND CO., LTD., Faraday Works, Leicester, have sent us Book 5/Section 2c relative to electric turret clocks.

PHILIPS' LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, has issued leaflet No. 402, describing and illustrating "Phililite" diffusing units.

We have received from the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, folder O.S.4759, dealing with automobile lamps.

FERRANTI, LTD., Hollinwood, Lancs, has published a new constructional chart of the "H.T. Supply Unit No. 5." This unit complies in every respect with the requirements of the I.E.E.

KLAXON, LTD., 36, Blandford Street, London, W.1, has published a special booklet dealing with industrial Klaxon horns. The instruments are motor driven, and are suitable for all standard voltages.

We have received from BRITISH INSULATED CABLES LTD., Prescot, Lancs, a new bell wire price list which replaces L.24/6, a new list of manufactures which replaces P.220, and P.246 dealing with pole materials, which replaces P.208.

In reply to the leaflet "Atmosphere" which, written by one of the staff of VENNER TIME SWITCHES, LTD., of 45, Horseferry Road, London, S.W.1, was published some little while ago, the company has issued a further leaflet entitled "The Beginning of Our Atmosphere." The authors of the latter publication are Messrs. Robert C. Graseby and Ernest E. Sharp.

The MULLARD WIRELESS SERVICE CO., LTD., Mullard House, Charing Cross Road, London, W.C.2, has issued catalogue leaflets Nos. V.R.85, V.R.81, V.R. 54/1, and V.T.17/1 illustrating valve types, P.M.6, P.M.1 H.F., P.M.256, and DO/40 respectively. These leaflets replace V.R.55, V.R.47, V.R.54, and V.T.17, which should be destroyed. Two new leaflets, Nos. V.R.73 and V.R.77, illustrating valve types D.F.A.9 and DO/20 respectively, are also available.

THE SOCIAL SIDE.

ON April 15th, at the Balfour Institute, Smithdown Road, Liverpool, the A.T.M. Dramatic Society gave a very successful rendering of Noel Coward's three-act comedy, "Hay Fever,"

A scene in the comedy, "Hay Fever," as performed by the A.T.M. Dramatic Society.

under the production of Mr. Thos. Fisher. The caste was as follows:—Sorel Bliss, Gretta Downie; Simon Bliss, Will Faulkner; Clara, Freda Blundell; Judith Bliss, Eva Gordon-Campbell; David Bliss, Leslie F. Whyman; Sandy Tyrell. Chas. Plank; Myra Arundel, Lily Searle; Richard Greatham, Thos. Fisher; Jackie Coryton, Molly Keddie. The musical portion of the programme was furnished by the A.T.M. Orchestra, some 30 strong, who gave selections from Gilbert and Sullivan, under the able direction of Mr. C. Brandreth.

Reading Tramways football club has reached the final of the Reading mid-week cup competition.

The annual concert of the G.E.C. Choral Society was held in the Lecture Hall at Magnet House, recently, when a concert version of Gounod's "Faust" was rendered with fine effect. The second part of the programme consisted of songs and choruses.

The Greenwich Cable Works, Ltd., held a function recently at the Ship Hotel, Greenwich, to celebrate the forthcoming change from the present works to new works at Croydon. Mr. J. H. C. Brooking was in the chair, and during the evening a number of prizes were given for dancing, humorous songs, and a Limerick competition.

COMPANY NEWS.

Appreciation of General Electric Shares—Great Northern Telegraph's 20% Distribution—Associated Electrical Industries' Dividends—Official Quotations Granted—Marconi £1 Shares—Directors' Reports—New Companies.

THE dropping of the General Electric Co.'s proposal to issue new "British" ordinary shares has been followed by an improvement in the market price of the existing ordinary shares to £3 5s., which is 3s. 9d. higher than the quotation a week ago. County of London Supply shares have been bought, and at £2 15s. 6d. the price is 3s. 6d. up on the week. Brompton and Kensington shares have eased off 6d. Marconi International Marine shares have risen half-a-crown, but Marconi's Wireless are unchanged. English Electric shares are a further 7½d. down at 6s. 3d.; Ever Readies are 6d. to the good. District and Metropolitan Railway ordinaries are down a half, and Underground Electrics have lost the 6d. gained last week.

(on acct. of wh. 4% has bn. paid) and 7½% for year on "B" ord. shs., blce. £92 621, has been carried to appropriatn. acct., res., wh., with premiums on cap. issues during year and contributions from consumers in respect of new services, amts. to £150 266. Out of this amt. is proposed to write off commissns. and discts. in respect of issues of cap., £18 937; to devote to inauguratn. of endowmnt. fund, £2 392; to place to res. £5 000, and carry fwd. £78 937.

THE new lighting installation at St. Peter's Church, Ealing, London, has been completed by Messrs. Honor Bros., electrical contractors, Ealing, to the designs of the General Electric Co., Ltd. The superiority of electricity over gas as a lighting medium is illustrated by these two pictures, which show on the left the old gas installation, with the new system on the right. The wiring has been carried out by means of 2 500 megohm grade Pirelli-General cable in screwed conduit. Floodlights, installed at clerestory level, are used for nave and chancel lighting, being equipped with 200 W white bowl-sprayed gasfilled lamps. The side aisles are illuminated by silvered glass reflectors fitted with 100 W and 150 W lamps of a similar type. The Lady Chapel is illuminated on the same lines.

THE CABLES AND WIRELESS MERGER.—The directors of Cables and Wireless, Ltd., have announced that the offer to the sh. and stk. hldrs. of the cable co.'s and Marconi's Co. will be conditional on its being accepted within a prescribed time by the hldrs. of 60% (or such smaller percentage, if any, as may be approved by the Government) of the amt. of stk. or number of shs. in ea. of the followg. four classes: Eastern Telegraph ord. stk., Eastern Extension ord. shs., Western Telegraph ord. shs., Marconi's Wireless Telegraph £1 pref. and £1 and 10s. ord. shs. The transfer books of the Eastern Extension Australasia and China Telegraph Co., the Eastern Telegraph Co. (so far as they relate to the ordinary stk.), the Western Telegraph Co. and Marconi's Wireless Telegraph Co., Ltd., will be closed from Apl. 30 to May 21, inclusive, in connection with the forthcoming offer of exchange by Cables and Wireless, Ltd.

GENERAL ELECTRIC CO.'S ALL-BRITISH SHARES PROPOSAL.—The proposed issue of 1 500 000 £1 new British ord. shs. has bn. abandoned. On Apl. 19 the followg. letter, signed by Sir Hugo Hirst, was issued to the shhldrs.:—"Certain proposals for which I have made myself responsible in connection with the finance of the General Electric Company, Ltd., have become the subject of an acute controversy on a stage much wider than that of the company itself. These proposals were made with the sole object of increasing the prosperity of the company, of which I have been for many years the chairman and managing director, and were prompted by my view that a preponderating interest in our great industry should always be in British hands. I have always held the view that our scheme did not prejudice the property rights of or act unfairly towards any of our shareholders. Nothing was further from my mind or that of my colleagues, and we have no such intention. However, under all the circumstances of the case, with the assistance of the British, Foreign and Colonial Corporation, it has been decided not to proceed with these proposals. We are certain that the general problem which such proposals has raised must receive consideration from eminent financial and economic authorities. This step, therefore, has been taken with a view to enabling that study to take place in a clear and calm atmosphere. I am sure that ultimately a way will be found to reconcile the needs of national industry with the requirements of any international obligations."

Company Meetings.

CLYDE VALLEY ELECTRICAL POWER CO.—A mtg. was held on Apl. 24 to consider a proposal to create and issue 900 000 £1 ord. shs. and to cancel 200 000 unissued cum. 2nd pref. shs., the new shs. to be issued to existg. shhldrs. in the proportn. of three for every four now held.

PARA ELECTRIC RAILWAYS AND LIGHTING CO., LTD.—Sir Francis M. Voules, presiding at the meeting on Monday, said the net result for the past year, after deducting debenture service and London office expenses, amounted to £28 803, to which was added the balance of £5 698 brought forward from last year. After providing £10 000 for depreciation and renewals reserve, they were able to pay an interim dividend of 3%, and a final dividend of the same amount on the preference shares.

LANARKSHIRE TRAMWAYS CO.—Mr. A. R. Monks presiding at the meeting. last week, said the revenue was £133 908, a reduction. of £5 419. Revenue from motor buses showed an increase, but did not fully compensate for the loss in tramway revenue. The company was seeking powers under a Provisional Order to abandon its tramways in sections as and when they satisfied the Minister of Transport that it was just and expedient to do so, to cancel the wayleaves and other obligations in connection with the tramways, to restrict motor 'bus competition, etc.

BIDEFORD AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Sir Hugh Stucley, presiding at the meeting on April 10, said the past year had been one of continued progress. The extension to Appledore had proved a fruitful source of further revenue, and the directors were now considering the extension of the mains to Instow by laying a cable from the Appledore side of the river, should they find the necessary support forthcoming. The dividend on the ordinary shares was increased from 4% to 5%, in addition to the 7% on the preference shares, and it was resolved to reduce the cost of current by 10% from July 1 next. The present charge for lighting was 10d.

BATH ELECTRIC TRAMWAYS, LTD..—Mr. E. H. R. Trenow presiding at the meeting on April 15th, said the traffics and earnings for the past year showed a decrease of £1 505. Working expenses had gone down £2 102, the net result of their operations in Bath being £500 better. They were still working under the Temporary Increase of Charges Act, which enabled them to charge fares approximately 40% above pre-war rates. Wages and materials were roughly 80 to 100% higher. They recommended the payment of a dividend of 3½%, the same as last year. On dividend reserve account they were carrying forward £636, while on revenue account the amount taken to next year was £3 793. A dividend of ½% on the preferred ordinary shares was approved.

New Companies.

BEAM SIGN CO., LTD.—Cap., £2 000. Dealers in electrical or other display pictures or signs, manufacturers of and dealers in wireless sets, etc. Reg. office: 20, Kingsway, London, W.C.2.

HENRY BILLINGS AND SONS, LTD.—Cap., £10 000. Electrical and general engineers, electricians, suppliers of electricity for all purposes, manufacturers of and dealers in electrical apparatus, etc. Solicitors: W. G. Christians and Son, Swansea.

SOUTH-EAST YORKSHIRE LIGHT AND POWER CO., LTD.—Cap., £50 000. Electric light, heat and power supply company, electrical engineers, electricians, manufacturers of electrical apparatus, etc. Reg. Office: 53, Cornhill, London, E.C. (Public Co.)

EDISON STORAGE BATTERIES, LTD.—Cap., £12 000. Electricians, electrical and mechanical engineers, manufacturers of and dealers in electric batteries, dynamos, lamps and all apparatus connected with the generation, distribution, and employment of electricity. Reg. office: Victoria House, Southampton Row, London, W.C.1.

TRANSMUTOGRAPH, LTD.—Cap., £130 000. To acquire from J. P. Naylor exclusive licence for U.K. to manufacture and vend his invention called the "Transmutograph," and to carry on business of suppliers of and dealers in electrical, luminous, and other signs, signalling apparatus, etc. Reg. office: Adelaide House, King William Street, London, E.C. (Public co.)

THE LEAD MARKET.

The lead market had an easier tone at the beginning of last week, prices falling away 6s. 3d. per ton, but, according to James Forster and Co., a firmer tone developed later and the loss was more than recovered. The American price was again lowered on April 15th to 7 cents. per lb.

Closing prices on April 19th were £24 16s. 3d. for April, £24 11s. 3d. for May, £24 7s. 6d. for June, and £24 5s. for July, 6s. 3d. to 2s. 6d. per ton higher on the week.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]
